The India Rubber World

VOLUME LXI
October, 1919, to March, 1920

VOLUME LXII
April, 1920, to September, 1920

New York:
THE INDIA RUBBER PUBLISHING CO.
1920

Vol. LXIII

OCTOBER 1, 1920

No. 1

A

Accelerators, Ti, Cordell and Nugent.....	297
Accelerators, Notes on.....(<i>Henry P. Stevens</i>)	719
Organic, Effect of, on the Vulcanization Co.....	1137
Reactions of, During Vulcanization.....	206
"Vulcan".....	716
"Wol-Ko-ene".....	424
"Accident," The Goodyear Vulcanization.....	633
Accidents in Factories.....(<i>Editorial</i>)	633
Accumulator, Hydraulic.....	363
Adhesive, Gum, for Airplane Gasoline Tanks.....	726
Adjudicated Patency.....	626
Airplane Gasoline Tanks, Rubber Armor for.....	726
Airplanes, Radio Head Set for.....	1156
Africa, British, Cotton in.....	714
African Notes.....	536
Air Bag for Tire Repair, Repairable.....	681
Improved.....	659
Bags, Endless.....	365
Bags, Rubber, for Airplane Gasoline Tanks.....	726
Fords Not as Yet.....(<i>Editorial</i>)	536
"Peds" for Heels and Soles.....	434
"Airplane" Back, Protection.....(<i>Book Review</i>)	583
Akron-Williams, Tire Repair, Novelties.....	168
Aling, W. S. (Obituary—Portrait)	583
Aluminum Alloy Molds for Rubber Articles.....	411
Aluminum, Rubber, Molded.....	411
Latex Cups.....	435
ALWYS-SCHMIDT, L. W.....	
Aluminum, Rubber, Industry, Effect of Location on Prosperity of.....(<i>Chart</i>)	407
Cost Accounting in Rubber Production.....(<i>Chart</i>)	342
Influence of Present Exchange Situation on Competitive Position of American Rubber.....(<i>Charts</i>)	281
Tire Fabric and for Airplane Gasoline Tanks.....	640
"America, for a Better".....(<i>Book Review</i>)	438
Western North, A Rubber Plant Survey of.....	230
American Chemical Society.....	
Rubber Division Meetings.....287, 376, 498, 719	
Export Practice, Standard.....	345
Plantation Rubber.....(<i>Editorial</i>)	633
Rubber, for Cars.....	726
Prosperity of.....(<i>L. W. Alwys-Schmidt</i>)	407
in Foreign Fields, Influence of Present Exchange Situation on Competitive Position of.....	281
Plantations in Mexico.....(<i>Editorial</i>)	201
Reserve, An.....(<i>Editorial</i>)	202
Society for Testing Materials, Annual Meeting.....	596
Amsterdam Rubber Market.....119, 258, 393, 466, 542	
Antwerp Rubber Arrivals.....118, 289, 329, 395, 468, 695, 714	
April.....(<i>Editorial</i>)	134
Apron, "Miladi Dainti".....	95
Arch Support, Pneumatic.....(<i>Editorial</i>)	757
Artistic, Making, for Airplane Gasoline Tanks.....	726
Artistic, Making, by Machinery.....	805
Artistic Mold Work.....(<i>Arthur C. Squires</i>)	216
Asia, Rubber, for Airplane Gasoline Tanks.....	726
Asphalt, German Synthetic.....(<i>Editorial</i>)	134
Assuring the Crude Rubber Supply.....(<i>Editorial</i>)	785
Australia, Rubber Trade in.....	74
Austri.....	74
Auto Baby Crib, Gordon.....	836
Automobile.....	
Vulcanizing and Varnishing Machine.....	738
Automatic Lathe for Cutting Rubber Washers.....	656
and Mixer, Banbury.....	735
Pigment Weighing Machine.....	745
Tire-Building Machine and Loom, Schaeffer.....	737
Automobile Accessories.....	589
and Gasoline Engine Encyclopedia.....(<i>Book Review</i>)	33
Fan Belt.....	737
Step.....(<i>Book Review</i>)	33
Stap-Plates or Running Board Mats.....26, 94, 94	
Top "All-weather".....157, *300, *589, *662	
"Duratop".....	591
"Duxraire".....	135
Automobiles, Antislare for.....	515
Automobiles, for.....	515

R

Babeos, Edward S.	(Portrait and Sketch)	450
Baby Crib, Auto.		*93
Pants, "Jiffy"		*157
"Kewpie"		*433
"Utility Fitwell"		*93
Bacon, H. M.	(Portrait and Sketch)	41
Bait, Artificial		*589
Fish, Molded Rubber.		*662

*Illustrated.

"Bufflovak"

Vacuum Dryers for Rubber

There is ONE SURE WAY to keep yourself from being disappointed when buying vacuum dryers—and that is to ADHERE to the policy of buying quality. Even though you may pay a little more at the start, you are sure to PAY LESS in the end.

"Bufflovak" Vacuum Dryers

Vacuum Shelf, Rotary and Drum Dryers
Impregnating Apparatus—Condensers
Dry Vacuum Pumps
Solvent Reclaiming Apparatus

"Bufflovak" Evaporators

All types and for any capacity

"Bufflokast" Chemical Apparatus

Apparatus furnished for all standard chemical operations, such as nitration, reduction, denitration, sulphonation, caustic fusion, crystallization, etc. Complete chemical plants.

No. 1.

SUBSCRIPTIONS: \$3.00 per year, \$1.75 for six months, postpaid, for the United States and dependencies and Mexico. To the Dominion of Canada and all other countries, \$3.50 (or equivalent funds) per year, postpaid.

ADVERTISING: Rates will be made known on application.

REMITTANCES: Should always be made by bank draft. Post Office or Express money order on New York, payable to THE INDIA RUBBER PUBLISHING COMPANY. Remittances for foreign subscriptions should be sent by International Postal Order, payable as above.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

TABLE OF CONTENTS ON LAST PAGE OF READING.**THE MEXICAN RIDDLE.**

DURING THE LAST EIGHT YEARS Mexico has been more or less a land of mystery. All manner of conflicting rumors regarding the political and economic situation have come forth from that country of revolution and counter revolution. Accurate reports have generally been lacking, but it is well known that gross injustices have been committed upon American citizens and against American property rights which have brought about a virtual paralysis of American enterprises of all sorts in that country and have necessitated the abandonment of vast acreages of rubber and various agricultural products.

With the formation of the National Association for the Protection of American Rights in Mexico and the organization of a concerted effort to remove the causes of friction between the United States and Mexico, the public will hear more accurately of developments below the Rio Grande, and there is hope that something worth while may be accomplished.

Political affairs appear to be nearing a crisis in Mexico, and it is believed either that the Mexican people

will stabilize conditions sufficiently within a year or two to give adequate protection to foreign capital and industries, or that it will be done for them. Mexico has much that the world needs badly, and it is reasonable to suppose that the world will secure these commodities through intervention and the establishment of a protectorate, if necessary to ensure stable conditions.

Meanwhile far-sighted Americans will cultivate closer social relations with the better class of Mexicans; study their needs and customs and lay the foundations for future business, for not in years has the sentiment of large Mexican commercial interests been so favorable to better business relations with the United States.

SIMPLIFIED CHEMICAL NAMES.

THE RUBBER INDUSTRY welcomes the determination of the Council of the American Chemical Society to confer with the Chemical Society of England and the Society of Chemical Industry in an effort to promote uniformity in the names of chemicals and their spelling and pronunciation in the interest of clarity and for the purpose of facilitating commerce and industry.

Until recently the rubber industry has been relatively free from names of troublesome length and difficult pronunciation. With the advent of organic accelerators, however, which followed in the train of synthetic rubber experiments, came many new chemical names formidable enough to stagger anybody other than a chemist familiar with their derivation and meaning. For example, parinitroso dimethylaniline, hexamethylene tetramine, thiocarbanilide and paraphenylenediamine are a few of names of commonly used organic accelerators. Whatever indicative value such names may have for the analytical chemist, they are certainly a nuisance to the practical rubber man and the purchasing agent, and suitable shorter equivalents for everyday use are desirable.

EMPLOYING THE DISABLED SOLDIER.

EMPLOYING OUR SOLDIERS disabled in the late war and making them self-supporting and self-respecting is a theme frequently enlarged upon and which is worth while emphasizing again. The president of a large rubber company has set an example to which the attention of all is respectfully called. In seeking a solution of his own labor shortage, he instituted a careful analysis of every process in his factory. A card record was made of each operation in which a cripple could be used, and special mechanical arrangements of a simple and practical character were designed to facilitate the work and to overcome the disablement.

Many lines of employment were found open in electrical lines also, and the particular jobs in which disabled men could be used have been carefully listed. Over 80 per cent of the men injured in the great war have been provided for by the Allies and what has been done abroad

can certainly be accomplished here. Of this number the British declare that fully 60 per cent of injured men had been reinstated in their old positions. The results of rehabilitation are declared to have been satisfactory in most instances.

SENDING THE FOREMAN TO SCHOOL.

A TIMELY AND INVALUABLE SUGGESTION for the improvement of the human factor in large manufacturing plants has been made by John Calder, M.E., in an address before a editorial conference in New York City. In brief, Mr. Calder advocates a systematic course of instruction for foremen, and supports his suggestion with logic that should appeal to every thinking employer. He said in part:

"We now know that human engineering, tackled in spots only, such as safety, welfare and employment, has been, as a whole, neglected in industry where it counts most. . . . The foreman's education has been sadly neglected and yet he is the man, and the only man in authority, who makes contact with our workmen through half of their walking hours. . . . Not only must we cultivate more intensively in every plant and industry the modern production methods now highly elaborated, but we must set about to greatly enlarge the intelligence of those who must carry out these methods, namely, the foremen, the non-commissioned officers of industry. This is of great importance. No ideas are of much lasting benefit in any plant unless they are well told to the foremen and only a mere fraction of the present-day literature on how to analyze and handle the human factors in industry is intelligible to the foreman who must do this work in detail."

Mr. Calder then relates how courses of instruction for foremen and heads of departments begun a few months ago now number several thousand men, devoting themselves to this class of study for three months at a time.

"Sending the foreman back to school at the expense of the employer is a new idea to most owners, who have been willing to spend money on things much less worth while," he says. "But if that school is held in an employer's own plant, aims at a definite objective and makes a family party of the occasion it is found to be a most fruitful source of enlightenment and enhanced good will. . . . The art of management and supervision has been well worked out to date, so far as the chief executives are concerned, and it calls for an ever-increasing and high order of ability. It has sometimes been inclined to belittle the foreman and at other times to ignore him. Yet we have a fair supply of good managers to-day and are calling loudly not for them or for advisory engineers, but for competent foremen, not merely to criticize but to supervise successfully and to 'deliver the goods,' with the only kind of help now available, at a cost that makes good business and with due regard to the aspirations and interests of labor.

"It is to discover this man in each plant, to develop him where known, to create an interest in his job and to retain that interest, both in it and in his employees, that this educational movement has been specially prepared and offered as something new and necessary at this epoch in our industrial history."

BRITISH INSTITUTE OF PATENTEES.

THROUGH THE ORGANIZATION of a body to be known as the Imperial Institute of Patentees, British patentees and patent owners hope better to guard their interests and to effect desirable modifications in existing patent law. Among its objects are to procure an extension of the life of those patents which have been held up during the war by controlled firms; to assist patentees who have failed to find other support, and to reduce the high cost of a British patent, which is \$500 for a term of fourteen years as contrasted with \$35 for a 17-year patent in the United States.

The new organization has the support of the National Union of Manufacturers, the Federation of British Industries, the Associated Chambers of Commerce, and others interested in better patent laws, and would seem to be in a position to accomplish much in the interests of British manufacturers that will facilitate reconstruction in Great Britain.

FOREIGN TRADE-MARKS SAFEGUARDED IN JAPAN.

A DECISION OF GREAT IMPORTANCE to exporters everywhere is that of the Supreme Court of Japan, in a suit instituted by a Philadelphia manufacturing company for the protection of its trade-mark rights, which upholds in every essential and without qualification the validity of American trade-marks properly registered as guaranteed under Japan's treaty with the United States. It also protects trade-mark owners in every country having similar treaty agreements with Japan against native infringement.

This decision, epochal in world trade and exemplifying international fair play, places the spirit of Japanese law on the highest plane and favorably affects manufacturers whose annual product runs into billions of dollars. By this act Japan has benefited herself immeasurably, for safeguards against the forgery and plagiarism of trade-marks have great significance in international trade. Good-will has a higher commercial value today than ever before in history.

WEARERS OF RUBBER SHOES IN MOSCOW, RUSSIA, MUST pay to the local Soviet a tax of 20 rubles (\$10.30) per pair. The shoes cost the victim 300 to 400 rubles (\$154.50 to \$206). No doubt there is a law compelling the bourgeois to wear them, else there would be small tax returns from this item.

Salvaging, Sorting, and Stripping Tires.

THE VAST NUMBER of automobile tires discarded by the motoring public includes a notable percentage capable of yielding considerable additional mileage at low cost when re-built. In fact, the business of tire rebuilding is becoming nation-wide in extent and increasing in volume. The great unrepairable mass of old tires contains also a large tonnage of salable fabric of great value, useful for many manufacturing purposes.

The salvaging operations on rejected automobile tires provide profitable work for rubber scrap dealers who are developing it to the uttermost. The large scrap dealers are specializing extensively in automobile tire scrap. It is their business to receive old tire stocks from the collectors and sort them into the recognized grades of the waste rubber market. These are officially described in the circular E of the National Association of Waste Material Dealers and listed in the order of their relative value. (See THE INDIA RUBBER WORLD August 1, 1919, page 658.) The grades and current prices are: standard white auto, 5½ cents; standard mixed auto, 5 cents; stripped, unguaranteed, 4½ cents; white G. & G. (Goodrich and Goodyear), 5½ cents; white M. & W. (Morgan & Wright) and White, U. S., 5½ cents.

SORTING OLD TIRES.

Sorting old tires is not a highly specialized operation but a simple matter of skill in inspection and quick individual handling. The most expert sorting is picking out guaranteed makes suitable for rebuilding which means selection of tires with perfect beads, only minor defects of fabric, a limited number of small blow-outs, and no rim cuts or loose plies.

Repairable tires are graded into No. 1 inners, which are good stripped carcasses; No. 2 Inners, containing only a single blow-out; and the ordinary repairables with more than one blow-out. Repairable tires are sold on a graded price-list according to damaged condition, the price running from 8 to 15 cents per pound. All unrepairable tires are subjected to the processes of dissection for salvage of fabric and separation of the various rubber scrap qualities used by the trade.

BEADING OLD TIRES.

The first operation is the removal of the bead from the casing. This is quickly accomplished in a simple machine known as a bead trimmer.

The tire is thrown over the machine and rests on a series of rollers. On one side it is slipped over a crowned roller which fits the inner surface of the tire, while on the outside at the corresponding point is a circular knife. Pressure on a foot treadle revolves the tire by action of the crowned roller inside the tire and sends the circular knife downward through the tire side-

wall just above the bead, which is rapidly severed, allowing its removal by the operator. The tire is reversed and by repetition of the operation the other bead is removed.

From the beading machine the carcass passes on to receive preparation for the operation of pulling out the fabric plies. This preparatory operation is starting the plies by hand.

STARTING THE PLIES.

The conveniences for starting the plies of a bead-free tire carcass are extremely simple. They consist of a stout timber about five by eight-inches and two feet long, supported horizontally

at a convenient height for working. The tools consist of a screw-driver with a short blade, a short knife with the point curved after the manner of a pruning blade, and a heavy pair of ordinary hand-nippers.

The stages of the work of starting the plies are shown in succession in the illustration, beginning in the background.

The worker places the carcass upon the beam or support, then depresses it as he turns it half inside out near the blow-out. Next he holds it securely in position on the support by resting a portion of his weight in the lower loop of the carcass, while with the point of the knife he cuts through the number of plies, three for example, which are to be started up for stripping. The cut is made near the blow-out and the plies separated across by means of the screw-driver. Once started, they are pulled back with the nippers a distance of about a foot. Following this the carcass is cut apart at a point just beyond the blow-out and is thrown aside ready for the pulling machine.

PULLING FABRIC STRIPS.

There are various machines used for pulling tire fabric from the carcass. They comprise means for holding the tire and for seizing the free ply-end, also a power connection to effect the separation. Some pulling machines are arranged to separate the plies in long lengths from the endless tire, and others operate on cut tires. The one shown in the illustration is of the latter type.

(The Latexental Co.) CUTTING BEADS FROM TIRE CASINGS. A PARTLY SEVERED BEAD IS SEEN CURVING UPWARD FROM THE CIRCULAR KNIFE, AND IN THE BACKGROUND IS A PILE OF CUT BEADS.

(The Latexental Co.) STARTING FABRIC PLIES. THE SEVERAL STEPS MAY BE NOTED FROM LEFT TO RIGHT IN THE PICTURE, COMPRISING REVERSING THE TIRE, CUTTING, AND STARTING THE PLIES BY HAND.

3. Cable power transmission: a proper ratio of speed is obtained between the pulling elements, one of which hold the end of the tire while the other serves as a wind-up for the separated fabric. The fabric, as pulled, winds in a roll on the pulling spindle from which it is easily removed. A convenient arrangement enables the operator to stop and reverse the mechanism whenever necessary, for he is obliged to pull up by hand an a pulley, as the machine is actuated by a foot treadle.

(The Loewenthal Co.)

PULLING FABRIC FROM TIRE CARCASSES. THE TREAD STOCK WINDS ON THE DRUM WHILE THE PULLED FABRIC WINDS ON THE SPINDLE, EACH IN OPPOSITE DIRECTIONS. THE PRODUCTS MAY BE NOTED ON THE FLOOR AND IN THE BASKETS.

and is speedy in operation. With such a machine a skillful workman can strip 25 or more tires per hour, producing practically 1,000 pounds of pulled fabric per ten hours.

The auto treads from which all but one or two plies have been pulled are designated in the scrap rubber trade as "Auto Tread Stock" or "Dyke's Peelings." This is sorted by quality and color the same as the original tires and stored preparatory to baling for shipment to the rubber reclaimer.

Machine-made tires permit separation of single plies in continuous length from uncured tires. Wide pulled fabric is obtained by cutting away the edges of the tire beads and removing the plies full width, pulling out the bead cores as they are exposed in the process. Fabric of this sort is especially adapted to tire rebuilding purposes because of its width.

STRIPPING TIRE BEADS.

Tire beads, cut from the tires as described above, contain a core of wire or hard rubber surrounded with rubberized fabric. The latter has distinct value and is removed for rubber reclaiming purposes. Hard rubber bead cores, ground fine, are used as a filling in low-grade small molded rubber goods, mats, matting, etc.

STRIPPING BEAD FABRIC.

The bead circles from the bead trimmer are cut once preparatory to prolonged boiling in a tank of water or live steam, where the grip of the fabric on the core is loosened. The stripping could be done by machine, but ordinarily is accomplished by hand power.

A workman with pliers frees the fabric from one end, placing the exposed core or center in the grip of a pair of tongs hanging overhead, and by direct pull strips down the covering material of fabric and rubber, known as "coreless beads."

GRADES OF SALVAGED RUBBER AND FABRIC.

A descriptive list of qualities of rubber and fabric salvaged or dissected from discarded automobile tires follows:

REPAIRABLE TIRES.

STRIPPED AND ROAD-WORN TIRES.—Casings as rejected by the motorist. They are valuable chiefly for the friction rubber reclaimable.

BEADLESS TIRES.—Beaded but not stripped.

NO. 1 PEELEINGS.—Rubber stock free of fabric cut by hand from tread and side walls.

NO. 2 PEELEINGS.—Similar to No. 1 peelings, but containing breaker and some building fabric.

AUTO TREAD STOCK (DYKE'S PEELEINGS).—The fabric carcass minus beads and three or four plies of salvaged duck plies.

CORELESS BEADS.—The material stripped from the cut beads.

GROUND BEAD CORES.—This stock is no longer valued and has dropped from the market because of its low grade.

PEELINGS.—This is a by-product produced in the manufacture of new tires and inner tubes, and in the operations of tire repair men.

PULLED AUTOMOBILE FABRIC.—Single or multiple-ply as specified. This is a recent development and is extensively used in rebuilding and repairing tires, and the manufacture of tire boots or patches and reliners; also in the manufacture of a variety of small rubber articles where strong fabric is required.

Pulled tire fabric is now an important item of supply in the automobile tire accessory, tire repair and rebuilding trades. Reliners and blow-out boots made up from sound pulled fabric, properly prepared, are recognized as equal in serviceability to such articles produced from new fabric. The extensive demand existing for this merchandise made from salvaged fabric has induced some members of the large scrap rubber organization to specialize in this manufacture in addition to the work of salvaging.

CONCLUDING RETROSPECTION.

Salvaging fabric in scrapped goods is by no means new. Thirty years ago a mechanical goods factory stripped the fabric from scrapped hose, dipped it in cement and made it up again into garden hose which sold at a very low price.

So, too, both the English and the French have devised processes for using finished fabric either with its rubber content or without. French rubber chemists, for example, devised processes for removing the rubber in scrapped tire carcasses without injuring the fabric. One process, the De Villers, consists in treating the rubber-impregnated fabric with boiling hot tetrachlorethane in two stages, together with the intermediate use of a filter press to separate the fabric from the rubber in solution. The fabric is practically free from rubber and used in the manufacture of various small articles for which cotton duck is used.

(The Loewenthal Co.)

STRIPPING TIRE BEADS. BOILING HOT CUT BEADS FROM THE TANK AT THE LEFT. THE PULLED FABRIC IS PILED FROM THE CORES AND FORM THE PILE AT THE RIGHT.

In another process, the Dehaage, the rubber-impregnated fabric is treated three times with xylol subjected to heat and powerful agitation in vacuum to dissolve the rubber, the cloth after each treatment being placed in a washing machine with cold xylol to remove rubber particles still adhering to it, also resin and free sulphur, and is finally rinsed and dried in a current of warm inert gas.

Better Rubber Trees.

by J. P. Koenig.

Now that hundreds of thousands of acres have been planted with *Hevea* rubber and have come into bearing, the mistakes made in the beginning come to light. That mistakes were made is not surprising, considering the feverish haste in which this planting was done. The directors and investors were probably not familiar with the principles underlying agricultural enterprises and expected only as speedy returns as possible, on the money invested. At the time of the rush not enough technically trained men were available to take care of the new undertakings, and as a result we now have to face many problems which would not have come up had the foundations been properly laid. Some of these mistakes can be remedied, others cannot, except by cutting down the whole plantation and starting anew. While in the end this might pay, stockholders and investors naturally are loath to chance it, especially as every well-managed plantation brings in a substantial dividend as it stands. But with keener competition and diseases demanding more attention, it is imperative to any company undertaking new plantings to avoid the mistakes made in the past.

Luckily the scientific side of the industry is gaining recognition and confidence by the practical planter. Yet today it is practically only the question of diseases which receives attention, while the more important point of correct planting is neglected nearly as much as it was in the beginning of the planting industry. I call this point more important because the matter of diseases does not demand attention until after the plantation has been well established, while the trees, once planted are there to stay. Now and then something has been said about breeding a better strain of *Hevea*, and seed selection has been given some consideration but no serious attempts have been made to improve the situation.

A SIGNIFICANT COMPARISON.

To make clear the faults of the present system of planting, I should like to compare a rubber plantation to an orchard. Following the same methods as those employed in planting *Hevea*, the procedure in an apple orchard would be as follows:

A number of apples would be gathered, composed of perhaps two hundred varieties, good and bad. The seeds would be taken out and the soundest ones selected and planted in a seed-bed. After a set time a number of seeds would germinate and these would be planted, discarding all the rest. In planting, the young trees would be planted, say 9 by 18 feet. When, after a number of years, the trees began to bear, they would be found to be too crowded and half would be thinned out. Selection as to the merit of the fruit would be carried out as far as possible without disturbing the planting distances too much.

How soon would a fruit farmer be in the poorhouse if he followed the above method? And why are our rubber plantations planted in exactly that way? Because they pay dividends as it is, or because it was always done that way?

RUBBER GROWING IS MORE HORTICULTURE THAN FORESTRY.

Some persons contend that a rubber plantation cannot be compared to an orchard, that it should be treated as a forest. I think that many mistakes in planting find their origin in this conception. The problems of the rubber planter are not those of the forester, but those of the horticulturist or agriculturist. In such an intensive culture as that of *Hevea* the tree must be treated as an individual and not all the trees as one collective unit. The matter of diseases is one for the mycologist to deal with; improving the race is for the physiologist or the horticulturist to consider; in short, all the problems encountered by the man who has an orchard are the same as for the rubber

planter. The fact that an orchard measures potatoes one hundred acres and a rubber plantation one thousand or ten thousand makes no difference. Unless each tree is given proper attention and made the best there is, the whole cannot be satisfactory.

Upon superficial inspection a rubber plantation looks very much like an orchard planted from seed. The size and markings of the seeds, the size and color of the leaves, the mode of branching, the appearance of the bark, etc., are some of the more obvious differences. And that this variability applies to the much more important factor of yield is known to every planter. The following figures, obtained during the course of an extended experiment, show the extent of this. Of 250 trees, the dry rubber yield of which was measured daily, the lowest yielded 16 grams while the highest gave 342 grams during the same period. These trees were taken at random, but the average for the whole lot was the same as that for the entire plantation, namely 66 grams. Now, if only trees of the type yielding 342 grams were planted in the beginning, the production of the plantation would be five times that of today. Is there any company which cannot afford to wait an extra year if necessary to make proper preparations?

I do not mean to attack the selective thinning methods advocated by progressive planters; the more systematically this is done the better. The best practice is not to plant inferior trees to begin with, so that later on selective thinning will be unnecessary. The argument that a newly formed company cannot wait any longer for rubber than is absolutely necessary is like arguing that a new factory should be erected without foundations because that will hasten production by six months.

PRINCIPLES GOVERNING STOCK SELECTION.

Then how should better planting stock be obtained? Before answering this question, I would like to point out the guiding principles which should govern the selection of stock. These principles concern:

1. Yield.
2. Disease resistance.
3. Quality of the rubber.

YIELD. Besides being dependent upon external conditions, such as physical and chemical conditions of the soil, climate, and the like, the yield is an inherent character of the tree, and any amount of cultivation cannot improve it beyond a certain maximum peculiar to the individual tree.

DISEASE RESISTANCE. While yield has been mentioned frequently in this connection, the question of disease resistance has been scarcely touched upon. It is a well-known fact that where one strain is susceptible to disease, another is not. This holds good in the plant world as well as in the animal world. Field mice, for instance, are highly susceptible to glanders, house mice are almost completely immune; Jersey cows are more liable to tuberculosis than Holsteins; and Yorkshire swine are more resistant to swine-erysipelas than some other porcine breeds. It has come to light in the experience of every physician that members of the same family, exposed at the same time to the same possibilities of infection show greatly varying susceptibilities. Many varieties of apples and pears cannot be grown because they are sure to fall prey to some disease, while other varieties are totally immune. Practically every planter has noted that certain trees are easily infected while adjacent trees are passed untouched. The reason for this phenomenon lies in the inherent immunity to disease in the individual tree.

QUALITY OF THE RUBBER. No extensive work has been done regarding the variability in the quality of the rubber derived

from individual trees. Some differences among latices are very apparent, such as color and concentration of the latex, and it is more than probable that the intrinsic value of the rubber from one tree is better than that of its neighbor. For a thorough consideration of the problem this point should be given attention, though it is of less importance than the questions regarding yield and disease resistance.

METHODS OF IMPROVING STOCK.

The methods whereby better planting stock can be produced on the basis of the three points mentioned above may now be considered.

SEED SELECTION can never result in a uniform, highly productive plantation. The selection of seeds from trees, known to be good producers enlarges the chances that the offspring will be better yielders, than when the seed is obtained from unknown parents. But the laws of heredity show that this is nothing more than a chance, due to the number of generations of interbreeding and the cross-fertilization which takes place.

The methods for improvement based upon scientific principles present themselves as follows:

1. Breeding.
2. Seedling selection.
3. Artificial propagation.

BREEDING. In order to obtain a better strain through this method, it is necessary to isolate a single strain, which will breed true to type. Through cross-fertilization during a large number of generations, the present plantation rubber tree is of a very complex nature, and to isolate such a strain in a systematic way involves a great amount of work, to be divided over a large number of years. This is the more so because three different characteristics are involved, namely: yield, disease resistance and quality of the rubber. As a tree has to be grown for at least four years to determine the single factor of yield, it will easily be understood that the problem of breeding a really valuable strain will take more than one generation of investigators.

That scientific breeding experiments should be carried out is certain, but this should be done by the various governments concerned; for any private concern this method is entirely too costly and requires too much time for any immediate commercial purposes.

SEEDLING SELECTION. There is no way to select in the nursery the seedlings which will later develop into big producers that will be immune to disease. No morphological character is known correlated to yield. As a result of extensive experiments along this line with fully grown trees I am satisfied that shape and size of leaves, mode of branching, color and texture of bark and similar characteristics are not correlated to yield. There is a possibility that histological characters, such as distribution of latex vessels, their number or size, may furnish a clue to productivity, but as we are dealing with seedlings, these would have to be destroyed or at least seriously damaged before their value was known. While of course it is best to select the most vigorous seedlings for planting out, still this is not the solution to the problem.

ARTIFICIAL PROPAGATION. This is the method used by pomologists to perpetuate the strain or variety, which has proved valuable. The varieties of apples, pears and other fruits were originally obtained through cross-breeding, a procedure, which, for immediate results, is out of the question for *Hevea*, as has been pointed out above. For stock we have to start with the trees now on the plantation. And it is a sure fact that enough material is there to produce something much more valuable than the average we have today.

PROCEDURE TO BE FOLLOWED.

In order to obtain the best stock the following procedure should be followed:

1. Select a number of the oldest trees to be found, growing

under the same conditions regarding soil and climate as those prevalent on the new plantation.

The oldest trees should be selected, because they have been under observation for a longer period than the younger ones and more is known about their yield and disease resistance. They should be chosen from a locality where soil and climatic conditions are as nearly as possible the same as those on the contemplated plantation, because a certain variety may prove excellent in one soil, while it would not be in another; it may grow well at a high altitude but break down in the lowlands. The argument sometimes put forward that selecting seed from a place where conditions are entirely different from those on the new plantation will result in better trees, is entirely without any scientific foundation.

2. Of the trees selected, choose those which show no evidence of ever having been attacked by disease.

The chance for immunity to disease is greater in such trees. This of course does not mean that these trees will never contract any disease; it simply improves the chances for a disease-proof offspring.

3. Of the remainder select the highest yielders.

To determine which is the best yielder, it is necessary to measure the dry rubber yield for an extended period, preferably one year.

4. If two or more trees yield about the same quantity, the choice should fall on the tree producing the best quality of rubber.

This point is of less importance than yield and disease resistance, unless very great differences should be found in the course of the experiment.

METHODS OF ARTIFICIAL PROPAGATION.

These may be divided into two groups, those providing for their own root systems and those where one tree is grafted upon another. It is probable that the root system is as important to latex production as are the parts above the ground.

Methods for developing root systems include marcotting and cutting. The first method, marcotting ("tjankok"), has been successfully carried out in the experimental garden at Buitenzorg, Java. It is a laborious method, however, and should be used only if every other method fails.

Cuttings were made from the first seedlings grown at Kew Gardens and shipped to Ceylon, and it can be done again. These cuttings carry with them the characteristic root system of the parent tree. This root system is a suitable one for a good producer inasmuch as the parent tree was selected for its productivity. It is barely possible that a less perfect root system will develop from cuttings and this should be investigated. If, however, cuttings develop a good root system, this method is to be preferred above any other method of artificial propagation. It is speedy and above all simpler than grafting, and can be carried out by native labor with a minimum amount of failures.

Methods whereby a good-producing, disease-resistant variety is grafted upon another root system are numerous. One of the simplest has been carried out on a larger scale lately on one of the Sumatra plantations and has proved quite successful. This method is budding. However, when resorting to grafting the thing to bear in mind is, that not only should all possible attention be given to the derivation of the bud or scion, but the stock used to graft upon should be carefully selected. Other qualifications enter into the selection of this stock than into the selection of the bud or scion. The most important is to select young trees free from any root diseases and those with the best-developed root systems. The stock can very well be grown from seed, but none except those having the above-named qualifications should be used to graft upon.

Summarizing the foregoing paper, it is found that:

1. The present method of reproducing *Hevea* should be discontinued.

the cemented pieces would not stick to the cloth, and much material formerly scrapped because of this was saved. Along the same line it was learned that gum shoe linings became easily crushed and wrinkled when put in cloth boots for team makers. Consequently a scheme was devised whereby they

No. _____ Dep't. _____
Date Collected _____
Kind of Scrap _____
O. K. _____
Weight _____ Lbs.

The foreman of each department is furnished with a weekly report showing the totals of the daily collections and the percentage for his department. In addition a chart is posted in

Weekly Scrap Report

were cemented on tins, placed in a car with grooves about 3-inches apart to fit the trays, and slid in a similar compartment under the maker's bench, thus keeping them fresh and in first class condition to be made up the next day. In the cutting room it was discovered that the angle for cutting strips on the bias varied slightly on the drum where the stock was laid off, from the angle on the cutter's block, thus causing scrap ends. This was remedied and more material saved.

After the scrap is collected it is taken to a shed or portable building in the yard reserved for the purpose, where it is examined, baled up when necessary to sell it, and ground up to be used in various ways. Here the scrap man has another function in determining what scrap can still further be used as good material. Occasionally good stock, either intentionally or otherwise, finds its way into the scrap. This must all be returned to the department from which it came, and if there is any evidence to show that the act was deliberate, it must be reported to the superintendent.

While all small parts used in boots, gaiters, and gum shoes, such as facings, toe tips, heel pieces, stays, etc., are cut out of board scrap or cutting ends, the scrap man can very often contribute additional ways of using material. For example, a gum shoe of new construction called for a cork heel lift; enough ends or scrap from cutting soles of the same material were accordingly brought in from the scrap department and used to cut the entire ticket. Again, the tube department was having a special stock run to cut a small circular reinforcing strip for the air valves when it was discovered that side and end pieces of friction scrap from the shoe factory could be used for this purpose. In the tire department much of the fabric trimmings are used in making beads. Sometimes large sizes of tennis tops, insoles, or shoe linings can be cut down into smaller ones where the defect is slight.

Judgment must be exercised, however, as very often the labor cost of cutting down this material is greater than the value saved.

Thus the scrap man must have accurate and complete information on material and labor costs; must understand rubber goods manufacturing from A to Z, and must maintain constant touch with the superintendent and foremen.

With the proper facilities for grinding, any rubber shoe factory can find use for 85 per cent of its waste by converting it into the product. One concern which formerly baled up cloth scrap, especially that with a low percentage of rubber, and found difficulty in locating a market for it, solved the problem by installing in the scrap department a rotary cutter such as that

each department showing the rise or fall of waste. These charts serve to stimulate an interest in keeping the departmental totals as low as possible and induce a note of competition between departments for the best showing.

Frequently the scrap man devises minor changes in the arrangement of departments or the routing of material in consultation with the superintendent and foremen that will reduce the scrap. For instance, it was found that by using oil or fish-cloth leaves in books for conveying work to the makers

shown on page 288 of "Rubber Machinery" by Henry C. Pearson. All linings and nets, friction stocks and cloth coated on both sides were ground up and used in a fibrous compound as a covering for inside work known as "rag." Screens of various mesh were used from $\frac{1}{2}$ to 3/16-inch. It was found to produce a much more uniform "rag" than the old method of running the scrap over the cracker directly, and made it possible to use up many more kinds of scrap.

Cloth used for tennis tops, which formerly had a poor sale baled up as scrap, especially the doubled or "stuck upper" which could not be sold at all, was all ground up to make fiber for fiber soles and heels. Bad heels were pulverized to be used over again in the cheaper grades. In fact, the only scrap to be sold under the new arrangement is cut shoes, tires, cured trimmings, and tube wrappings. Constant touch is maintained with the chemical laboratory which has been of valuable assistance in working out compounds to make use of scrap.

In brief, this is the system devised for handling the scrap problem in one rubber factory. That it has been successful is shown by a 2 per cent decrease in scrap which has been maintained for several months, and further reductions are looked upon not as a possibility but as a certainty.

GOVERNMENT SPECIFICATIONS FOR BALLOON FABRIC.

AS the following specifications are subject to revision, manufacturers are advised to apply to the War Department, Air Service Engineering Division, Dayton, Ohio, for the latest rulings.

SPECIFICATION No. 16,013-A, MARCH 25, 1919,
SUPERSEDES SPECIFICATION No. 16,013.

GENERAL.

1. This specification covers the requirements of the Bureau of Aircraft Production for balloon fabric for use in the manufacture of balloons.
2. Balloon fabric is rubberized balloon cloth.
3. Specifications Nos. 16,022-A and 16,023-B state the requirements and tests for balloon cloth and should accompany this specification to all manufacturers of balloon fabric.

USE.

4. Balloon fabrics of the various grades and numbers, as listed in Table 2, are intended for use in the construction of balloon parts as follows:

Type.	Part.	Fabric Number.
Kite balloon	Envelope	1 or 2
	Balloonet	3, 4, 5 or 6
	Lobes	8
	Type	11 or 12
Dirigible balloon	Envelope	1, 2, 9 or 10
	Balloonet	3, 4, 5, 6, or 7
	Type	11 or 12

5. "Parallel" doubled fabric may be designated in an order by adding the letter "S" to the number of the fabric.

MATERIAL.

6. Balloon fabric shall be manufactured from finished balloon cloth conforming in every respect to Specification No. 16,023-B.
7. The rubber coating used in balloon fabric construction shall contain the best quality rubber and the highest grade ingredients designed to give minimum permeability and the best weather-resisting qualities.

MANUFACTURE.

8. Workmanship shall be consistent with the best manufacturing practice.
9. Balloon fabric must not be overcured or undercured nor show excessive water-marks. The existence of any of these conditions will be

cause for rejection and will be determined by the Chief of Balloon Inspection.

10. Twoply bias fabric shall be made up with the bias ply on the outside unless otherwise specified in the order. The bias ply shall be set at an angle of approximately 45 degrees to the straight ply.

SELECTION OF TEST SPECIMENS.

11. SAMPLES. A sample for tests shall be taken from every roll of fabric.
12. Additional samples to determine the uniformity of the fabric may be taken from any portion of the roll, as may be deemed necessary by the inspector.
13. Each sample taken from a roll shall be at least 6 1/2 yds. long and the full width of the roll.
14. SPECIMENS. Tensile test specimens, each 10 inches long and two (2) inches wide, shall be cut from each sample, parallel to the system of threads to be tested.

FIG. 1.

FIG. 2.

METHODS OF CUTTING TEST SPECIMENS.

15. Three specimens of single-ply fabric or twoply parallel fabric shall be cut parallel to the warp, and three specimens shall be cut parallel to the filling, as shown in Figure 1.

16. The test specimens of single bias fabric shall be cut parallel to each system of threads under test as indicated by the arrows in Figure 2; three specimens being cut parallel to the warp of the straight ply, three parallel to the filling of the straight ply, three parallel to the warp of the bias ply, and three parallel to the filling of the bias ply.

TESTS.

17. TENSILE STRENGTH TEST. The tensile test specimens, prepared in accordance with the foregoing instructions, shall be tested under existing humidity conditions.

18. The test specimens shall be tested in tension in a machine of the inclination balance type having a maximum capacity of 400 pounds.

19. The jaws of the testing machine shall be 2 1/16 inches wide and shall be three inches apart at the beginning of the test. The jaws shall separate at the rate of approximately 30 inches per minute.

20. The average breaking load of the three specimens cut in each direction shall be taken as the tensile strength of the sample which they represent. The tensile strength of the balloon fabric must be not less than that shown in Table 2.

21. PERMEABILITY. The permeability of the fabric to hydrogen shall be determined under the following conditions, by a method and apparatus approved by the Inspection Department of the Bureau of Aircraft Production. The fabric shall remain in contact with an atmosphere of pure

hydrogen in the testing apparatus for at least one hour before beginning the test, this time being in addition to that necessary to replace the air in the permeability cell with hydrogen. The fabric shall be maintained during the test at a temperature of at least 72 degrees F. (23 degrees C.). A current of pure hydrogen shall be maintained against one side of the fabric for a test period of at least two hours. The hydrogen current shall be under a pressure of at least 1.18 inches (30 mm.) of water above the pressure on the air side of the fabric. Dry air at approximately atmospheric pressure shall be passed over the air side of the fabric. The quantity of hydrogen that passes through the fabric shall be determined either by burning to water and weighing as such, or by any other accurate method such as that using the gas interferometer. The permeability shall be calculated in liters of dry hydrogen measured at 32 degrees F. (0.4 degree C.) and at 29.92 inches (760 mm.) mercury pressure. The permeability shall be expressed in liters per square meter per 24 hours.

22. The permeability of the fabric must not exceed the maximum permeability shown in Table 2.

23. WEIGHT. The weight of the fabric shall be determined under existing humidity conditions by weighing three representative test pieces, cut out of the sample with a die, each having an area of at least 4 square inches. Weights shall be expressed in ounces per square yard.

24. The average weight per square yard of at least three test pieces must not be more than the maximum nor less than the minimum limits given in Table 2.

25. LIGHT TEST. The fabric shall be run over a bank of lights and carefully examined for imperfections of manufacture, such as pinholes, uneven spreading, imperfect doubling, wrinkles and other defects.

26. Weak or imperfect parts of the fabric which have been marked on the cloth before rubbering, or which have been discovered in the finished fabric, shall be distinctly marked on the finished balloon fabric. Sections of cloth so marked shall be excluded or patched in cutting panels for United States Army balloons.

MARKING.

27. Finished balloon fabric shall be stamped or marked, at intervals of two feet, with the official acceptance stamp of the Bureau of Aircraft Production.

28. All rolls of balloon fabric shall be plainly tagged with the grade, the manufacturer's name or trade-mark, the date of manufacture and the Bureau of Aircraft Production order number.

INSPECTION.

29. All balloon fabric shall be subject to inspection by the Inspection Department of the Bureau of Aircraft Production under its Manual of Inspection.

30. The inspector shall at all times have free access to all parts of the factory which concern the manufacture of balloon fabric ordered to this specification, and shall be at liberty to satisfy himself that the fabric is in accordance with this specification.

31. Fabric rejected on account of uneven spreading, pinholes or other imperfections may be used as designated by the Chief of Balloon Inspection.

JUDICIAL DECISIONS.

A. SCHRAMER'S SON vs. PROTEX MANUFACTURING CO.—District Court, Eastern Division of Northern District of Ohio, November 19, 1918.

Suit to prevent the infringement of Twichell patent No. 927,298 for a gage for testing the pressure in automobile tires. Injunction granted. (Federal Reporter, Volume 254, page 438.)

A. G. SPALDING & BROTHERS, vs. JOHN WANAMAKER, vs. SAMUEL BUCKLEY & Co. of London and New York.—Circuit Court of Appeals, Second Circuit, February 13, 1919.

The suit was brought for infringement of patent No. 878,254 for a golf ball pitted with circular cavities. The sides of the cavities are very steep, at an angle of 145 degrees at the periphery. The Wanamaker ball had similar circular cavities between sides made at an angle of only 35 degrees with the surface. The court held that these would not accomplish what was claimed for the Spalding ball, that the inclination of the sides was an essential part of the patent and that, therefore, there had been no infringement. Injunction denied. (Federal Reporter, Volume 256, page 536.)

MILLER RUBBER CO. vs. DELASKI AND THROPP CIRCULAR WOVEN TIRE CO.—Circuit Court of Appeals, Sixth Circuit, May 6, 1919.

The DeLaski company brought suit for infringement of their patent, (No. 1,011,430), for a tire-wrapping machine. This patent had been declared valid in the Circuit Court of Appeals for the Third Circuit in the suit of the DeLaski company against W. R. Throop and Sons. Subsequently the DeLaski company acquired the W. R. Throop business.

The Miller company bought a tire-wrapping machine from De Laski and one from W. R. Throop; then it had two more machines built, which DeLaski asserted were made according to his patent; he sued in behalf of the W. R. Throop interests also.

The court held that the question of infringement depended on

whether the pressure head or its equivalent of the DeLaski patent had been used, and decided against the Miller company, declaring that the infringement was "purposeful and inexcusable" and that there was just apprehension that it would be persisted in. (Federal Reporter, Volume 257, page 733.)

DECISIONS OF COMMISSIONER OF PATENTS.

IN RE LINK-BELT COMPANY.—Court of Appeals of the District of Columbia, June 2, 1919.

Court held that the Commissioner of Patents was right in refusing to register as a trade mark for rubber and fabric belts the word "Service" surmounting a bar with V-shaped ends. The word "Service" in this instance would be descriptive of the goods. "It has a fixed meaning in trade generally as indicating that goods so described are serviceable, and will notably wear well, but are especially adapted to meet the requirements of the user of the goods to which the mark is applied." Decision affirmed. ("Official Gazette," August 26, 1919.)

TREASURY DECISIONS.

No. 43314.—Protest 931413 of The Rubber Association of America, Inc. (Seattle).

GUTTA SIAK.—Gutta siak, classified at 10 per cent ad valorem under paragraph 385, Tariff Act of 1913, is claimed free of duty under paragraph 502.

Opinion by HAY, G. A. Gutta siak was held entitled to free entry as gutta-percha under paragraph 502. G. A. 8194 (T. D. 37759) followed.

INTERESTING LETTERS FROM OUR READERS.

AN OPPORTUNITY FOR EUROPEAN TRADE.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR:—I am writing to you with the object of calling your attention to the firm of Ing. Leone R. Talvy, via Vivaio 21, Milan, a member of this chamber, who is desirous of getting in touch with American manufacturers who may be looking forward to extending their business to European countries. Mr. Talvy is favorably quoted here and is in a position not only to cover Italy, but also Serbia, Roumania, Bulgaria, and European Turkey, being acquainted with the markets in said countries, and having branch offices in Belgrade, Serbia.

The articles in which he is more particularly interested are: tubes, sheets, gloves, cushions, ice-bags, etc., and I shall greatly appreciate your kindness, if you will supply Mr. Talvy's address to all such manufacturers whom you may happen to know, who are anxious to secure valuable connections abroad.

This Chamber desires to thank you in advance for the favor and if at any time it can reciprocate the courtesy, it will certainly be glad to do so,

Very truly yours,

Secretary, American Chamber of Commerce of Italy,
Via Bocchetto 3, Milan, Italy.

FOLDING FILTER PAPERS

An improved method for folding filter papers for rapid filtration follows:

FOLDED FILTER PAPER.

Instead of tearing off a corner of the filter paper tear a strip back as far as the fold at B, and fold over on to the other side.

This affords a double thickness nearly all around the top of paper, making it less possible for any fine precipitate to crawl over the top of paper, also preventing any air from escaping down along the side of the aper. ("The Chemist-Analyst.")

THE RUBBER TIRE SUPPLY CO., INC., 420 EAST ST. LOUIS street, Springfield, Missouri, has increased its capital stock from \$10,000 to \$20,000.

Eyelets and Grommets in Rubber Goods.

AMONG THE LITTLE THINGS which are used by the million in rubber factories are eyelets and their big brothers, grommets. They are used on various lines of goods, wherever a hole in the material needs strengthening so that strain upon it will not tear through. They sell at \$100 to \$1,500 per million, according to size, kind, quality, and finish.

MANY DIFFERENT VARIETIES.

There are many varieties. The ordinary eyelet is of brass, in one piece, much the shape of a miniature hat without a crown. It consists of a rim and a "barrel," the latter being tubular and of varying length, according to the thickness of material on which it is used. The whole may be of plain brass or may be japanned, or the rim only may be enamelled or covered with a coating of celluloid. The brass eyelet may be finished in silver, tin, copper or nickel. The enamelled and celluloid-covered eyelets are made in a large variety of colors.

While most of these eyelets are circular, there are oval ones and long narrow ones to accommodate wide flat laces. There are also some made with scalloped or corrugated rims for ornamental purposes. These eyelets are made entirely by automatic machinery which stamps the disks out of sheet metal and draws each piece into the shape desired.

THE STIMPSON EYELET-
TING MACHINE.

GROMMETS ARE LARGE EYELETS.

Eyelets are made in a great variety of sizes, from the little one only large enough to allow passage of the smallest twine, to those measuring one and one-half inches in diameter. The larger ones are called grommets, though in some trades this name is given to an eyelet of large size which is backed either by a metal washer, or another eyelet just enough smaller in the barrel to fit inside the larger, the two being inserted on opposite sides of the fabric, and pressed firmly together, spreading the ductile barrels, and thus showing rims alike on both sides.

The under side of the common eyelet, when in place, shows the barrel split into six or eight sections which radiate evenly from the center. This effect is accomplished in two ways. If the barrel is scored the "set" of the machine breaks it at the scored lines. If the barrel is not scored, a corrugated "set" is used in the machine, which cuts the barrel into these sections, and curves them, as the pressure is applied.

RUBBER TRADE LARGE USERS.

In the rubber trade, footwear manufacturers are the largest users of eyelets. Shoes which close by lacing require them—principally hunting and lumbermen's boots, booties, and other heavy duck lines. Some short rubber boots are made with an oblong "knob pull-on" in place of a pull-strap or loop, and in order that these boots may be hung up when not in use a grommet is placed above the pull-on.

But the large use is in the production of tennis shoes. The common, low-priced "sneakers" made by the million, consume eight to twenty in each shoe. These are of the low-priced

variety. To-day the tennis lines have been improved in style, in quality of material, and in workmanship, and in place of the plain brass eyelets, those of finer quality, enamelled or celluloid-covered, are used, matching in color the fabric in which they are inserted, or finished in contrasting colors.

LACING STUDS.

Besides eyelets, or in place of them, lacing studs are used in men's and boys' footwear, and to some extent upon puttees and leggings. The lacing hook is an adaptation of the eyelet and is used to facilitate fastening the shoe. It is not used extensively on women's and misses' footwear, mainly because the hooks were found to catch and tear women's skirts, and although present fashions of short skirts obviate this objection, they have not become popular on feminine footwear. The lacing stud is practically an eyelet, with an extension bent over to form a flat, button-like hook which obviates the necessity of inserting the lacing through an eyelet.

MACHINES FOR SETTING EYELETS.

There are various machines made for "setting" eyelets and studs. The small hand tool, much like a leather-punch, is the simplest. Next, there are adaptations of the same mechanism, by which the eyelet is set by pressure of the foot on a treadle. Then come machines which punch the holes, insert the eyelets, and carry forward the work the proper distance for the next eyelet. These machines are quite complicated. The eyelets or studs are poured into a hopper in which is a revolving brush, which places them right side up in a raceway whence they are

DUPLEX EYELETING MACHINE.

fed to the proper point for insertion. These machines have a capacity limited only by the ability of the operator, some men being able to eyelet 4,000 pairs of shoes per day.

DUPLEX MACHINES.

There are machines which set two eyelets at once, on opposite sides of the lace space, thus insuring exact matching to

each other. Other machines set in "gangs," inserting at one pressure several eyelets in a row in the lace-stay, and this row may be either straight, or curved to conform to the shape of the lace-stay.

One adaptation of the machine is for producing the "blind eyelet" effect which is in vogue in the best grades of leather

EYELETTING TENNIS SHOES.

footwear. The machine punches the holes through the several thicknesses, but sets the eyelets through all except the outside ply, thus giving strength to withstand the strain, yet showing no eyelet when the boot is laced.

Another, and necessarily more complicated machine is used for inserting grommets, or eyelets with washers. For these, two hoppers and their accompanying raceways are required, one for each member of the duplex eyelet, together with mechanism for delivering the opposing members, one above and the other below the fabric or material through which it is to be inserted.

EYELETS AND GROMMETS IN RUBBER CLOTHING.

Rubber clothing manufacturers use many eyelets in garments, these being inserted liberally in spaces under the arms to allow ventilation. For a similar purpose, they are also inserted in hats and caps and especially cape-caps and havelocks. There are eyelets or grommets in ponchos, and millions were used in these during the early years of the great war. There is still a demand for ponchos from the Far West, and for export. Rubber blankets are provided with grommets. They are also used in bath curtains. Manufacturers of reducing belts of sheet rubber or rubberized fabrics consume thousands of eyelets. Household aprons are provided with eyelets, as are also aprons used by workmen and workwomen in certain trades. Fountain syringes and hot water bottles have large grommets in the tabs by which they are suspended.

GROMMETS IN AUTO TOPS AND CURTAINS.

Grommets are largely used in automobile tops and curtains. Some of these are specially shaped for the purpose of fitting over button fasteners, either plain or turn-buttons. One adaptation is a patented fastener containing springs which grasp the button firmly, which can be unfastened only by pulling in a certain direction, indicated by a dot on the upper member of the eyelet-like fastener. These fasteners are also coming into use on luggage, cases for sporting goods and musical instruments, and other articles of leather and its substitutes. Special tools and machines are made for inserting them.

These are some of the uses for metallic reinforcements of perforations in rubber and rubberized material manufactures.

NEW PRICES FOR TENNIS SHOES.

FOLLOWING THEIR CUSTOM of many years' standing, but from which they departed last year, the various rubber manufacturers which include tennis shoes in their list of products sent out new and revised price-lists early in September. As in former years, the United States Rubber Co. took the lead, arranging its mail so that its customers in all parts of the country received the new price-lists simultaneously on the first day of the month. Then soon followed those of the Apsey, Beacon Falls, Converse, Hood and other rubber companies.

As expected, prices for the coming season are higher than those of a year ago, as those were higher than the previous year. Many lines show an advance of 10 per cent, while a goodly number have advanced 15 per cent, and a few, a still higher percentage. However, taken all in all, the trade is to be congratulated that the advance is so moderate, when it is considered that cotton duck and other textiles cost more than double the prices of a year ago, and labor has very materially increased. One material only has declined, crude rubber, but all compounding materials have advanced enough so that it is hardly likely the rubber soles of these shoes can cost any less than a year ago.

The common every-day "sneaker" probably shows as high a percentage of increase in price as any except some of the finest quality shoes. In the larger sizes these show a uniform advance of 15 cents per pair and the smaller 10 cents per pair. Men's Bals which sold in 1917 at 68 cents a pair, net, were marked up to 85 cents in 1918, and are now priced at \$1, while the youth's Oxfords, 60 cents in 1917, were 65 cents last year and 75 cents in the present catalog, while children's Oxfords were respectively 45 cents, 55 cents and 70 cents in the three price-lists.

In the medium quality goods, such as the "Campfire" line of the United States Rubber Co., the "Nantasket" of the Apsey Rubber Co., the "Yale" of the Converse Rubber Co., and the "Lakeside" of the Hood Rubber Co., the prices have advanced 15 or 20 cents; men's Bals from \$1.35 to \$1.50 and men's Oxfords from \$1.20 to \$1.40, while boys' and misses' sizes which were \$1.10 are now \$1.25 and other sizes proportionately.

In the high-priced goods, having rubber heels and soles with narrow foxing, prices show a proportionate advance. Men's Bals which were quoted at \$2.15 last year are now \$2.50, and Oxfords which were \$2 are now \$2.35. The lines in imitation welt have advanced 35 cents per pair, men's Oxfords from \$2.40 to \$2.75 and women's from \$2 to \$2.35.

The companies are vying with each other in producing handsome lines of welt construction, on lasts closely following those used by the up-to-date manufacturers of leather shoes. Each company has its own way of bottoming these shoes in welt construction, lasted by experienced shoemakers, the women's lines with Louis or military heels and the toes following the narrow graceful lines which are now so popular. These boots run as high as \$4 a pair, and pumps at \$3, while men's Bals of similar make and quality are priced at \$3.75 and Oxfords at \$3.25.

Several companies are now producing lines of workmen's shoes, made to take the place of leather shoes for rough wear. The tremendous advance in the latter favors the exploitation of such footwear, which is made with brown or black duck uppers and rubber or fiber soles. As these cost, net, around \$2.25 to \$2.75, while leather upper and leather-soled shoes of similar style and wearing quality range from \$3.50 to \$5 per pair, wholesale, there is no doubt that the already large demand for these workmen's shoes, made in rubber shoe factories, will have a heavily increased sale the coming season.

COPY OF INDEX to "Rubber Machinery" will be sent free upon request.

Rubber Tariffs of South America.

EXPORTS of manufactured rubber goods from the United States to South American countries, were \$5,205,962 for 1918, and, while they no longer show the phenomenal annual increases of the last four years, have at least held their own with \$5,522,453, the figures of the record year 1917-1918. The data of comparison have been changed, for the official figures are now for the calendar year, whereas from 1907 to 1918 they were for the fiscal year. The record for this first calendar year, 1918, therefore, includes the figures for the months

Argentina with \$1,429,947 worth is our best customer for automobile tires, with Chile a good second with \$951,102, followed by Brazil \$389,822, Uruguay \$213,290, Peru \$205,887 and Venezuela \$136,881. Chile buys most belting, hose and packing, to the value of \$389,694, Brazil comes next with \$197,360, Argentina third with \$163,077 and Peru fourth with \$82,348. The A B C countries are also the best customers for boots and shoes, druggists' supplies and other manufacturers.

The order in total purchases of rubber goods is: Argentina

Calendar year 1918.
Including shoes.

from January to June, which are also used in the record for the fiscal year 1917-18, of which these months constitute the second half.

The exports, which had been steadily increasing for ten years and had about trebled in that time, took a great jump in 1914-15, the second year of the war, rising from nearly \$800,000 to over \$2,400,000; the following year added \$2,000,000 more and the year after another million. The increase exports were almost wholly of tires and of belting, hose and packing. The former, amounting to \$62,800 in 1910-11 had risen to \$264,465, in 1914-15; this became \$1,344,314 in 1915-16, \$2,819,499 in 1916-17, \$3,762,687 in 1917-18, and stands at \$3,672,606 in the calendar year, January to December, 1918.

So with belting, hose and packing which stood at a little less than the annual average in 1914-15 with \$205,223; it rose to \$402,753 in 1915-16, nearly double, to \$678,441 in 1916-17, to \$969,669 in 1917-18, again doubling the exports of two years before, and remains at \$942,488 in the calendar year 1918.

Exports of boots and shoes were irregular with a strong tendency to decline; the number of pairs, 59,149, is, with one exception, the smallest exported in a dozen years, while the value \$55,829 is also below the average. Druggists' sundries appear for the first time in the list with \$136,611 for the fiscal year 1917-18 and \$112,809 for the calendar year 1918. In both years they should be added for the purposes of comparison to "other manufactures of rubber" with which they were classified before. This will diminish the great apparent falling off in that class, by making the total for "other manufactures" \$722,708 in 1917-18 and \$619,089 in 1918.

Looking at the individual countries it will be noticed that

\$1,889,401, Chile \$1,572,766, Brazil \$735,167, Peru \$323,077, Uruguay \$266,947, Venezuela \$178,980, Colombia \$97,841; French Guiana with \$116 tails the list.

The succeeding extracts from the tariffs of the principal countries of South America are intended to show the competition to which the United States rubber manufacturers are subject under existing tariff conditions. Owing to frequent tariff changes, the figures and information given below should be periodically verified, and small trial shipments made to test the rates.

ARGENTINA.	
Equivalents	Pesos (gold), 508 cents, kilo, 2.2 pounds, g. w., gross weight.

1085.	Collars and cuffs.	8.00	30
739.	Rubber pads, for writing desks, including packing.	2.50	30

According to the law of December 1, 1911, duty-free and exempted goods shall be subject to 2 per cent of their tariff valuation.

Duty-free goods which are cleared "according to appraisement" shall be deemed liable for 1 per cent ad valorem in accordance with Article 1 of the Act dated December 31, 1905, and the net tax referred to in this article shall be reckoned on said 30 per cent.

Goods introduced for the different departments of the State, subject to the previous authority of the Ministry of Finance; goods introduced for the personal use of members of foreign legations; goods imported by railway concerns under existing contracts; material destined for the undersigned named *Luz y Fierro Cochabamba*, goods which may be expressly free under international treaties; plant for the match factory; articles for hospitals and benevolent asylums, also materials for public works imported by the municipalities; accessories imported by educational establishments.

By an ordinance of May 2, 1911, a tax of 8 per cent is levied on fine Para or Molino exported through the custom houses of Paz, Oruro, Yacuiba, Puerto Suarez, San Matias, Cobja and Aunana, as well as on bernamby, Fine Para, the lower grades of rubber and seranamy passing through the custom houses of Villa-Bella and Guayamerin are dutiable at the rate of 10 per cent.

As the valuation of this rubber depends on the fluctuations of prices in London, the tax now levied in this manner. From time to time the London prices are taken for fixing official valuation upon which the percentage is calculated, after expenses of production have been deducted.

The preceding regulations refer to footwear exceeding 20 cm. sole. From 15 to 20 cm. sole is appraised with a rebate of 50 per cent; up to 15 cm. inclusive, with a rebate of 75 per cent.

RECIPE.

Imports into Venezuela are dutiable on gross weight, i. e., inclusive of the weight of the containers. In case the containers consist of articles specified in the tariff under a higher tariff classification than that of the contents, they are assessed for duty under their own classification.

All dutiable imports are subject to the following surtaxes:

Two surtaxes of 12½ per cent of the duty each, authorized by the decree of April 25, 1901.

A surtax of 10 per cent of the duty, established by the decrees of February 16, 1903, and June 4, 1912. A surtax of 1 per cent, based on the duty increased by the other surtaxes, imposed by the decree of December 29, 1916.

PEACE PROBLEMS AND PROGRESS.

PRICE STABILIZATION APPROACHING.

Due to the continued operation of the factors which resulted in the present high prices, stabilization of prices at new levels is approaching, in the opinion of "Commerce Monthly" the magazine of the National Bank of Commerce in New York City. It is the conviction of the business world that high, or at least rising prices, are evidences of a satisfactory situation, in that they stimulate increased productive and commercial activity. Although the physical adjustment of American production to post-war demands has been more rapid than the most optimistic could have hoped, production has not yet expanded to what must be its normal post-war level.

There is now no fundamental reason to deter production, and not until it has increased to its new peace-time proportions can we rest in the assurance that as far as its effects on our economic life are concerned, the war has passed into history. Not only is production essential, but capital must be accumulated at a rate rapid enough to offset the destruction which took place during five years. The consuming public must recognize that it cannot continue indefinitely the scale of expenditure which followed as a reaction from the self-denial of war, but thrift for personal benefit is as essential as thrift for one's country. When every individual capable of gainful employment is producing to capacity and spending conservatively, our economic adjustment will be complete.

UNDER-PRODUCTION THE FIRST CAUSE OF HIGH PRICES.

In the report on the causes of the high cost of living published by the Council of National Defense, curtailment in the production of nearly all commodities except raw food products heads the list, and stimulation of production is the first remedy

suggested to improve the situation. That this is assuredly putting matters in their right order is indicated by the facts presented regarding the condition of most industries, and notably with respect to the cotton and footwear situation, both closely identified with the manufacture of rubber goods.

When the war ended the world's cotton supply was below normal and supplies of cotton goods were also low. This year's cotton acreage, however, was about 9 per cent less than for 1918; present prospects indicate a small crop, and producers are expressing gratification because of the high prices they can command in consequence. Meanwhile more spindles have been idle during the first five months of 1919 than during the corresponding period of 1918, despite adequate supplies of raw cotton for this season's requirements and the release of labor by demobilization.

Turning to footwear, it is found that the production of boots and shoes for the first quarter of 1919 was about 60 per cent below that for the last quarter of 1918, the actual difference amounting to some 75,000,000 less pairs.

Such underproduction, due to various causes, notably labor's demand for less work and more pay, has been largely responsible for the rising scale of prices. Prosperity has but one possible basis, however, and that is adequate production of necessities of life, a condition invariably assuring prices fair to all.

PAMPHLETS ON AMERICANISM.

On "Constitution Day," September 17, many large corporations distributed to their employes hundreds of thousands of copies of a leaflet entitled "The Birthday of Our Constitution," which had been prepared by the National Industrial Conference Board, of which Frederic C. Hood, of the Hood Rubber Co., is treasurer. Like the leaflet "Our Country," which proved so successful on July 4, it was issued as a lesson in practical patriotism in the belief that if our Constitution and system of government were understood and the benefits derived under them by every citizen were known, there would be a better appreciation of individual rights and duties and many radical and even revolutionary ideas would be rejected. It is likely that similar leaflets will be published for distribution on future appropriate occasions.

MISUSE OF F. O. B. QUOTATION.

The National Foreign Trade Council is calling attention to the abuse of the term "F. O. B. Port," its detrimental effect on American foreign trade, and urging that the correct interpretation of the term at home and abroad be observed by all exporters. Free on board ship was the original meaning of the term and that is the general interpretation among foreigners. It is essential to the best practice for American exporters in making an "F. O. B. Port" quotation to have it mean "F. O. B. Overseas Vessel," but if they mean anything else they should make it clear what services, such as cartage or storage, will be charged to the buyer's account.

HOMES FOR WESTINGHOUSE EMPLOYEES ON EASY TERMS.

The Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, has resumed its home-building program which was postponed during the war, and forty-eight houses are now under construction on a plot of 109 acres in Wilkins township along Ardmore Boulevard. It is estimated this tract will furnish homes for six hundred families. Sidewalks and paving will be laid, and gas, water and electricity installed. The houses will be of brick and hollow tile construction with concrete cellars and cement porches. They will be mostly of five, six and seven-room houses designed to meet the needs and the pocketbook of the man in moderate circumstances and will be sold at cost on easy terms to the employees of the company. A number of the dwellings also will be for rent.

COTTON IN SOUTH AMERICA.

AS BRAZILIAN and PERUVIAN COTTON helped to make up the deficiency during the war, it is worth while to examine the possibilities of South American cotton. In the first place cotton is indigenous to the soil of what is called Latin-America, and was not introduced by the Spaniards. It is the home of the group of fine cottons which are the best in the world. All cotton roughly comes under three heads: Indian, Upland or American, and Peruvian, which last includes Sea Island, Egyptian, Peruvian, Caravanica and others. The production of Sea Island and Egyptian is now almost wholly outside of South America, but a number of fine cottons are still raised there, mainly in Brazil and Peru.

COTTON GROWING IN BRAZIL.

In Brazil the possibilities of cotton growing are very great; already in every State along the coast from Pará to São Paulo large areas are devoted to cotton and in some cases the cultivation extends far inland. In Pará, where rubber was the main crop, cotton advanced greatly during the war, and there seems to be no limit to its possibilities. In 1910 the prophecy was made that Brazil might grow 20,000,000 bales; in 1918 she got as far as half a million, apparently. Until the 19th century England drew her supply mainly from the West Indies and South America.

Baines, in his "History of Cotton Manufacture," states that "Brazilian cotton was first imported from Maranhão in the year 1781, but was very dirty. Pernambuco cotton exceeded even that of Demarara in fineness and goodness of staple; it was much sought after, its cultivation was extended, and it brought the highest price of all cotton except Sea Island." In 1820 29,000,000 lbs. out of 151,500,000 imported into England came from Brazil. American cotton checked the expansion, but in the cotton famine of the '60s there was another spurt, and in 1871 Brazil imported 80,000 tons. Just before the war the crop was about 400,000 bales of 250 lbs. The quality of Brazilian cotton is very good, so that it is hard to understand why the cotton growing industry has not developed.

BRAZILIAN VARIETIES.

Two main varieties are grown: the perennial tree cotton known as Creoulo or Maranhão, which yields well from the second year and lives 10 or 12 years. It bears open bolls all the year round. The cotton is of very fine quality, long and silky, and may be the parent of all long staple cottons, including Sea Island. It has been free from the insect pests that have made cotton trees unpopular in other parts of the world. The other kind of cotton is the "herbaceo," the annual growth, with short white lint. The chief trouble with Brazilian cotton is that long and short staple are mixed together, and the handling of the gathered crop is very careless. Yet 1,200 lbs. of lint have been raised on one acre; while in Egypt the average is 500 lbs.

It is tantalizing to know that Brazil could produce a crop of cotton as large as the whole world turns out, or that Peru could equal the amount of the Egyptian crop, but possibilities do not mean that anyone will try to turn them into realities. The present price of cotton may act as a stimulus.

PERUVIAN COTTON.

In Peru the climatic conditions are different and resemble those of Arizona and California, where cotton is grown. There are two varieties: Smooth Peruvian, which is about 65 per cent. of the crop, has a staple not over an inch in length, but strong and of good color. Rough Peruvian, which makes up the other third of the crop, is a perennial or tree cotton, and lives as long as 20 years. The staple is from 1¼ to 1½ inches long, and can hardly be distinguished from wool. The price seems to be fixed independently of all other cottons. Besides these some Sea Is and and some Egyptian cotton is grown; the latter often com-

mands a higher price in Liverpool than real Egyptian. So far Peruvian cotton has been immune from pests. All that was raised, however, just before the war was 130,000 bales of 500 pounds. The development of the crop would call for capital to build irrigation works; but there seems to be no reason why the expenditure should not be very profitable.

COTTON IN OTHER COUNTRIES.

In Argentina the cotton possibilities are also very good; the conditions are as favorable as in Brazil, and the experiments with Egyptian cotton were successful. The chief difficulty is in obtaining sufficient labor. Little seems to have been done in Venezuela, Colombia or the Guianas, where the possibilities are also good.

THE FRENCH COTTON TEXTILE INDUSTRY.

In 1913 France imported 1,453,256 bales of raw cotton, of 500 pounds each, 1,101,953 of which came from the United States, 130,073 from Egypt and 111,780 from British India. In 1917 the imports were 1,203,930 bales. The annexation of Alsace should increase the normal imports of raw cotton by at least 300,000 bales a year.

French imports and exports of cotton yarn for four years, up to and including 1916, the last year for which official figures can be obtained, were, in metric tons, as follows: 1913, imports 4,251, exports 9,063; 1914, imports 2,499, exports 3,802; 1915, imports 37,252, exports 1,980; 1916, imports, 81,954, exports 3,457.

Before the war France produced 6 per cent. of the world's output of cotton fabrics. The production of cotton fabrics increased remarkably between 1910 and 1912—from 120,000 to 225,000 metric tons. In 1913 France manufactured 220,000 metric tons, imported 4,392 metric tons (mostly from England and Germany), and exported 50,613 metric tons, of which more than one-half went to the French colonies. The following table shows the French production, imports, exports and consumption of cotton fabrics for the four years up to and including 1916, the latest year for which accurate figures are available:

	Production.	Imports.	Exports.	Consumption.
1913Metric tons 220,000	4,392	50,613	174,780
1914133,060	4,679	26,368	111,311
191537,252	33,660	21,491	24,408
1916214,000	37,366	24,180	227,186

Owing to the abnormal conditions which are likely to prevail for the next few years at least, it is difficult to estimate the future of the French cotton-weaving industry. However, the number of French looms has been increased by 46,000 by the return of Alsace, making a total of 186,000 looms, if we figure the previous French total at 140,000, or an increase over 1913 of 33 per cent. The production of cotton fabrics, if it should increase in the same proportion, would amount to 292,000 metric tons, which, allowing for Alsatian consumption, would mean an exportable surplus of over 92,000 metric tons per year. ("Commerce Reports," July 30, 1919.)

A SEA ISLAND COTTON PROJECT.

The Mermentau Mineral Land Co., Inc., whose headquarters are at New Orleans, Louisiana, is making good progress in cultivating Sea Island cotton on its 14,000-acre tract of reclaimed land opposite Grand Chenière on the Mermentau River in that state.

The first acre was planted three years ago and nearly a thousand pounds of seed cotton were gathered. This was such a good yield that the plot was extended to ten acres, with a result as satisfactory. Last year five small farmers in the vicinity were induced to plant from this seed, with the result that they raised 28,000 pounds of excellent cotton with exceptionally long staple. This spring 250 acres were planted and a gin erected, and if the season's results warrant, the entire tract will be devoted to cotton and cattle raising.

American Chemical Society.

RUBBER DIVISION MEETING.

THE FIRST MEETING of American rubber chemists, organized as the Rubber Division of the American Chemical Society, took place at the fifty-eighth meeting of the Society at Philadelphia, September 2-6, 1919. A large and representative delegation of works chemists and others was in attendance and much interest manifested in the papers presented.

Charles L. Parsons, secretary of the American Chemical Society, in a few well-chosen remarks, congratulated the American rubber chemists on their organization as a distinct division of the Society and predicted great benefit to the cause of science and the welfare of the rubber industry when the realization becomes general that the manufacturer who secludes his processes as secrets is certain some day to awaken to the fact that he is failing to support his own interest by holding back in the interchange of ideas.

The Committee on Physical Testing, H. E. Simmons chairman, reported recommendations on tentative methods for the physical testing of vulcanized rubber goods. These included sampling, test pieces, physical tests, testing machine and computations. The tests described are for tensile strength and friction, and hydraulic and steam endurance tests on various types of hose and for belting, packing, gaskets, etc.

The report was accepted and referred to the Rubber Division for criticism and future adoption.

"A New Method for the Determination of Sulphur in Rubber Mixtures," by G. D. Kratz, A. H. Flower, and Cole Coolidge, was read by Mr. Kratz, who reviewed the methods of Esch, Spence and Young, and of Tuttle and Waters, and gave in detail the procedure of the new method, by which it is possible for one person to make 50 determinations of sulphur per week of 44 hours, together with other work. A single determination requires four hours' work.

"The Extraction of Rubber Goods" was presented by S. W. Epstein and B. L. Gonyo, of the Bureau of Standards. The solvents considered were (1) chloroform, (2) acetone (45) and carbon disulphide (55); and acetone (40) and chloroform (60), and a tabulation of results was shown indicating the relative efficiencies of the solvents following initial extraction of the vulcanized rubber sample for eight hours with acetone. The advantage of the mixed solvents was marked and somewhat in favor of the acetone-carbon disulphide mixture.

"The Theory of Balloon Fabric Protection" was briefly treated by the division chairman, Dr. John B. Tuttle. Balloons are classified in Army service as:

(1) Nurse balloons, capacity 5,000 cubic feet. These are used for transporting supplies of gas only.

(2) Kite balloons, capacity 160,000 cubic feet. They are used as captive observation balloons, requiring low visibility as targets and weather-proofing to withstand at least sixty days' exposure.

(3) Dirigible balloons, capacity 165,000 cubic feet, requiring practically the same protection as kite balloons.

Specifications of weights and constructions were given for fabrics for each sort of balloon named, including dyed plies and outside aluminum coating for protection against the heat and actinic rays of the sun.

A paper by Mr. W. W. Evans on "Balloon Seam Construction and Cements" embodied the results of experimental studies at the B. F. Goodrich plant. The temperature of the inside of a balloon is from 20 to 25 degrees F. higher than that of the outside air. This temperature can be lowered about five degrees by an outside coating of aluminum. A stock cement was used, consisting of specially washed Pará dissolved in 50 per cent

by weight of benzol. A series of working cements prepared from this, using various rubber and resin ingredients, was investigated. A certain proportion of resin was proved advantageous, also cold vulcanization at the time of making the seam. Seams are cemented and lapped three-quarters of an inch, wiped with a solution of one-half per cent solution in a mixture of equal parts of carbon tetrachloride and benzol, and rolled in contact. The seams are reinforced by the application of cemented strips 1-1/2 inches wide on the outer balloon surface and two inches wide on the inside.

Discussion of Dr. Tuttle's and Mr. Evans' papers developed that on account of the shortage of rubber during the war the Germans were compelled to use cellulose acetate and dyed fabrics in balloon construction. In point of efficiency American practice in the balloon fabrics and rubber construction was equal to that of any other nation.

The expansion of rubber compounds during vulcanization has been studied experimentally by C. W. Sanderson. A volume of one cubic inch was placed in a cylindrical cavity. Temperature increase of five degrees F. per 20 minutes was applied by means of a surrounding steam atmosphere. The rubber was free to expand upward only against the force of a graduated spring and this motion communicated to a recording device modified from a steam engine indicator. Springs of 10, 50, and 100 pounds strength were used. The ten-pound spring was not sufficiently strong to prevent porosity in the sample. The results showed that the higher the quality of the rubber compound the higher was the coefficient of expansion. After the first 15 minutes of heating, the recorded curve of expansion became a straight horizontal line. Fine Pará shows a slower expansion than brown crêpe. Milling increases the rate of expansion and over-milling will deteriorate fine Pará in this respect to the expansion rate of brown crêpe. The increase of specific gravity in cured over uncured rubber compositions is due to elimination of contained air. The contraction of a rubber compound after cure is greater than its expansion during cure.

A paper on "The Volume Increase of Compounded Rubber Under Strain," by H. F. Schippel, was particularly interesting and illustrated by a simple and striking experiment. The theory was advanced that under strain the rubber in a cured rubber mixing is drawn away from each particle of mineral matter, forming vacua on opposite sides of the particle. This condition results in a distinct increase in volume varying with the elongation and is made evident experimentally by an apparent decrease of specific gravity.

The experiment used in illustration was as follows: a cured high-grade compounded ring, suitably proportioned as to diameter and weight was stretched over a short cylinder of paraffine and a light elastic band snapped over both. This combination was seen to float in a tall glass vessel of water. That the floating effect was due entirely to the presence of vacua formed by stretching the ring over the paraffine plug was demonstrated by removing the ring from its strained position and holding it in place on top of the paraffin, retaining it there by means of the same elastic band. When placed in water the combination slowly sank to the bottom of the vessel, due to the lessened volume of the unstrained ring by the elimination of the vacua.

J. H. Scott led a symposium on "The Action of Accelerators During Vulcanization." His paper was a comprehensive review of the work of Dr. Spence and himself on the effect of sodium hydroxide, soda-lime and piperidine. The ideal catalyst is one the minimum quantity of which will give the maximum stimula-

tion to the reaction combining sulphur with rubber. Nitrogenous compounds are the most active catalysts.

The paper of G. D. Kratz, A. H. Flower and Cole Coolidge on "The Action of Certain Organic Accelerators in the Vulcanization of Rubber" treated on substances all of which have been discarded in their practice for various reasons. The accelerating effect was determined in percentage proportion for each catalyst treated referred to that of aniline as standard. Anhydrous formiline was rated at 75 and of para-phenylene-diamine at 17. Accelerators should be used in proportions based on their molecular weights.

C. W. Bedford and Winfield Scott on "Reactions of Accelerators During Vulcanization" illustrated these reactions by graphical formulae. The opinion was expressed that thiocarbonyl is the most widely used accelerator in American practice today. The presence of zinc oxide has a very marked influence in aiding the action of thiocarbonyl. The effect of this accelerator is not due to its splitting off aniline.

D. F. Cranor spoke on "The Effect of Organic Accelerators on the Vulcanization Coefficient" with special reference to hexamethyl-tetramine and thiocarbonyl, using mixings of smoked sheets 100; sulphur 6; zinc oxide 1, and one-half of one per cent of hexamethyl-tetramine and thiocarbonyl. Brown crepe will not cure satisfactorily without the use of accelerators. The presence of zinc oxide is found desirable to activate the accelerators.

The discussion on the above papers on accelerators was very brief, Dr. L. E. Weber asked if the action of the catalyzer on the vulcanization of rubber with sulphur is considered as apart from the polymerizing effect taking place in the rubber. To this, J. H. Scott replied that a catalyst may take part in both vulcanization and polymerization, but does not necessarily polymerize the rubber.

G. D. Kratz in answer to a question explained that his views were in substantial agreement with those of Ostromislensky on vulcanization.

The essentials of a procedure for the determination of cellulose in rubber goods was considered by S. W. Epstein and R. L. Moore and details of a proposed method given. This method is conducted in three stages: (1) digestion for four hours in cresol, (2) treatment with hot ten per cent solution of hydrochloric acid, (3) acetylation of the cellulose. The loss of weight due to acetylation represents cellulose.

Reviewing and summarizing the investigations of Eaton, Grantham and Day; H. P. Stevens; and Philip Schidrowitz, Dr. J. B. Tuttle in his paper on "The Variability of Crude Rubber" stated that this variability is measured by the differences in effect of the accelerating substances natural to the latex or formed in the crude rubber during preparation and the retarding agencies introduced, as for example by smoking. Such variations in curing quality are overcome in practice by the use of two to four per cent of litharge or one-half to one per cent of ordinary organic accelerators, such as aniline or hexamethylene-tetramine. The work of Eaton shows the variation the natural accelerators present and not the variation of the rubber itself.

Dr. Tuttle expressed the view that tensile strength compared to rate of cure determines the value of a rubber in practical use. For example, a slow-curing rubber with low tensile strength can be rendered satisfactory for use by the addition of an accelerator which will increase its speed of vulcanization and raise its tensile to that of a rubber naturally possessing these qualities.

D. C. Cranor advocated the use of the load required to produce a standard elongation as the determining factor in practical evaluation of crude rubber under manufacturing conditions. Mr. Postmonier suggested that the executive committee of the Rubber Division take under consideration and later report practical methods of testing the variability of crude rubber

under conditions prevalent in the manufacture of rubber goods.

J. P. Gurney, in considering "Some Methods of Testing the Hardness of Vulcanized Rubber," compared the durometer of Shore; the plastometer of Pusey and Jones; the resiliometer of Widney; and the densimeter of the Boston Belting Co. Hardness of rubber was defined as the force required to displace a unit volume of rubber and may be expressed by the formula:

$$H = \frac{M}{L \cdot T^2}$$

H, indicates hardness; M, mass; L, the load applied, and T, duration of time of load application.

"The Manufacture and Use of Crimson Antimony" was briefly treated by J. M. Bierer, who reported that the most practical method found after extended study was by the formation of antimony chloride by direct action of chlorine on the metal and subsequent conversion of the product into antimony tri-sulphide.

"Carbon Black—Its Properties and Uses," by G. St. J. Perrott, read before the Division of Industrial Chemists and Chemical Engineers, was by request of Dr. Tuttle read again before the Rubber Division. General description of the manufacturing process and machinery employed was given and illustrated by lantern slides. Carbon black has many industrial uses, the chief of which is the manufacture of printing inks and rubber goods, 10,000,000 pounds annually being used in printing ink and 20,000,000 pounds annually in rubber goods, chiefly in tires. The form of apparatus used in the condensation of the black from the burning gas produces either "short" or "long" black, so called because of the short battery consistency of the preparation of oil and black in printer's ink or the opposite tendency of the mixture to draw out when separated between the thumb and finger. By microscopic examination the difference is seen to be due to a tendency in the case of "long" black for the particles of the pigment to agglomerate. The diameter of carbon black particles varies from 75 to 100 millimicrons.

A short descriptive paper, "Research on Zinc Products for the Rubber Industry," was presented by P. R. Croll and I. R. Ruby.

Owing to the length of the program of papers and for other reasons the following were omitted or read by title: C. Olin North, "The Effect of Compounding Ingredients on the Physical Properties of Rubber." (Omitted.) "Symposium on the Testing of Pigments." (Omitted.) C. P. Fox, "Laboratory Aprons." (Omitted.) H. E. Simmons, "The Value of a Library to the Rubber Laboratory." (By title.)

All papers read at the meeting are subject to the rules of the American Chemical Society and will not be published until released by that body.

The report of the Fruit-Jar Committee was filed. The efforts of manufacturers and leading jobbers to educate jar-ring users was endorsed and dependence on their guaranties advised. The committee endorsed the recommendations of the United States Bureau of Agriculture, States Relation Section, on jar rings, with tests, adapted for use at the counter and in the kitchen for determining jar-ring quality. Another test was added, namely, pinching the flange of the ring folded each way. The rubber should not show cracking under this treatment.

The sessions of the Rubber Division closed with the election of the following officers for the ensuing year.

CHAIRMAN: Dr. W. K. Lewis, Massachusetts Institute of Technology.

VICE-CHAIRMAN: George D. Kratz, Falls Rubber Co.

SECRETARY: Arnold H. Smith, The Goodyear Tire & Rubber Co.

EXECUTIVE COMMITTEE: J. M. Bierer, Boston Woven Hose & Rubber Co.; W. W. Evans, The B. F. Goodrich Co.; C. W. Sanderson, The Fisk Rubber Co.; J. W. Scott, Plexus Tire & Rubber Co.; George Oenslager, The B. F. Goodrich Co.

What the Rubber Chemists Are Doing.

THE NATURE OF VULCANIZATION.

By Dr. H. P. Stevens.¹

PART I.

THE COMBINATION OF RUBBER WITH SULPHUR.

TWO THEORIES have been put forward to explain the change which takes place in the physical and chemical properties of rubber when vulcanized. According to one theory, vulcanization is primarily an adsorption process; according to the second, a chemical reaction is involved, the sulphur entering into a chemical combination with the rubber hydrocarbon. It would, however, appear that those who uphold the physical theory admit the possibility of a subsequent chemical combination of the rubber and sulphur taking place, while the supporters of the chemical theory admit that adsorption of the sulphur may precede chemical combination. It remains to be shown whether or no the technical effect of vulcanization can be produced without any chemical combination between sulphur and rubber hydrocarbon taking place.

The systematic researches of Spence and his collaborators (*"Kolloid Zeitschrift,"* 1911, 8, 304; 9, 300; 1912, 10, 300; 11, 28, 274; 1913, 265), which in the main have been corroborated by later work, clearly show that sulphur enters into chemical combination with rubber during the ordinary vulcanizing process as, for instance, when a mixture of rubber and sulphur is heated for an hour or two at temperatures such as 130 degrees—150 degrees C. The velocity of the reaction is proportional to the time of heating at a constant temperature; the temperature coefficient normally lies between 2 and 3 (*Ibid.*, 11, 32), but is considerably influenced by catalysts (the so-called accelerators).

More recently the subject has been studied by Harries and Fonrobert (Berlin, 1916, 49, 1196, 1390); these authors, without controverting the work of Spence, claim that vulcanization is essentially a physical process and that vulcanized rubber can be prepared which is free from combined sulphur. This conclusion is based on one vulcanizing experiment only, carried out on a rather large scale. The acetone-extracted vulcanizate was practically free from sulphur. In the course of my own work on vulcanization I have made numerous sulphur estimations in acetone-extracted vulcanizates but have never obtained a figure comparable to that of Harries. It was therefore thought advisable to carry out a control of Harries' vulcanization experiment before proceeding with further research.

There are several points in regard to Harries' experimental procedure which are open to criticism. The rubber was mixed with 10 per cent of sulphur and disks vulcanized for a short time ($\frac{1}{2}$ -hour) at a fairly high temperature (145 degrees C.). The thickness of the disks is not given but, as these were used for tensile tests with a Schopper machine, they were probably 5—6 mm. thick so as to give a ring of standard size. It is doubtful whether sufficient time was given for the heat to penetrate evenly through so thick a layer of rubber, and it is probable that the outer layers were more fully vulcanized than the inner parts of the disks. It is stated that the conditions of vulcanization were similar to those technically used in the manufacture of inner tubes, but these latter usually contain an appreciable proportion of antimony sulphide in addition to the sulphur which facilitates the conduction of heat through the mass, also of "accelerators" which are capable of reducing the time required for vulcanization from one-half to one-third of that otherwise required. It is stated that the physical qualities of the vulcanized rubber were satisfactory, but the tensile figures are not given and the fact that the rubber became soft and sank together during extraction

points to very incomplete vulcanization. This does not happen with moderately under-vulcanized rubber. Harries and Fonrobert extracted a large quantity (500 grms.) with acetone for a long period (60 days).² At the end, the rubber contained only 0.29 per cent of sulphur. It was assumed that, given sufficient time, this residue would eventually have been removed and therefore the sample may be said to contain no combined sulphur. Owing to the large amount of rubber taken for extraction and the defects of the extraction apparatus, it appeared probable that this result would be more quickly obtained by the extraction of small samples, rolled very thin, using a form of apparatus in which extraction takes place at the boiling point of acetone (*Analyst*, 1913, 38, 143).

I determined therefore to vulcanize a mixture of Para³ rubber and 10 per cent of sulphur under the same conditions as employed by Harries, that is for 30 minutes at 145 degrees C., but in the form of a thin sheet $\frac{1}{2}$ —1 mm. thick so to obtain uniform vulcanization. At the same time a second experiment was made with the same mixture of rubber and sulphur, vulcanizing for 19 minutes only. It is well known that Para rubber from different sources varies in rate of vulcanization. The experiments were therefore extended to include a sample of fast vulcanizing plantation Para rubber. Approximately one-quarter of each sample was removed after 1, 2, 4, and 9 weeks, extraction (1 week = approximately 50 hours), and the sulphur estimated with the following results:

PARA-RUBBER A VULCANIZED IN STEAM AT 145 DEGREES C.

Period of extraction.	Combined sulphur per cent.	
	(1) 30 min.	(2) 19 min.
1 week	1.54	0.94
2 weeks	1.54	0.96
4 weeks	1.47	0.95
9 weeks	1.55	0.96

PARA RUBBER B.

(3) and (4) were vulcanized to correspond with (1) and (2) above. They were extracted for periods of 2 weeks and 9 weeks.

Period of extraction.	Combined sulphur per cent.	
	(3) 30 min.	(4) 19 min.
2 weeks	1.11	0.67
9 weeks	1.08	0.70

FAST VULCANIZING PARA RUBBER C.

This sample was treated similarly to B.

Analyses were made in duplicate.

Period of extraction.	Combined sulphur per cent. (5) 30 min. (6) 19 min.	
2 weeks	{ 2.69 2.33 2.39	1.40 1.53 1.47
9 weeks	{ 2.33	1.46

The vulcanized specimens were subjected to physical tests. Ring-shaped test pieces gave the following results—

Rubber sample.	Time of vulcanizing (minutes).	Breaking strain, grms. per sq. mm.	Final length (original length = 1).
(1) A.	30	830	10.7
(2) B.	19	490	11.2
(3) C.	30	750	11.1
(4) C.	19	290	12.2
(5) C.	30	1300	10.8
(6) C.	19	890	11.2

With regard to these figures, the breaking strain of (5) is only a little below that normally given for a fully vulcanized Para rubber. This sample contains about 2.4 per cent of combined sulphur whereas a fully vulcanized rubber usually contains 2.8—3 per cent calculated on the rubber (coefficient of vulcanization). The breaking strains of (1) and (3) are not much over one-half of what would be obtained if fully vulcanized. The

¹ Presumably the extraction was not carried on during the night as the apparatus was leaky. Sixty days may therefore be taken to represent about 500 hours.

² That is, derived from *Hevea brasiliensis*.

³ Dr. H. P. Stevens in *"The Journal of the Society of Chemical Industry,"* July 15, 1919.

final length (length at the moment of rupture) corresponds throughout with the breaking strain and tends to give a lower figure, the higher the breaking strain. It may be said that (1) and (3) are quite typical of a moderately under-vulcanized rubber. All vulcanized specimens, even those vulcanized for 19 minutes only, swell but do not dissolve in cold benzene.

These analytical results show clearly that, within the limit of accuracy of the sulphur estimations (the rubber being in the form of thin sheet), the whole of the so-called free sulphur is extracted in two weeks. A further seven weeks' extraction did not reduce the amount of combined sulphur. To judge from the figures for the rubber A, the extraction of free sulphur is complete in one week (say 50 hours), and for technical work a 5—10 hours' extraction is usually regarded as sufficient.

These results are in total disagreement with those obtained by Harries and Fonrobert. All three specimens of raw rubber contained over 1 per cent of combined sulphur after 9 weeks' extraction when cured for 30 minutes at 145 degrees C. (45 pounds steam pressure), whereas Harries and Fonrobert obtained only 0.29 per cent under less favorable conditions for the extraction of the free sulphur. When vulcanized for only 19 minutes, the figures for combined sulphur are more than double those obtained by Harries and Fonrobert. One can only conclude that these investigators were working with an excessively slow vulcanizing and inferior quality of rubber or that, owing to the thickness of the disks used and the short time of vulcanization, or for some other reason, the rubber was only surface vulcanized. It appears therefore that the technical effect of vulcanization has not been obtained without an appreciable amount of sulphur becoming insoluble in acetone, that is presumably combined with the caoutchouc hydrocarbon.

PART II.

THE ACTION OF SOLVENTS ON VULCANIZED RUBBER.

Although the process of vulcanization is of enormous technical importance, it is not possible to formulate a definition of vulcanization which will enable a sharp distinction to be drawn between a vulcanized and an unvulcanized rubber. Technically, vulcanization produces a physically improved product, showing greater indiffence to changes of temperature and greater tensile strength and elasticity. Of the ordinary soft vulcanized goods, 2—4 per cent of the sulphur cannot be extracted with acetone—the so-called combined sulphur. By "undervulcanizing," the amount is smaller and the product is softer and physically weaker, as already shown in Part I. If the vulcanization be carried to its limits, hard resilient solid (vulcanite or hard rubber) is produced, and up to 32 or 33 per cent of sulphur may remain undissolved after prolonged acetone extraction.

Solvents such as benzene and carbon bisulphide are frequently employed to differentiate between vulcanized and unvulcanized rubber (compare Harries, Berlin, 1916, 49, 1196), on the assumption that vulcanized rubber is insoluble and unvulcanized rubber soluble, but tests with different solvents under different conditions showed that the "solubility" of vulcanized rubber in organic solvents is dependent on (1) the nature of the solvent, (2) the time of immersion in the solvent, (3) the temperature, (4) the degree of vulcanization, and (5) the age of the vulcanized specimen. I have already remarked on the progressive solubility in benzene of rubber "vulcanized" with benzoyl peroxide ("Journal of the Society of Chemical Industry," 1917, 109), the rubber tending to insolubility in benzene with intensification of the vulcanizing conditions as, for instance, by increasing the proportion of benzoyl peroxide. Vulcanization with sulphur and with benzoyl peroxide is therefore analogous as regards the physical properties and solubility of the vulcanizate.

RAW RUBBER. It is generally assumed that raw rubber is soluble in solvents such as benzene and carbon bisulphide, but in many cases the solubility is only partial after months of

immersion in the solvent. It is necessary to distinguish between:

(a) Rubber obtained by evaporation or coagulation without mechanical working—at the most, a pressing of the clot to expel part of the mother liquor and facilitate drying. To this class belong the so-called plantation sheet rubber, "fine Pará," and most wild sorts.

(b) Rubber which has been worked (créped) after coagulation in the moist state or by subsequent working (mastication) of the dry rubber of the type described under (a). The working, whether créping or mastication, is accomplished by passing the rubber through differentially geared rollers.

Rubber in category (a), when immersed in a solvent, swells considerably unless of low quality, i.e. degraded* rubber which is soft, adhesive, or even semi-fluid, owing to unsatisfactory treatment in preparation or preservation. Taking the case of plantation sheet or dry Pará rubber, the rubber swells enormously and gradually passes into solution, the mass of rubber retaining its swollen skeleton form. After a long period and treatment with fresh solvent, the skeleton may collapse, leaving a slimy deposit rich in nitrogen. It is probable that the retention in shape and only gradual dissolution is caused by a network of protein films formed when the rubber is coagulated. This is particularly the case with rubber coagulated with tannin or products containing tannin which act on and toughen the protein films. The reticulated structure of these films is microscopically visible if thin pieces of the rubber are swollen in benzene with due care.

Rubber in category (b) readily dissolves in benzene; the amount of swelling depends on a variety of circumstances, including the degree of working to which it has been subjected.

Caspari ("Journal of the Society of Chemical Industry," 1913, 1041), separated samples of rubber into a soluble and a "pectous" variety by prolonged extraction with petrol ether in the cold. I have repeated Caspari's experiments but was unable to obtain concordant results in repeat extractions. The proportion of soluble to "pectous" appeared to depend on the period of extraction. Moreover, I found that the "pectous fraction," if allowed to stand sufficiently long in cold petroleum spirit, dissolved wholly with the exception of a small quantity of slimy nitrogenous matter which settled to the bottom of the containing vessel, so that the behavior of petroleum spirit as a solvent differed from that of benzene in degree and not in kind. Petroleum spirit is merely a less effective solvent than benzene.

Raw and vulcanized rubber exhibit varying behavior when immersed in a solvent. This should be noted as indicating the degree of "solubility." The most readily soluble rubber dissolves with little or no swelling, almost like a crystalloid. A less easily soluble rubber swells before dissolving. As the volume of the gel increases, more difficulty is experienced in producing a permanent emulsion with excess of solvent. Vigorous shaking is necessary and eventually one arrives at a stage when gelatinous flakes remain "undissolved." This marks the limit of "solubility." Beyond this stage, the more fully the rubber is vulcanized (i.e., the higher the percentage of combined sulphur), the less the rubber swells in the solvent.

VULCANIZED RUBBER. No investigations have been published dealing with the solubility of vulcanized rubber in solvents such as benzene and carbon bisulphide. The general impression is that vulcanized rubber is insoluble in contrast to the solubility of raw rubber. In connection with the previous paper it was important to ascertain the lower limit of combined sulphur which would confer the property of insolubility in organic solvents. Preliminary experiments showed that the quantity of combined sulphur required to confer insolubility as above defined was very small, and it was therefore found impracticable to vulcanize at the previous temperature of 145 degrees C. as the

* The term "degraded" is usually employed, but the presupposes a molecular change for which proof is wanting. I therefore prefer the term "degraded."

time of heating was too short and the temperature of the steam digester could not be raised sufficiently rapidly to enable accurate measurements to be made of the time of heating. Therefore a lower temperature was chosen. Specimens consisting of 90 parts of raw rubber and 10 parts of sulphur were vulcanized for 30, 40, 50, and 60 minutes at 125 degrees C., at which temperature the rate of vulcanization was reduced to about one-seventh of that at 145 degrees C.

The following figures were obtained after exhaustive extraction of the vulcanized specimens with acetone at the boiling point:—

Minutes Vulcanized at 125 Degrees C.	Sulphur Per Cent.
10	0.27
30	0.39
40	0.45
50	0.45
60	0.54

These figures show that the percentage of combined sulphur is approximately proportional to the time of heating, as in the case of more fully vulcanized rubber.

After standing 24 hours, small pieces of the vulcanizates were allowed to swell in benzene overnight. On shaking, (1) dissolved readily, giving an apparently homogeneous solution; (2) appeared to be only partly dissolved and the solution was rosy; (3) gave a swollen mass which was broken up on shaking, gelatinous lumps remaining visible; (4) was unaffected by shaking, the swollen mass remaining unbroken. We have therefore the transition states between solubility and insolubility of the vulcanizate in benzene, and according to Harries, (1) might be taken as the unvulcanized or metastable form, while (4) certainly represents the stable or vulcanized form. On this basis about 1/2 per cent. of combined sulphur is sufficient to confer the property of insolubility in benzene.

(To Be Continued)

SWELLING OF RUBBER IN SOLVENTS.

For rubber, the rate of swelling in a solvent depends on the nature of the liquid used; the origin and purity of the rubber; the coefficient of vulcanization, and the temperature. The rate and extent of swelling are believed to provide a more rapid and reliable indication of the "nerve" of rubber that is given by viscosity measurements. Most of the materials present in technical raw rubbers, such as resins, do not interfere with the "turgescence" curve, but the natural proteins retard arrival at the critical point at which the rubber loses its tenacity and resistance to stretching, and it is claimed that their quantity can be estimated from this effect.

With vulcanized rubber, the greater the proportion of mineral fillers and of factice the more rapidly this "critical point of turgescence" is attained. Decrease in the proportion of rubber and increase in that of sulphur diminishes the rate of swelling. The rate of swelling may be measured gravimetrically or volumetrically. The latter being more convenient. A modification of Justin-Mueller's apparatus for the examination of cotton during mercerization ("Journal of the Society of Chemical Industry," 1914, page 1201) is recommended for this purpose.

The order of various solvents in their effect on vulcanized rubber has been found experimentally to be tetrachloroethane, carbon disulphide, carbon tetrachloride, petroleum spirit (boiling at 158-212 degrees F.), and benzene. The rate of swelling in the boiling solvents or their vapors is much greater, but the results for the various solvents are less comparable, due to the differences in temperature. The advantage of tetrachloroethane over carbon disulphide at the same temperature is only slight by volume, but much greater by weight. The relative positions of petroleum spirits and benzene are reversed if the swelling is measured by increase in weight.

The values of the swelling constant, x , calculated by Kirchoff's

formula $Q = KSx$, where S is one hundred times the specific gravity of the solvent, K the volume before swelling, and Q the maximum volume, were found to be as follows:

Solvent.	Swelling Constant.
Tetrachloroethane	2.107
Carbon tetrachloride	1.872
Carbon disulphide	1.747
Benzene	1.672
Petroleum spirit	1.245
Heptane	1.227
Tetrachloroethylene	2.072
Pentachloroethane	1.987

PREPARATION OF RAW RUBBER.

In reviewing recent investigations on the production of raw rubber, E. de Wilde van finds that fine hard Para is generally not superior to plantation rubber. In the preparation of plantation rubber it is advisable to avoid excessive dilution of the latex; use the least quantity of coagulant; use bisulphite, and smoke the rubber at not exceeding 55 degrees C. (133 degrees F.). Smoking should begin one day after milling the rubber and continue for two weeks after the rubber is dry. Sheet rubber is superior to crepe, and the latter is better thick than thin. It is recommended that as few forms of rubber as possible be made and preference is given to smoked sheet. ("Le Caoutchouc et la Gutta-Percha," volume 16, 1919, pages 9826-29.)

COAGULATION OF HEVEA LATEX.

Reviewing the researches on latex coagulation, G. Vernet shows that the results obtained with latex preserved by the addition of ammonia may be very misleading, and that it is necessary to use fresh latex. This may account for some of the results by the advocates of the enzyme theory of coagulation.

Regarding the various theories advanced by others, the author concludes that the function of the protein constituents of the latex is of first importance in coagulation. All the experiments made in this connection can be explained by the reactions of these proteins. Coagulation results from an insoluble condition of the proteins. Drying and centrifugal separation are not alone able to produce coagulation, but may assist separation in presence of ordinary coagulants. Without the use of coagulants these processes simply increase concentration of the latex and gradual coalescence of the rubber globules, leaving the proteins entirely removable by washing. While the possible activity of enzymes during spontaneous coagulation of latex cannot be denied, it is significant that their presence has not been directly demonstrated and that coagulation can be explained satisfactorily without assuming their existence.

Latex below 39.2 degrees F. can be preserved perfectly for more than a month, and by tapping with careful exclusion of micro-organisms and collecting in sterilized glass tubes it is possible to obtain samples which remain liquid a month or more.

Spontaneous coagulation can be satisfactorily obtained with ordinary latex by adding one to ten grams of sugar per liter, excluding air during coagulation and maintaining the temperature at 86 to 113 degrees F. Serum from a previous coagulation or a selected growth of micro-organisms may be employed as a further aid. Latex so treated will coagulate with perfect evenness if diluted with several times its bulk of water.

CHEMICAL PATENTS. THE UNITED STATES.

PRESERVATIVE COMPOSITION for treating rubber fabric, comprising a mixture of tar, pitch, resin, rubber cement, fish glue, glycerine, and turpentine. (Richard E. Thierfelder and John Schmalzle, Jr., Milwaukee, Wisconsin. United States patent No. 1,312,007.)

PROCESS FOR VULCANIZING RUBBER, which comprises mixing an organic vulcanizing agent and red lead with rubber and vulcan-

A. Dubois. "Le Caoutchouc et la Gutta-Percha," 1919, pages 9781-9783; 9813-9819.

"Le Caoutchouc et la Gutta-Percha," 1919, pages 9835-9844.

izing the mixture. (Sheldon P. Thacher, Weehawken, New Jersey, assignor to Revere Rubber Co., Providence, R. I., United States patent No. 1,312,144.)

METHOD OF RECOVERING RUBBER SOLVENT in the manufacture of articles by the dipping method. The dipping form, coated with the rubber solution, is passed through a bath which is mutually soluble with the rubber solvent but not with the rubber. The solvent is recovered from the bath by agitating the latter with oil, permitting the mixture to settle and separate, the solvent being taken up by the oil. (John D. Morron, Lakewood, Ohio, assignor to The Mechanical Rubber Co., New York City. United States patent No. 1,312,452.)

THE DOMINION OF CANADA.

PROCESS FOR REGENERATING VULCANIZED RUBBER by which finely divided rubber is heated in an oil-jacketed vessel, after removal of its contained air by vacuum, to a uniform high temperature. (The Dunlop Co., Limited, assignee of Douglas F. Twiss, both of Birmingham, Warwick, England. Canadian patent No. 192,356.)

VULCANIZING PROCESS. An accelerator for the vulcanization of rubber consisting of an alkali metal dissolved in a fluid or readily fusible organic hydroxy-compound other than glycerol or glycol and of predominant hydroxylic character, such as butyl or amyl alcohol or an aromatic hydroxy-compound such as phenol. (The Dunlop Rubber Co., Limited, Westminster, London, assignee of D. F. Twiss, Sutton Coldfield, Warwick, both in England. Canadian patent No. 192,470.)

THE UNITED KINGDOM.

LAMP BLACK is rendered dustless by mixing with water to form a paste, adding 2/5 per cent of resin oil, and then heating to drive off the water. (E. L. Curbisley, Wood Lea, Albert Road, Cheadle Hulme, Cheshire. British patent No. 127,770.)

VULCANIZABLE PLASTIC COMPOSITION. Example of proportions is: 60 parts of reclaimed rubber, 30 parts of leather waste, and 10 parts of ground tire cover. The product may be used as a substitute for leather or for solid tires, floor coverings, engine packing, pump valves, etc. (W. S. Smith, The Drive, Fulham Road, London. British patent No. 127,932.)

CEMENT for the repair of apertures in submerged ships consists of five parts by weight of crude rubber dissolved in naphtha; three parts of rosin; two parts of white lead; nine parts of coal pitch; and one-quarter part of shellac. The mixture is used hot to cement metal surfaces and may be applied to cloth to form an adhesive patch. It may be thinned with naphtha and used as a paint. (V. Revello, 28 George street, Cardiff, Glamorganshire. British patent No. 128,755.)

GERMANY.

REGENERATION OF VULCANIZED RUBBER is effected by heating the material to a high temperature without melting, in a vacuum or in an inert gas. The harmful effect of the air on heated rubber is avoided by rapid cooling by treatment with cold water or solutions of sodium carbonate or alkali. (B. J. F. Varinhorst, The Hague, and J. G. Fol, Delft, Netherlands. German patent No. 302,995. March 19, 1914.)

PROCESS OF SEPARATING FIBROUS MATERIALS FROM VULCANIZED RUBBER GOODS. The material is finely divided and stirred for a short time with slightly warm water. The fibers become wet more easily than the rubber and sink, while the rubber particles float and are skimmed off the surface. (W. Golombek, Spandau, German patent No. 303,171, June 24, 1916.)

OTHER CHEMICAL PATENTS.

THE FRENCH REPUBLIC.

N. O. 490,730. Process of making a product to replace ebonite, bakelite, and other similar substances. Naamloze Vennootschap Seledische Maatschappij tot Exploitatie van Optische Fabrieken.
492,140. Process of manufacturing a substance having caoutchouc as a base. The Goodyear Tire & Rubber Co., Akron, Ohio.

LABORATORY APPARATUS.

ALUNDUM CRUCIBLES AND THIMBLES.

ALUNDUM is an electric furnace product of exceptionally high melting point. It is made of fusing the extremely refractory mineral, *sandalite*, a natural hydrate of aluminum, with a pure aluminum oxide in an electric furnace of the arc type. The refractory material thus produced contains from 92 per cent to practically pure aluminum oxide, depending upon the material fused. Alundum not only has a high melting point, but it is not easily affected by chemicals and has a high heat conductivity.

ALUNDUM EXTRACTION APPARATUS.

Alundum is also prepared in various porous forms for laboratory use in filtration and for extracting soaps, fats, food, rubber, etc., by both organic and inorganic solvents, after the arrangement shown in the illustration. (Norton Co., Worcester, Massachusetts.)

ELECTRIC HEATER FOR THE DISTILLATION OF GASOLINE.

The instrument shown in the illustration is constructed according to a new idea in electric heaters designed in accordance with suggestion of Dr. E. W. Dean, of the United States Bureau of Mines.

The spiral heating coil of nichrome wire is inserted in a conical spiral groove, turned in a solid block of insulating material. The separate turns of wire are in contact with the insulating block for only a small part of their circumference and, as a result, practically no heat is wasted by absorption in the block. The conical shape of the depression in the block, combined with the high heat-radiating qualities of the material used, causes practically all of the heat to be focused upon the 1½-inch

ELECTRICAL GASOLINE DISTILLATION HEATER

opening in the transit top of the heater. As a result the flask containing the gasoline is subjected to an intense heat (sufficient to ignite paper immediately) without the danger of breakage due to contact with a bare flame or a red hot coil. A variable rheostat is mounted in the same case with the heating coil, permitting the temperature to be raised or lowered at will. An enlarged view, and partly in section, is shown in the illustration.

Many additional uses will be found for this device in the laboratory, as it furnishes a rapid and efficient source of concentrated heat which will be found preferable to a gas flame for many operations. (Central Scientific Co., 460 East Ohio street, Chicago, Illinois.)

Dr. A. VAN ROSSEM will teach the chemistry and technology of rubber in the department of chemical technology in the Technical High School, at Delft, Holland.

New Machines and Appliances.

PORTABLE TANK FOR RUBBER CEMENT.

THE ECONOMICAL DISTRIBUTION of rubber cement to the various departments is a question of interest to all manufacturers that use this material.

The cement tank shown in the accompanying illustration is mounted on rubber-tired wheels and may be easily moved by one man who keeps the individual containers filled throughout the entire factory.

The pump measures one quart with a full stroke of the plunger, or any intermediate quantities may be drawn by adjusting the quantity stops, and a discharge register tells the quantity of cement discharged from the pump. A hollow-ball expansion chamber, permits expansion of the liquid in the pump cylinder due to changes in temperature.

BOWSER RUBBER CEMENT TANK.

The galvanized steel tank is heavily reinforced, all seams being riveted and soldered from the inside and outside to insure against leaking, and all openings are practically air-tight. The top is flanged and bolted to the shell and may easily be removed for cleaning and a hand-operated agitator insures uniform consistency of the rubber solution. (S. F. Bowser Co., Inc., Fort Wayne, Indiana.)

RUBBER MILL EQUIPPED WITH INDIVIDUAL MOTOR.

Electric drives for mill lines are common in large rubber plants, but this method of drive is not always possible or practical in the smaller rubber mills. Even in the large plants individual

INDIVIDUAL MOTOR-DRIVEN MILL.

mills are required for special work far from the mill-line, for instance, the warming mills in the calender room.

For such installations and the small rubber manufacturer, the individual motor driven mill shown in the accompanying illustration has been designed.

It is substantially constructed with a rigid one-piece bed-plate that supports the mill, drive and motor. The jack-shaft bearing is contained in the housing frame and is of the ring-oiling type. The outboard bearing is also ring-oiled and the reducing gears are machine cut. This type of mill is built with two sizes of rolls; 16 by 42 inches and 18 by 50 inches. (Wm. R. Thropp & Sons Co., Trenton, New Jersey.)

STACKING TOTE BOXES.

A new form of stacking steel boxes adapted for use with rubber compounding ingredients is here illustrated. It is stiff in construction, has spot-welded embossed runners which present the only line of friction and remove wear from the bottom in dragging over the floor. Spot-welded guides on the ends guide the boxes into stacking position when they are allowed to drop one into another. These guides in conjunction with the runners also serve to prevent any sideways shifting of boxes while being trucked.

COMPOUND BOXES.

Box weights do not vary more than two per cent and are furnished liquid tight if desired. It is claimed for this box that it combines maximum strength with minimum weight. (The New Britain Machine Co., New Britain, Connecticut.)

BALL-BEARING GRINDER AND POLISHING LATHE.

Improvements are constantly being made in the machinery employed in tire making, for example, the refinement of the buffing stand. The rough-looking, carelessly-built contrivances of cast iron and steel of former years have been replaced by well-designed machines, built of the best materials and according to modern methods of construction.

The type here pictured is mounted on a rigid base measuring 20 by 28 inches. The steel spindle revolves in ball-bearings, and measures 1.77 inches in diameter at the bearings and 1.25 inches between the flange, while the length is 45.25 inches over all. It is belt driven from a counter-shaft and weighs 550 pounds net. (The Webster & Perk Tool Co., Springfield, Ohio.)

TIRE-BUFFING STAND.

AUTOMATIC CONTROLLER FOR GAS HEATED MACHINES.

This device is primarily intended for repair vulcanizers but it is also designed for use on all other gas-burning steam generators, boilers, etc.

This attachment makes possible a constant and even steam pressure at all times and under all conditions. It allows a full flow of gas to bring the steam pressure to the desired point quickly and then automatically cuts down the flow of gas to the exact amount needed to hold that steam pressure. Once set, it requires no further attention.

STEAM PRESSURE
CONTROLLER.

(The Alliance Controller Co., Alliance, Ohio.)

SCALES FOR AUTO TIRES AND TUBES.

Tire and tube factory methods include checking up the weights of finished tire carcasses and inner tubes to insure uniformity of product. This is usually done on ordinary scales that have been changed over for this particular purpose.

The accompanying illustration of a scale expressly designed for weighing inner tubes explains itself. For auto tires it is made in two capacities, 10 pounds, and 15 pounds, both weighing by one-half ounces. The dial of these scales is 13 inches in diameter, and fitted with a nickel-plated brass sash and glass measuring 15 inches over all. They are provided with oval-shaped brass platforms for conveniently holding the articles to be weighed. (John Chatillon & Sons, 85-95 Cliff street, New York.)

INNER TUBE SCALE.

A PORTABLE TIRE INFLATOR.

THE HAND-TYPE LECTROFLATOR.

It is not at all surprising that the bulky tire-inflating apparatus so often seen in garages and service stations should be supplanted by a more easily handled device. But it was hardly expected that a light, easily operated and efficient machine of the hand-portable type would ever be serviceable as a practical tire inflator. However, the makers of the machine here shown confidently describe its construction and merits.

The two-piece cast-iron housing encloses the motor, gear-train and the compressor cylinder forming an air-jacket through which air is circulated by an enclosed fan. The piston and connection rods are of aluminum alloy and the piston is fitted with six ground piston rings. The puppet type valves are of brass with ground seats. The internal gearing, cylinder and shaft bearings are grease lubricated by positive systems.

The smallest machine has a capacity of two cubic feet of free air per minute, sufficient to inflate a 34 by 4 tire from flat to 80 pounds in 1 3/4 minutes. (The Black & Decker Manufacturing Co., Baltimore, Maryland.)

MACHINERY PATENTS.**MACHINE FOR FORMING SOLID TIRES.**

THE MACHINE illustrated is designed to cut and apply to a solid tire base unvulcanized rubber to desired and gradually diminishing widths, placing the rubber on the rim auto-

matically while holding and rotating the rim. The apparatus consists of a frame suspended opposite the lower rolls of a calender on which frame is mounted cutting disks, or knives, the sharp edges of which are held in loose contact with the middle calender roll carrying a thin sheet of unvulcanized rubber, from which they cut a strip of rubber. This strip is simultaneously carried to the wheel rim upon which it is continuously wound until the desired height is obtained.

SOLID-TIRE-BUILDING MACHINE

In operation, a supply of rubber having been prepared, the wheel rim A is placed in position over an off-center supporting roller B, the weight of the metal rim presses firmly against the driving roll C, which in turn presses firmly against the lower calender roll D. The wheel rim is held in place as it revolves by the supporting roller B and side guide rollers E and on the driving roller C by side guide rollers F. A strip of rubber of proper width is started from the middle calender roll and guided over roller C to the wheel rim A. As soon as the rubber is built up to the top of the wheel rim flanges the operator moves an eccentric cam lever, this raises a triangular cam which increases the distance between the rubber cutting knives G, making the next layer of rubber sufficiently wide to extend across the edges of the flanges. Each additional layer of rubber pushes up the triangular cam, permitting a spring to pull the knives closer together and making each layer a little

New Goods and Specialties.

BLOCK'S SPIRAL SPRING FORCE CUP.

DEALERS in kitchen utensils and household furnishings will be glad to know about the force cup shown here, which is suitable for use wherever the ordinary force cup could be used. In addition, it is claimed that this cup is particularly

efficient because of its special construction. It is made of the best quality of rubber, with a spiral spring of oil-tempered steel inserted in the edge, and a thirty-six-inch wood handle finished to look like mahogany. The handle is recessed so that the clamp that holds on the force cup may secure it tightly. Both the clamp and the spring are sherardized, making them rust-proof. Besides making the force cup stronger and more efficient in use, the spiral spring helps it to maintain its shape. It is claimed that this

SPIRAL SPRING FORCE CUP.

cup has a force of about fifty-eight pounds, or thirty-six more than the ordinary four-inch one. (Cumming-Forster Corp., 220 South State street, Chicago, Illinois.)

"REELASTIC" WINDS UP WITH A KEY.

The woman who uses elastic will be glad to know about the kind illustrated below. It winds up on the reel with a key when it is not in use and does away with the inconvenience of having to disentangle it from other articles in the sewing basket before it can be used. The new feature of this key-winding reel for elastic is the slot at the left of the key, which is marked with a scale to show how many yards of elastic are left out of the original twelve. (The American Mills Co. of New York, 395 Broadway, New York City.)

"REELASTIC" GORNER WEBBING

NEW STEP-PLATE.

A new type of service step-plate for the running-board of automobiles is made of rubber and fiber composition without metal inserts. The upper illustration of the two shown herewith indicates how the ribs of the tread are formed by a special process in which the long interwoven fiber follows the rib formation.

SINGLE UNIT STEP-PLATE.

It is claimed that this kind of step-plate does not get slippery in wet weather, like one of rubber only, and that the surface does not crumble and break off with continued wear; also that the device will not warp, spread, buckle, or rust, since no metal enters into its construction. (Service Rubber Co., 144 Oneida street, Milwaukee, Wisconsin.)

TIRE SHOES AND RELINERS FROM PULLED FABRIC.

The vulcanizer and motorist are now being offered tire shoes

and reliners made from high-grade "pulled fabric," etc., derived from specially selected tires originally built from Sea Island fabric and Pará friction. These are buffed, skived, and cut to fit, for the repair man, or painted and cemented ready for use. (The Lowenthal Co., 947 West 20th street, Chicago, Illinois.)

GOLF AND WEAR "SHIRTHOLDS."

A new device which dealers are finding profitable is called the "Shirthead."

THE "SHIRTHEAD"

It consists of a strip of high-grade rubber four inches long, bearing rubber teeth similar to those of a rubber tooth-brush, but not so long; this strip is attached at each

end to a safety pin. A pair of "Shirthead" worn inside the trouser waist-band, directly over the hips, will, it is claimed, make the shirt down and the trousers up in spite of strenuous action on the part of the wearer, at the same time acting as a cushion for a tight belt so that suspenders may be dispensed with. Being of rubber, the teeth will not injure the finest fabric. A patent has been granted on the invention. (The Shirthead Co., 324-328 Washington street, Green Bay, Wisconsin.)

THE "TRIPLE AIRLESS"—A NEW TIRE.

Another development of the "airless" tire is illustrated below.

The white spaces at the top and sides of the sectional view indicate shock-absorbing chambers which relieve the tire bridge. This bridge, in turn, is constructed so as to insure a perfect lock, while the beads are of extra heavy construction. The tire is frictioned by a method which is claimed to eliminate fabric separation, and a cushion of special quality is provided at the tread. (Triple Airless Tire Co., Manorville, Pennsylvania.)

"TRIPLE AIRLESS" TIRE.

THE EDWARDS SECTIONAL SOLID CUSHION TIRE.

A tire for trucks has been devised that is made in sections. If one of these sections is injured in any way or wears out, it can be replaced without disturbing the others and without taking the wheel off the truck. The only tools required are a hammer and monkey wrench, or, when applying for the first time, an

NEW SECTIONAL TIRE

ordinary brace and bit in addition, for boring dowel holes into the felloe one-half inch in diameter and one-half inch in depth.

The sections, twelve in number, are made to fit standard S. A. E. wheels and can be applied to

touring cars as well as trucks. When used on touring cars, the tires are placed on a light wheel by using a tire band which rests on six small lugs about one-quarter-inch from the wheel-band. (The Edwards Rubber Co., Akron, Ohio.)

A TOY SEAPLANE TO ASSEMBLE.

Some manufacturers who had the foresight to see how popular practical toys in line with the interests of the day would be, took advantage of the situation and developed

LAWRENCE NAVAL SEAPLANE.

specialties that have proved to be of more than temporary benefit to dealers who handle them. These include the airplane and the seaplane.

The seaplane shown above is 36 inches long assembled, and is equipped with a pair of 16-inch stream-line, hollow, single-step seaplane floats. The metal parts are aluminum and the wing covering, silk. The motor is a strong band of Pará rubber.

This toy may be purchased, assembled or knocked down. In the latter form it includes 145 separate parts which the ingenious boy will delight to put together with the help of the scale, working, drawing and instruction book which come with the parts. (Lawrence Airplane Model & Supply Co., 569 West Van Buren street, Chicago, Illinois.)

A WHITE RUBBER COAT.

Those who desire a raincoat

SHOWERPROOF RIDING COAT.

that is different will be sure to admire the one illustrated

here, made of white rubber, trimmed with collar and cuffs of contrasting color and big pearl buttons. The armhole is large, with fitted sleeve, and there are two pockets.

SHOWERPROOF RIDING COAT.

For those who ride in all weathers, a showerproof riding coat has been specially designed for comfort and service. In the back is a vent formed by a fan-shaped saddle extension which folds inward, while the front extension shown in the picture permits the coat to fall comfortably over the pommel of the saddle. This coat is made in rubberized silk or gabardine in light or olive tan. Both the white rubber coat and the showerproof riding coat are furnished by a prominent sporting goods house. (Abercrombie

COAT OF WHITE RUBBER.

STYLISH RAINCOAT.

& Fitch Co., Madison avenue and 45th street, New York City.)

THE "LYNER TYRE."

A tire interliner, as its name implies, is constructed of especially strong, rubber-impregnated fabric, vulcanized over an aluminum mold, so that it fits the tire casing snugly without pinching the tube. The outside of the protector is lightly coated with rubber and a heavy layer of rubber cement which vulcanizes itself to the casing, eliminating slipping and possible friction. (Pelletier Rubber Co., Box 322, Cincinnati, Ohio.)

CLOTHES SPRINKLER.

The "Even-Spray" clothes sprinkler utilizes the principle of any ordinary shaker with perforated top. In this case, however, the top is made of rubber so that it may be stretched to fit the neck of any bottle, preferably a round one which is easy to grasp.

This sprinkler permits a more uniform and even application of water to the clothes to be sprinkled than can be accomplished by hand. The sprinklers are packed by the two dozen on display cards with easel backs. The cards themselves are packed in strong cartons which protect them from becoming soiled or broken. (The Elyria Specialty Co., Elyria, Ohio.)

"EVEN-SPRAY" SPRINKLER.

A PRACTICAL RAINCOAT.

A good-looking, practical raincoat is illustrated at the right of the central picture. It is made of rubberized fabric in changeable color effect, with raglan sleeves and a simple turnover collar. A belt slips under side-straps formed by the extensions of the pocket overlaps and similar straps ornament the cuffs. The coat fastens in double-breasted style, with large buttons. (Holstein, Young & Co., 34 West 27th Street, New York City.)

PNEUMATIC INSOLE.

A pneumatic insole for shoes has been devised, which takes the form of a thin rubber sack covered with thin, rough cloth and paper. This sack is divided by transverse partitions perforated with small holes so that air can pass from one compartment to the next. A tiny valve is located in the instep, by means of which the insole may be inflated. If desired, a rubber tube with bulb attached may be fastened to the valve, the shoe may be put on and laced up, and the insole then inflated to suit the requirements of the wearer's foot.

PNEUMATIC INSOLE.

Thus a combined insole and arch support is formed, which it is claimed will cure soft corns and otherwise contribute to the comfort of the wearer, since the weight of the body is

distributed evenly all over the sole instead of in certain spots only. This device is patented. (B. A. Spinney, 110 Ewing Apartments, Des Moines, Iowa.)

The Obituary Record.

BRITISH COMMERCIAL COMMISSIONER AT WASHINGTON.

IN THE PASSING OF SIR RICHARD CRAWFORD, the rubber trade of America loses one who rendered it conspicuous service during the troublous days of the Great War. Indeed had it not been for his fairness, foresight and infinite tact it is doubtful if rubber manufacture could have been continued except under great difficulty. What he did in rubber he also did in textiles and various commodities affected by the war. A very timely appreciation from the pen of A. M. Patterson of the Textile Alliance so well sums up Sir Richard Crawford's important work that we gladly give it in full:

The notices of the death of Sir Richard Crawford, which have appeared in the press on both sides of the Atlantic, have been so perfunctory that a few of his friends desire to make more generous recognition of the quality and importance of his work as Commercial Commissioner at the British Embassy during the War.

The first effect of the war on American commerce was to halt supplies of materials of which the British Empire was the principal or the only source. The extension of the contraband lists to include many articles always before free caused great resentment and aroused bitter criticism of the Government on whose naval and consular representatives fell the burden of enforcing the new rules.

When Sir Richard Crawford arrived in the United States in February, 1915, he found an acute irritation which it was his duty to relieve by the establishment of trade agreements and informal arrangements. They were then tolerated, but later recognized and subsequently in many cases taken over by the United States Government on its entry into the war. That they did not cause a breach was due in a large measure to Sir Richard Crawford. His tact in dealing with our citizens who did not understand and were reluctant to submit to restrictions which they believed our Government should actively resent, as well as his constant insistence on fairness to all and the correction of injustice, even when the aggrieved party had no legal case for redress, was continuing cause for admiration and respect to those behind the scenes. More than once his views placed him in opposition to his own Government's views; on at least two occasions he risked his influence at home, and on one occasion his entire career to carry his point, when he felt his country pledged to a course which others deemed inexpedient.

The same qualities which marked his dealings with the outside world made Sir Richard an ideal man to work with. He gave to his subordinates a full measure of consideration, authority and responsibility, and was rewarded by affectionate and efficient service. With those Americans who were associated with him he established a relationship which invariably became one of confidence and friendship, even though it may have begun on the American side with suspicion or resentment.

In addition to contraband, other subjects of great importance fell to Sir Richard. The supply of oil, finance, loans and arrangements, and the embargo upon the export of munitions which at one time seemed not improbable, were all in his province. In dealing with them he had the full confidence of his Ambassador and was himself in fact the Commercial Ambassador. Even before the United States entered the war his health was broken under so great a strain. Only flexible determination and the care of his wife enabled him to continue as he did for four years without intermission and practically without rest.

When completely broken health followed the death of Sir Cecil Spring-Rice and the end of the war, Sir Richard returned to England in the hope of a speedy recovery which would enable him to return to Washington, for he felt the need of sympathetic and wise management of the financial and commercial readjustments and the reestablishment of competition between the two countries and believed he could and should undertake it. He accepted a proffered post in Egypt only because he felt that he might find in that climate the strength which he could not regain in America. As late as last April he spoke of being able later to return to Washington and of his country's needs there,

as the faithful servant who plans the full measure of service, although it was already plain that even Egypt was beyond his failing powers. In this fidelity he was a worthy representative of that class which has made the British Empire both at home and abroad the unchanging force that it has been for two hundred years, regardless of fluctuations of popular opinion or local politics.

As it turned out in serving his own country Sir Richard as well served the United States. The measure of it is known only to those closely associated with him, because of the manner in which he sank his personality in his mission.

Sir Richard Frederick Crawford, G. C. M. G., K. B. E., was born June 18, 1863. In 1904 he came prominently into public notice as Commissioner of Customs, a post which he held until 1911, when he was made a K. C. M. G. From 1911 until 1914 he was adviser to the Imperial Ottoman Ministry of Finance, and received the Grand Cordon of the Ottoman Order of the Medjidié. When Turkey entered the war, however, he barely escaped from Constantinople with his life. On January 19, 1914, he was appointed a minister plenipotentiary in the diplomatic service, honorary rank. He was made Commercial Adviser to the British Embassy at Washington, D. C., November 15, 1914, and became Commercial Commissioner June 1, 1917. Three days later he was made a Knight Commander of the Order of the British Empire.

A PROMINENT TRENTON RUBBER MAN.

William Hall Servis, treasurer of the Hamilton Rubber Manufacturing Co., Trenton, New Jersey, died on September 19, 1919, at his home in that city after a long illness. He

broke down from nervous prostration last April and was obliged to give up his work. A month ago his condition became worse and he was confined to his room until his death.

Mr. Servis was born in Ringoes, Hunterdon County, New Jersey, January 6, 1855, being the son of Hiram and Sarah Servis. He was educated in the district schools and at a business college and for fourteen years was employed by the Buck Thorn Fence Co.

In 1896 he joined the Hamilton Rubber Co. and in time became its vice-president; in 1906 the Hamilton company bought the Combination Rubber Co. of Bloomfield, New Jersey, and Mr. Servis became president of that subsidiary. The success of the Hamilton Rubber Co. in recent years is attributed to the executive ability and the enterprising and progressive business methods introduced by Mr. Servis.

William H. Servis was a man of broad views, always interested in public questions. He was a member of the old Green Street, now the First Methodist Episcopal Church of which he was a trustee and treasurer. He belonged to Orpens Lodge No. 137, Free and Accepted Masons, of which

WILLIAM H. SERVIS.

he was a Past Master and also to the Trenton branch of the Mystic Shrine. He was a member of the Trenton Country Club and gave much to charity. He leaves his widow, one son, Frank W. Servis, and two sisters.

ONE OF KELLY-SPRINGFIELD'S OLDEST EMPLOYEES.

Announcement has been made of the death of H. P. Thompson, district manager for the Kelly-Springfield Tire Co., New York City, for the State of Texas.

H. P. THOMPSON.

Mr. Thompson was born in Texas about 33 years ago, and his entire business career was in that State. Previous to entering business he joined the United States Navy, serving as a gunner during the Spanish-American War, and seeing active service with the fleet at Santiago.

He then entered the employ of the Kelly-Springfield Tire Co. as salesman, working in Texas, under the St. Louis branch. As his business increased Dallas was made a branch, and he was appointed manager. Later, San Antonio and El Paso were made depot points, and he was appointed manager of the Texas district.

He is survived by his widow and mother.

PRESIDENT OF THE GOODYEAR RUBBER CO.

Frederick M. Shepherd, Jr., president of the Goodyear Rubber Co., New York City, died at his home in East Orange, New Jersey, September 17, aged 61 years.

Mr. Shepherd was a lineal descendant of Edward Shepherd, who came from England and settled in Cambridge in 1638. The father, Frederick M. Shepherd, was president of the Union India Rubber Co., in the early 'fifties, founder and president of the Goodyear Rubber Co. from 1872 to 1906, and president of the United States Rubber Co. from 1896 to 1902.

The son became connected with his father's enterprises in early life, and was secretary of the Goodyear Rubber Co., and succeeded to the presidency on the retirement of his father, carrying on the business in the same lines which had proven so successful. He also succeeded his father as president of the Orange Water Co., which was founded by the elder Shepherd, and held the same position with the East Orange Safe Deposit and Trust Co., which he was instrumental in establishing.

Mr. Shepherd is survived by his widow and three sons, one of whom, Newell C., is secretary of the Goodyear Rubber Co.

SEARGEANT ARTHUR W. HAZELL, OF THE ROYAL WARWICKSHIRE regiment, who had been with the Dunlop Rubber Co., Birmingham, England, for fourteen years, died in August as a result of the after-effects of gas poisoning. He enlisted in 1915.

FINCK BARYTES PRODUCTION INCREASES

The Missouri Baryta Co., St. Louis, Missouri, of which C. P. DeLore, president of the J. C. Finck Mineral Milling Co. is president, has purchased approximately 4,500 acres of baryta land in Washington County, Missouri, comprising the second largest baryta producing property in Missouri. The new equipment being installed will double the output immediately and quadruple it within a year.

In connection with this increasing production the J. C. Finck Mineral Milling Co. has bought the complete stock and equipment of the Lambert Coopers Works, St. Louis, and is moving them to the Finck plant. The Lambert works was one of the largest slack barrel plants in the city and had a capacity of 135 barrels per hour.

RUBBER INDUSTRIES ATHLETIC LEAGUE OUTING.

THE first annual outing of the Rubber Industries Athletic League, an organization formed last spring among the employees of the eastern offices of the large rubber companies, came off Saturday, September 27. The steamer *Hendrick Hudson* of the Hudson River Day Line took the R. I. A. L. and friends, to Bear Mountain, where a delightful day was spent.

An exciting baseball game was played between the Sterling team, the winners of the R. I. A. L. tournament, and a picked nine from the teams it had defeated during the summer. The athletic games, which were keenly contested, included a 100-yard dash, a 440-yard run, a half-mile relay race, a three-legged race and a 50-yard dash for ladies. The day was thoroughly enjoyed by all who had the good fortune to take part in the excursion.

The first year's baseball competition of the Rubber Industries Athletic League has proved a great success, eight teams having been organized, which played to the close of the series. The number of competing teams will undoubtedly be larger next year.

The season ended on September 20, with the following result:

	Won.	Lost.	Percentage.
Sterling	17	2	.894
Goodyear	13	5	.722
United States Rubber	12	7	.631
Kelly-Springfield	12	8	.600
Tirestone	7	8	.466
Globe	5	11	.312
Ajax	3	14	.176
Goodrich	1	15	.065

The Sterling team, which may be seen in uniform in the accompanying illustration, had to fight hard to establish its superiority and win the silver trophy cup presented by THE INDIA RUBBER WORLD, as well as the pennant presented by the Kelly-Springfield Tire Co. The second prize, the cup presented by

THE STERLING BASE-BALL TEAM, WINNER OF "THE INDIA RUBBER WORLD" TROPHY CUP.

Left to right (standing): Otto Basten (manager of team and vice-president of the Sterling Tire Corp.); J. Messler, W. Thompson, H. Davis, J. B. Bourke (captain), W. Shary, S. Fredericks, and Spencer Welton (President of the Sterling Tire Corporation).
Seated, left to right: W. Sidy (manager), W. Jackson, J. B. Reynolds, A. Roach and W. White.

Baker, Murray & Imbrie, was won by the Goodyear team after a close struggle with the United States Rubber and Kelly-Springfield teams, the issue being settled only on the last day. The names of the twelve players who made the best individual records, and so won the watch fobs presented by A. G. Spalding & Brothers will appear in the November number.

The officers of the R. I. A. C. for this year are:

President—P. C. Botzenmayer, United States Rubber Co.

Vice-President—H. A. Demarest, The B. F. Goodrich Rubber Co.

Secretary—J. L. Wood, Ajax Rubber Co., Inc.

Treasurer—Bartlett Greene, Sterling Tire Corp.

The companies which so far are represented in the Athletic League are: Globe Rubber Co., Keystone Tire & Rubber Co.,

Kelly-Springfield Tire Co., Miller Rubber Co., Pennsylvania Rubber Co., Sterling Tire Corp., United States Rubber Co., Ajax Rubber Co., Inc., Empire Rubber & Tire Co., Federal Rubber Co., Firestone Tire & Rubber Co., The Goodyear Tire & Rubber Co., The B. F. Goodrich Rubber Co.

THE EDITOR'S BOOK TABLE.

DETERMINATION OF FREE CARBON IN RUBBER GOODS. BY A. H. Smith and S. W. Epstein, assistant chemists, has been published as Technologic Paper No. 136 of the Bureau of Standards.

THE details of the method described in the above pamphlet were published in THE INDIA RUBBER WORLD, January 1, 1919, page 197.

"STUBBS' BUYERS' DIRECTORY FOR THE WHOLESALE DRUG, Chemical and Allied Trades"; 388 pages, 6 by 9 inches. Alfred Stubbs, New York.

The 1919 edition of this standard work is "a classified list of manufacturers, importers and first hand wholesalers" and lists such materials as anilines, chemicals, dyestuffs, drugs, gums, oils, essential oils, and crude and raw materials, for manufacturers in important industrial chemical lines, including rubber manufacturers.

DYKE'S AUTOMOBILE AND GASOLINE ENGINE ENCYCLOPEDIA. By A. L. Dyke, E.E. Tenth edition. A. L. Dyke, St. Louis, Missouri. (Cloth, large octavo, 940 pages, profusely illustrated.)

The tenth edition of this voluminous work on the construction, operation and repair of automotive vehicles and gasoline engines of all sorts has made its appearance thoroughly brought up to date and containing, in addition to the sections on automobiles, trucks and motorcycles, much new material on tractors and airplanes. Two sections, comprising 27 pages, are devoted to tires and tire accessories of all sorts, the use, care and repair of tires, rims, air pumps, compressors, etc. Hundreds of half-tones, diagrams, charts, inserts, a comprehensive index and numerous supplements illustrate the text, and altogether the volume provides a remarkable compendium of ready reference for the motorist, cyclist and aviator.

NEW TRADE PUBLICATIONS.

"PNEUMATIC TIRE VALVE WRINKLES" IS THE TITLE of a 43-page cloth-bound book, vest-pocket size, published by A. Schrader's Son, Inc., Brooklyn, New York. Although compiled primarily for the use of the various branches of the United States Army and Navy, it is of value to every motorist and cyclist, acquainting him in a concise manner with all that it is necessary for him to know about tire valves, various allied accessories and their care, proper tire inflation, ascertaining air pressure, etc.

* * *

"THE STORY OF THE TIRE" IS THE TITLE of a VERY INTERESTING and instructive 67-page illustrated booklet published for distribution by The Goodyear Tire & Rubber Co. Beginning with the many uses of rubber and the discovery of vulcanization by Charles Goodyear, it recounts the growth of the Goodyear business, describes the great manufacturing plant at Akron, Ohio, the rubber plantations in Sumatra, the cotton plantations in Arizona and the fabric mills in Connecticut. How rubber is grown and prepared for market, and how it is used in the manufacture of tires of various sorts are concisely detailed. Altogether it is an exceptional piece of trade publicity.

* * *

BLACK & DECKER, BALTIMORE, MARYLAND, HAVE ISSUED A handsome 32-page catalog of their Electroflaters, electric air compressors, portable electric drills and electric valve grinders. The Electroflaters are found in numerous forms for private and garage use, ranging from small hand and wall devices to stationary and portable tank outfits. The air compressors are for pneumatic truck-tire inflation and operating pneumatic tools, etc.

DEPARTMENT OF COMMERCE BULLETINS, MISCELLANEOUS SERIES No. 81. "Selling in Foreign Markets," by Guy Edward Snider. In a volume of 637 pages the Bureau of Foreign and Domestic Commerce and the Federal Board for Vocational Education have combined to provide the American business world with information that may enable it to enter foreign markets with some chances for success. The information covers export sales problems, the export middleman, traveling salesmen, correspondence, catalogs, and advertising. There is a chapter on credits and one on delivery, packing, etc., making the book as a whole well worth reading by all who are planning to do business with foreigners.

* * *

The "Bulletin de l'Association des Planteurs de Caoutchouc," published at Antwerp, Belgium, comes to life again after a silence of five years during the German invasion. It announces that it must double its price and that it will deal with all tropical products as well as with rubber. These products will be taken into its rubber museum also, which luckily escaped the notice of the invaders and is nearly intact. Among other interesting articles, some of which are finely illustrated, is one on the rules of the Antwerp rubber futures market. The artistic colored cover shows a Malayan tapping a rubber tree.

* * *

"THE TRANS-PACIFIC," A FINANCIAL AND ECONOMIC MAGAZINE of international service, published at Tokyo, Japan, is a new publication which has just come to hand. It is a large, well-printed magazine having for its object to bring into closer business relations the activities and enterprises of the United States with those of the Far East and Australasia. A number of prominent industries of China, Japan, the Philippines, Australia, and Siberia are described, with ample illustrations in this number.

The editorial staff and contributors include several prominent business writers and officials in the Eastern countries. The main portion of the magazine is printed in English, but there is a Japanese section in charge of an editor of an influential magazine in Japan, and a Chinese section edited by a student of economic affairs in China and other Far Eastern countries. The magazine starts out with the promise of being both interesting and useful to American houses catering to foreign trade.

* * *

A NEW TIRE JOURNAL. UNDER THE EXCELLENT NAME, "Tires and Accessories" (Edward Lyman Bell, Inc., 373 Fourth avenue, New York City), a new journal makes its bow to the trade. It is evident from its leading articles, its wealth of trade news and its excellently arranged Table of Comparative Tire and Tube Prices that it aims to interest and assist distributors. The field is big and fertile and the initial number one of much promise. May success and its accessories attend it.

MEETING OF THE SCRAP RUBBER DIVISION OF THE NATIONAL ASSOCIATION OF WASTE MATERIAL DEALERS.

The meeting of the Scrap Rubber Division of the National Association of Waste Material Dealers was held at the Hotel Astor, New York City, on September 16. David Feinberg presided in the absence of Chairman Muehlstein.

A committee appointed to confer with the Rubber Reclaimers' Division of the Rubber Association of America with reference to the payment of interest on overdue accounts made its report. It has sent a letter to the Rubber Reclaimers' Division proposing that 6 per cent interest be allowed for any overdue period.

CHARLES E. MILLER, ANDERSON RUBBER WORKS, ANDERSON, Indiana, is building a three-story and basement addition of brick and concrete, 108 by 108 feet, to be used largely in the manufacture of tires, vulcanizers and other rubber-working machinery.

PENNSYLVANIA RUBBER CO. BUILDING HOMES.

The Pennsylvania Rubber Co., Jeannette, Pennsylvania, has recently purchased a tract of approximately 120 acres adjacent to its plant, and is plotting it out in streets now being graded, dividing it into about 600 house lots, on which it is erecting houses of modern design and construction. Twelve of these houses are already built, and 33 are now in course of construction.

HOMES FOR PENNSYLVANIA RUBBER CO.'S WORKMEN.

tion, to be completed next month. They are attractive and commodious, of stucco and brick, with up-to-date arrangements for lighting and heating. They are offered to the employees on liberal terms and are being taken so fast that the company will continue the erection of still more homes to solve the problem of housing its employees.

NEW INCORPORATIONS.

Acme Tire & Rubber Co., August 5 (Wisconsin), \$100,000. O. M. and J. M. Carter; A. Loell, Sr. Principal office, Milwaukee, Wisconsin. To manufacture and repair tires and rubber goods.
Acorn Tire & Rubber Co., Inc., August 25 (Delaware), \$1,000,000. M. C. Kelly; S. L. Mackey; J. D. Frock—all of Wilmington, Delaware. Delaware agent, Delaware Charter Guarantee & Trust Co., Du Pont Building, Wilmington, Delaware. To manufacture and deal in rubber and gutta percha.

Admiral Tire & Rubber Co., Inc., September 12 (New York), \$2,000. J. Jacobs; S. Bernheim; W. Loewenthal—all of 1877 Broadway, New York City. To manufacture tires, etc.

Aero Cushion Inner Tire & Rubber Co., May 17 (Michigan), \$500,000. B. A. Herrington, president; E. L. Sherbondy, vice-president; J. J. O'Shanney, secretary; C. E. Judson, treasurer; Dr. E. T. Grosvenor, principal office, 909 Ford Building, Detroit, Michigan. To manufacture and sell Aero cushion inner tire, automobile casing, bicycle tires, rubber heels, rubber cushions, rubber bumpers and other commercial rubber products.

All-In-One Auto & Tire Co., September 8 (Delaware), authorized capital 1,000 shares without nominal or par value. W. F. O'Keefe; G. C. Steigler; J. H. Dowdell—all of Wilmington, Delaware. Delaware agent, Corporation Co. of Delaware, 901 Market street, Wilmington, Delaware. To manufacture and deal in automobile tires and tubes.

Canon Rim Co., August 15 (Maryland), capital stock of 500 shares preferred stock at \$10 per share and 1,000 shares common stock without par value. W. G. L. Stille; E. E. Johnson—all of 563 Calvert Building, Baltimore, Maryland. Principal office, 563 Calvert Building, Baltimore, Maryland. To manufacture, buy, sell and deal in rims to be used on automobile wheels and other vehicles.

Compression Tube & Tire Corp., August 29 (Delaware), \$600,000. T. L. Croteau; H. E. Knox; S. E. Dill—all of Wilmington, Delaware. Delaware agent, Corporation Trust Co. of America, Du Pont Building, Wilmington, Delaware. To manufacture and deal in tires and inner tubes.

Dilatator Foreign Rights Corp., September 4 (Delaware), authorized capital, 10,000 shares without nominal or par value. A. W. Britton; P. L. Nieser; W. R. Randall—all of 65 Cedar street, New York City. Delaware agent, United States Corporation Co., 311 South State street, Dover, Delaware. To manufacture and deal in domestic and foreign patents in and for springs and all other articles of a similar nature.

F. M. Tire & Repair Co., Inc., September 13 (New York), \$15,000. W. B. McLaughlin, 335 Virginia street; E. H. Fahner, 149 Rodney avenue; E. W. Studd, 299 Highland avenue—all of Buffalo, New York. Principal office, Buffalo, New York. To deal in tires.

Gulion Rubber Co., Inc., May 5 (Ohio), \$25,000. J. N. Smeltzer, president and treasurer; E. F. De La Croix, vice-president; J. Kostler, factory manager. Principal office, 20 East 17th street, New York City. Factory, Guilford, Ohio. To manufacture rubber drug sundries and novelties.

Goodyear Tire & Rubber Co. of California, July 11 (California), \$200,000, H. Chandler; J. C. Drake; L. A. Phillips; J. F. Sartori. Principal office, Los Angeles, California. To manufacture tires, etc.

Hibbs Rubber Co., The, July 14 (Texas), \$100,000. G. H. Calvin, Fort Worth; R. L. Davidson, Greenville; E. B. King, Houston—all of Texas. Principal office, Fort Worth, Texas. To manufacture auto tires, tubes and machinery.

Hirsch & Co., Inc., Adolph, August 18 (New York), \$2,000,000. A. Hirsch, president; I. H. Hirsch, vice-president and treasurer; A. A. Glass, secretary. Principal office, 53 Park Row, New York City. To import rubber and other products from Brazil.

Independent Tire Co., August 4 (Kentucky), \$35,000. G. R. Davis; J. G. Rehkopf, Sr.; A. G. Oakley; E. J. Faxon—all of Paducah, Kentucky. Principal office, Paducah, Kentucky. To manufacture tires and tubes.
K. & S. Rubber Products Co., Inc., August 12 (New York), \$5,000. L. C. and A. J. Wilkens, both of 6939 Ridge Boulevard; C. J. Wolters, 428 Ovington avenue—all of Brooklyn, New York. To deal in rubber goods.

Klaus-Morr Battery & Tire Co., Inc., September 6 (New York), \$3,000. E. S. Klausner, 2194 Seventh avenue, New York City; L. A. Morrison, 17 Vista avenue; J. S. Neidich, 247 South Broadway—all of Yonkers, New York. To deal in tires.

London Rubber Co., August 27 (Pennsylvania), \$100,000. A. L. and H. London; A. C. Teplitz—all of Pittsburgh, Pennsylvania. Principal office, 906 Forbes street, Pittsburgh, Pennsylvania. To manufacture rubber cloth, raincoats and inner tubes.

Mendenhall Resilient Wheel Mfg. Co., August 25 (Delaware), \$3,000,000. T. L. Croteau; H. E. Knox; S. E. Dill—all of Wilmington, Delaware. Delaware agent, Corporation Trust Co. of America, Du Pont Building, Wilmington, Delaware. To manufacture and deal in vehicle wheels and resilient, elastic and spring wheels of all kinds.

Middletown Rubber Co., Inc., September 6 (New York), \$1,000,000. T. MacDonald; M. J. Friedman—both of 280 Broadway, New York City; S. Thompson. Middletown, New York. To manufacture rubber goods and druggists' sundries.

Norwalk Tire Sales Co., Inc., September 11 (New York), \$10,000. R. J. Gleichen; L. A. Arenas; F. P. Surgeon—all of 174 State street, Albany, New York. Principal office, Albany, New York. To deal in tires.

No-Tred Tire & Rubber Co., August 6 (New York), \$100,000. C. F. Hughes, 61 Broadway; C. G. Wheeler, 26 Liberty street; F. G. Ricker, 150 Nassau street—all of New York City. To manufacture tires.

President Suspende Co., The, August 15 (Massachusetts), \$400,000. J. M. Foster; P. C. Gray; J. F. Rollins—all of 60 State street, Boston, Massachusetts. Principal office, Shirley, Massachusetts. To manufacture and deal in suspenders, garters, webbing, etc.

Puritan Rubber Manufacturing Co., August 21 (New Jersey), \$250,000. F. Eberstein, Chairman; W. C. H. Jones, Jr., Jamaica Plain; M. Marcus Stoughton—all of Massachusetts; T. Gordon, Windsor, Trenton, New Jersey. Principal office, foot of Perrine avenue, Trenton, New Jersey. Agent in charge, T. Gordon. To manufacture, produce, buy, sell, export, import and generally deal in rubber and gutta percha.

Rubber Products Ltd., February 12 (Canada), \$50,000. H. J. Haslett, president and vice-president; A. B. Coste, managing director; A. E. Salisbury, secretary and treasurer; H. H. Clarke, director. Principal office, 105 Winch Building, Vancouver, B. C., Canada. To manufacture rubber goods.

Rubber Securities Co., July 23 (New York), \$10,000. J. Trapnager; F. J. Lumsden; P. P. Lortzer—all of 149 Broadway, New York City. To deal in rubber securities, etc.

Simpson & Wren, Inc., September 9 (New York), \$2,500. J. P. Simpson, 796 East 4th street; W. F. Wren, 1000 West 14th street, Moravia, side avenue, New York City; W. H. O'Neill, Weehawken, New Jersey. Principal office, Rockville Centre, New York. To manufacture tires, etc.

Singapore Rubber Co., September 11 (Singapore), \$100,000. E. P. Pyle, 106 East 85th street; I. Solomon, 616 West 207th street; E. P. Brown, 152 East 90th street—all of New York City. To deal in tires.

South Street Co., September 11 (New York), \$100,000. E. E. Nolan, 224 Railroad avenue; J. P. Hanlon, 462 Railroad avenue; A. Brown, 1417 Pittston avenue—all of Scranton, Pennsylvania. Delaware agent, Capital Trust Co. of Delaware, Dover, Delaware. To repair automobiles, automobile tires, and to sell automobile supplies and accessories.

Sweeney & Blanchard, Inc., September 19 (New York), \$25,000. C. R. and R. P. Sweeney, both of Westfield, New Jersey; G. A. Blanchard, 790 River Drive, New York City. To manufacture tires and rubber goods.

Welfare Tire & Rubber Co., Inc., August 27 (New York), \$5,000. J. Jacobs; S. Bernheim; W. Loewenthal—all of 1877 Broadway, New York City. To manufacture tires.

MOTOR ACCESSORY MANUFACTURERS' CONVENTION.

Sane optimism was the keynote of the third annual credit convention of the Motor and Accessory Manufacturers' Association at the Hotel Lafayette, Buffalo, New York, September 11 and 12. This attitude was almost unanimously reflected by the attendance of approximately 150 representative executives of the industry, including credit managers and general officers of leading automotive equipment companies throughout the country.

Although the two-day business sessions were devoted primarily to credit subjects, general conditions in the business world, and particularly the automotive industry, were discussed from all angles.

H. A. Tongue, credit manager of the Firestone Tire & Rubber Co., Akron, Ohio, was among the several speakers who discussed in great detail the broad and far-reaching usefulness of the association's credit department. Other rubber men in attendance were W. O. Rutherford, vice-president of The B. F. Goodrich Co., Akron, Ohio, also C. B. Reynolds, V. I. Montenyohl, W. I. Fornof, and E. S. Sargeant of the Goodrich company; W. D. Skinner, Republic Rubber Co., Youngstown, Ohio; N. S. Conover, Empire Rubber & Tire Co., Trenton, New Jersey; J. A. Lyons, Kelly-Springfield Tire Co., New York City; J. M. Tait, Federal Rubber Co., Cudahy, Wisconsin; W. B. Keiser, The Fisk Rubber Co., Chicopee Falls, Massachusetts; and G. Brewer Griffin, Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania.

News of the American Rubber Industry.

DIVIDENDS.

THE Ajax Rubber Co., Inc., New York City, has declared a quarterly dividend of \$1.50, which was payable September 15 on stock of record August 30, 1919.

The Apsley Rubber Co., Hudson, Massachusetts, has declared its semi-annual dividend of three and one-half per cent, payable October 1 on common stock of record September 30, 1919.

The American Chiclet Co., New York City, has declared its quarterly dividend of one and one-half per cent, payable October 1 on preferred stock of record September 21, 1919.

The Firestone Tire & Rubber Co., Akron, Ohio, has declared its regular quarterly dividend of one and one-half per cent, payable September 20 on common stock of record September 21, 1919.

The General Electric Co., Schenectady, New York, has declared its quarterly dividend of two per cent on stock of record September 15, payable October 15, 1919.

Globe Rubber Tire Manufacturing Co., Trenton, New Jersey, has declared its quarterly dividend of one and one-half per cent payable September 15 on stock of record August 3, 1919.

The B. F. Goodrich Co., Akron, Ohio, has declared its quarterly dividend of \$1 a share, payable November 15 on common stock of record November 5, 1919.

The Kelly-Springfield Tire Co., New York City, has declared its quarterly dividend of \$1.50 per share, payable October 1 on its six per cent preferred stock of record September 15, 1919.

The Keystone Tire & Rubber Co., New York City, has declared a stock dividend of fifteen per cent, payable September 15 on stock of record September 2, 1919.

The Pennsylvania Rubber Co., East Pittsburgh, Pennsylvania, has declared its regular quarterly dividend of 1 1/4 per cent on preferred stock and 1 1/2 per cent on common stock, payable September 30 on stock of record September 15, 1919.

The Plymouth Rubber Co., Canton, Massachusetts, declared its quarterly dividend of \$1.75 a share, payable September 2, on preferred stock of record August 5, 1919.

The Portage Rubber Co., Akron, Ohio, has declared its quarterly dividend of one and three-quarters per cent, payable October 1 on preferred stock of record September 20, 1919.

The Tyer Rubber Co., Andover, Massachusetts, declared its quarterly dividend of \$1.50 per share, payable August 15, 1919, on preferred stock.

The United Shoe Machinery Corp., Boston, Massachusetts, has declared quarterly dividends of \$1 a share on common stock and 3 1/2 cents a share on preferred stock, payable October 4, on stock of record September 16, 1919.

FINANCIAL NOTES.

H. S. Firestone, president of the Firestone Tire & Rubber Co., in his annual address to the directors of the company on September 5, 1919, explained why the capitalization has been raised to \$75,000,000. Said he:

It is less than three years ago that we increased our preferred stock from \$1,000,000 to \$10,000,000. At that time we had no idea of ever using more than \$5,000,000 of that preferred issue, and with that experience in mind and not knowing what the future might bring forth, we decided to make our preferred capital stock sufficiently large so that we could without expense and complications issue more at any time, and therefore it seemed advisable to raise from \$10,000,000 to \$50,000,000. It is necessary to have half as much common stock as preferred, and therefore it was necessary to increase the common stock to \$25,000,000. We do not intend to make any issue of common stock at this time, and when we do sell

it we hope that it may be possible to offer the common stock to our employees.

The August sales of the Firestone Tire & Rubber Co., amounted to \$10,000,000. The entire sales of the company in 1911 were only \$7,462,000. In other words, in the single month of August the company billed out 33 per cent. more goods than for the full year 1911. For the full year to October 31 next, Firestone will easily do \$90,000,000 of business and for the following fiscal year, making allowance for the effect of the expansion program, gross should considerably overtop the \$100,000,000 mark.

With a turnover in excess of \$5,000,000, The Fisk Rubber Co. had in August the biggest month in its history. Its subsidiary, Federal Rubber, also reached a new sales mark of \$1,500,000. The Fisk Rubber system therefore did a total business last month of \$6,500,000 or at the annual rate of \$78,000,000. In this connection it is interesting to note that actual sales of the parent company alone last year were but \$36,000,000. The operating profits of both companies last month were close to \$1,000,000, which charge-offs may reduce to approximately \$800,000. The Fisk earning power has more than kept pace all year with sales expansion and has now reached the point where it is forcing upon directors the necessity of considering common dividends.

The Republic Rubber Co.'s gross sales for September which are expected to exceed \$2,000,000, are running at a rate greater than at any other time in the history of the company. Indebtedness which falls due on October 1, has been anticipated with the result that the company's statement as of that date will for the first time in many years show current assets twice all current liabilities.

With an increase of approximately 56 per cent in sales volume for the first seven months in 1919, as compared with the same period in 1918, The Miller Rubber Co. shows every indication of breaking all of its previous records at the end of this year. The company did approximately \$16,000,000 business in 1918, and a \$23,000,000 figure was set for 1919. From present indications, the latter mark will be passed easily.

An \$800,000 increase in Miller common capital stock has been authorized. Stockholders may subscribe to new stock at \$100 par on a basis of one-fifth of their holdings. Miller common has been selling at better than \$200 for several months.

United States Rubber stockholders have ratified the plan calling for increase in capital from \$70,000,000 first preferred and \$40,000,000 common to \$100,000,000 first preferred and \$200,000,000 common. Out of 630,221 shares preferred outstanding, 440,026 voted for the plan and out of 360,000 shares common, 309,372 voted in favor.

The committee on securities of the Stock Exchange has ruled that transactions in common stock of United States Rubber Co. on September 12 shall be ex-rights unless made specifically for cash. Rights may be dealt in on and after September 11.

The capitalization of the Nebraska Tire & Rubber Co., Omaha, Nebraska, is \$500,000 of which \$300,000 is preferred, guaranteed 7 per cent. dividends, and \$200,000 common. No common stock has been offered for sale.

The balance sheet of the Ajax Rubber Co., Inc., June 30, 1919, compared with that of 1918, follows:

	1919.	1918.
Cash	\$761,365	\$581,010
Bills receivable	58,814
Liberty	183,033
Accounts receivable	4,877,150	4,979,235
Debtors	100,173	236,544
Inventories	6,539,700	1,126,492
Good will	1,874,875	1,874,874
Investment account	2,573	13,647
Plant, equipment, etc.	2,233,184	2,510,457
Total	\$16,614,026	\$15,548,260

	1919	1918	Increase.	Decrease.
Net earnings	\$1,886,730	\$1,919,608	\$32,878
Dividends	488,552	426,000	62,552
Surplus	1,398,200	1,533,608	135,466

The following comparative report is for six months ended June 30, 1919:

The following table shows the authorized capitalization of six of the large rubber companies on January 1, 1918, present authorized capitalization and amount of increase:

	Authorized Capital Jan. 1, 1918.	Present Authorized Capitalization.	Increase.
United States Rubber	\$120,000,000	\$100,000,000	\$180,000,000
Brunswick-Balke-Clender Co., preferred	84,600,000	109,600,000	25,000,000
Kelly-Springfield	13,900,300	20,900,300	7,000,000
Firestone	15,000,000	75,000,000	60,000,000
Firestone Tire & Rubber, preferred	39,500,000	42,000,000	2,500,000
Ajax	7,100,000	9,900,000	2,800,000

* Amount issued. Authorized capitalization of \$10,000,000 unchanged.

RUBBER COMPANY SHARE QUOTATIONS.

The following rubber stock quotations on September 22, 1919, are furnished by John Burnham & Co., 41 South La Salle street, Chicago, Illinois:

	Bid.	Asked.
Ajax Rubber Co., Inc.	88	89
Brunswick-Balke-Clender Co., preferred	103	104
du Pont de Nemours & Co., E. I., common	314	319
Firestone Tire & Rubber, common	177	182
Firestone Tire & Rubber, preferred	99 1/2	101 1/2
Fisk Rubber Co., The, common	43 1/2	44 1/2
Fisk Rubber Co., The (new), 1st preferred	99	101
Fisk Rubber Co., The, 2nd preferred	170	190
Goodrich Co., The B. F., common	77	78
Goodrich Co., The R. F., preferred	103 1/2	104 1/2
Goodyear Tire & Rubber Co., The, common	380	396
Goodyear Tire & Rubber Co., The, 1st preferred	106 1/2	108 1/2
Goodyear Tire & Rubber Co., The, 2nd preferred	107	109
Portage Rubber Co., The, common	144	148
Kelly-Springfield Tire Co., 1st preferred	95	97
Lee Tire & Rubber Co., The, common	29 1/2	30 1/2
Marathon Tire & Rubber Co., The, common	80	80
Miller Rubber Co., The, common	103	106
Rubber Products Co., The, common	138	143
Avoca Rubber Co., The, common	144	148
Swinehart Tire & Rubber Co., common	90	95
United States Rubber Co., common	112	113
United States Rubber Co., preferred	116 1/2	117 1/2

A FEW TIRE, AUTOMOBILE AND ROAD FACTS.

It is estimated that there were 7,000,000 automobiles in the world on January 1, 1919, and by actual count 6,146,677 of these, or about 87 per cent were in the United States—enough, if loaded to capacity, to give half the population of the country a ride at one time. This means that of some 38,500,000 tires now in constant use, about 34,000,000 are to be found in this country. Each of these six million odd cars, when operated on unimproved roads, costs twice as much for tire maintenance as when operated on surfaced roads, and there are approximately eight times as many miles of unimproved as of improved public roads in the United States. Of a total mileage of 2,457,334 only 296,290 miles are surfaced. The Department of Agriculture anticipates that expenditures for road construction will

reach \$500,000,000 this year. Most states are planning continuous systems of connecting highways, and Congress has made an extra appropriation of \$209,000,000 to meet the Federal part of the program. All of which means that average tire mileage is going to increase appreciably. Automobile men predict that the first of next year will see more cars in America than there were in the whole world the first of this year, so that the business of tire manufacture must continue to grow in order to keep pace with the increasing demand.

TRADE NOTES.

The Atlantic Rubber Manufacturing Corp., sales agent for Trann Rubber Co., 239 Fourth avenue, New York City, has increased its capital stock from \$15,000 to \$300,000.

The Traveler Rubber Co. of Bethlehem, U. S. A., 819 North Broad street, Philadelphia, Pennsylvania, has awarded the contract for its one-story plant, 91 by 333 feet, to be built in Lower Saucon Township, near Bethlehem, Pennsylvania, at an estimated cost of \$180,000, including equipment.

The Smith Chemical & Color Co., Inc., which was formed recently, will carry a general line of standard dry pigment colors, chemicals and fillers for the rubber trade. Casper Smith, whose portrait is shown herewith, was formerly connected with the Katzenbach & Bullock Co. as western manager and more recently as director of sales, is the president of the new company, and will personally supervise its business policy. The office of the new concern is located at 116 Nassau street, New York City.

The Beacon Tire Co., Beacon, New York, will build an addition to its factory to meet the increasing demand for its products.

The Plymouth Rubber Co., Canton, Massachusetts, has opened an office in the Everett Building, 45 East 17th street, New York City, in charge of E. J. Hooper. Mr. Hooper has been with the company for the last twelve years.

The Rebuilt Tire Co., Inc., 910-916 Second avenue, Long Island City, New York (see New Incorporations, THE INDIA RUBBER WORLD, September 1, 1919), will rebuild and retread tires and make pulled reliners for the trade. Charles D. Nolan is president; Charles F. Nolan, vice-president; E. L. Blessington, secretary, and Erich Gollubier, treasurer.

The Alling Rubber Co., 1126 Main street, Bridgeport, Connecticut, is building an extension to its store, to cost about \$25,000. Its premises will be nearly 200 feet deep when the work is completed, with fronts on both Main and Middle streets.

The Goodyear Cotton Mills, Inc., Killingly, Connecticut, are completing the building now being erected for a restaurant for employes. The structure is one story in height, 50 by 100 feet, of brick, and will accommodate between 175 and 200 people on the cafeteria plan, by which it will be operated.

The Franklin Soapstone Products Corp., which was incorporated about four years ago to work the deposits of talc in and around Danville and Saltville, Virginia, has recently completed its plant, and has a present capacity of 100 tons daily, but when further machinery now on hand is installed will increase its output to 150 tons per ten-hour day. The talc or soapstone is of a soft, velvety texture, and there is some of a blue, compact nature. The company proposes to pack its finer quality in small cartons for dusting powders for the tire trade.

"CRUDE RUBBER AND COMPOUNDING INGREDIENTS" AND "RUBBER MACHINERY," by Henry C. Pearson, should be in the library of every progressive rubber man.

CASPER SMITH.

PERSONAL MENTION.

H. L. McClaren, formerly president and general manager of the Ajax Rubber Co., Inc., New York City, and the Racine Rubber Co., Racine, Wisconsin, has divested himself of all other

H. L. McCLAREN.

interests and purchased a substantial holding in the J. & D. Tire Co., Charlotte, North Carolina, of which he was recently elected president and active general manager, succeeding William F. Smith, who resigned in his favor. Additional equipment is to be installed to allow increased production, and additions to the plant itself are to be built. In addition to its present product, the company is planning to manufacture cord tires and will

install special equipment for this purpose.

Installation of these can be started in the autumn.

A. J. Sobien, formerly secretary and treasurer of The Anchor Rubber Co., Barberton, Ohio, has resigned and become associated as a director with the newly organized Virginian Rubber Co. at Charleston, West Virginia.

P. A. Doyle, formerly general sales manager for the Ten Broeck Tyre Co., Louisville, Kentucky, has recently resigned and accepted the position of manager of the central district of the International India Rubber Corp., South Bend, Indiana, with headquarters at Kansas City, Missouri.

Harry M. Giles has been appointed general superintendent of the South Philadelphia Works of the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania. He succeeds the late Oscar Otto, killed in an automobile accident in August. For a number of years Mr. Giles has been superintendent of marine erection for the company.

E. T. Peterson, formerly district sales manager for the Commercial Car Unit Co., Philadelphia, Pennsylvania, has been appointed manager of the Pennsylvania Rubber Co., Jeannette, Pennsylvania, with headquarters at Buffalo, New York.

R. B. Pierce has been promoted to the position of district manager of the Kelly-Springfield Tire Co., with headquarters at 4600 Prospect avenue, Cleveland, the office of the company's Cleveland branch.

Alf P. Fischley has been appointed manager of the Kelly-Springfield Tire Co., 4600 Prospect avenue, Cleveland, succeeding R. B. Pierce.

C. O. Brandes has been appointed export manager for The Ideal Tire & Rubber Co., Cleveland, manufacturer of "Greyhound" tires and tubes.

J. C. McQuiston, manager of the department of publicity of the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, served as chairman of the exhibition committee of the Pennsylvania Electric Association which held its annual convention at Bedford Springs, Pennsylvania, on September 3-6, 1919. An unusual feature was the housing of the exhibitors in a large tent divided into separate booths with a wide aisle in the center.

Robert I. Wishnick, formerly general manager of A. Daigger

& Co., manufacturers, importers and exporters of chemicals, oils, and colors for the rubber trade, has been elected vice-president of the company.

Louis Birkenstein, of S. Birkenstein & Sons, Chicago, Illinois, rubber scrap dealers, has resigned his position as chief of the Surplus Property Division, office of the Director of Storage, his resignation becoming effective September 1, 1919.

Richard Blickenderfer, formerly with the Thermoid Rubber Co., Trenton, New Jersey, has been appointed manager of sales for the Dural Rubber Corp., Flemington, New Jersey, at Philadelphia, Pennsylvania.

H. G. Vanderhoef has been promoted to the position of general sales manager of the hard rubber and electric storage battery-jar department of The Brunswick-Balke-Collender Co., Chicago, Illinois.

Sam J. Turnes, until recently advertising manager of The Brunswick-Balke-Collender Co., Chicago, Illinois, has been promoted to the position of general sales manager of the tire department, succeeding John W. Maguire, resigned.

William J. McDavid, until recently associated with the Russian American India Rubber Co., the Treugolnik of Petrograd, has opened an office at 111 Broadway, New York City, and been appointed correspondent of L. Sutro & Co., London, England.

Dan McAvoy has been appointed manager of the Omaha, Nebraska, branch of the Pennsylvania Rubber Co., Jeannette, Pennsylvania. He has been acting as traveling representative of the company in Nebraska and Iowa.

Alfred Varian, Jr., formerly with Charles F. Garrigues Co., is now connected with the C. B. Peters Co., 15 Maiden Lane, New York City, and will continue to handle wood pulp for the trade.

A. E. Gordon has been promoted from the position of superintendent to that of general manager of the Beacon Tire Co., Beacon, New York.

George L. Sullivan, for three years advertising manager of The Fisk Rubber Co. of New York, Chicopee Falls, Massachusetts, has resigned to associate himself with the J. Walter Thompson Co., advertising agency, New York City.

Robert Duncan, of Duncan & Fraser, Limited, Adelaide, South Australia, is in the United States on business.

CANADIAN NOTES.

The Stanyon Rubber Co., Limited, is now located at New Toronto, Ontario, the factory being at 27 Brock avenue and the office at 25 Manning Arcade. The company manufactures dipped rubber goods, featuring toy balloons and nipples. The factory is of fireproof concrete construction, two stories high, with 30,000 square feet of floor space. The officers of the company are: Henry Stanyon, president; Charles H. Stanyon, vice-president; and Leonard L. Stanyon, secretary-treasurer.

The I. T. S. Rubber Co. of Canada, Limited, has recently removed from 28 Temperance street to 22-26 Mulock avenue, Toronto, Ontario.

George L. McCrae has been appointed manager of the sole and heel department of the Goodyear Tire & Rubber Co., Limited, Toronto, Ontario. He will be assisted by C. R. Harshman. Mr. McCrae has been with the company eight years, and will continue to manage the mechanical rubber goods department.

Ames-Holden-McCready, Limited, Montreal, Quebec, of which T. H. Rieder is president, has opened branches in Halifax, Quebec City, Ottawa and London, Ontario, and Calgary, and are planning to open branches in Regina and Saskatoon. Rubber footwear as well as leather will be carried.

IN THE BIG PLANT OF THE GOODYEAR TIRE & RUBBER CO., AT Akron, Ohio, 23,000 workers are employed. The factory continues in operation twenty-four hours each day, in three shifts of eight hours each.

THE RUBBER TRADE IN MASSACHUSETTS.

By Our Regular Correspondent.

Boston has been passing through a critical experience the past month, when the city police went on a strike, leaving the city unguarded, and many of its stores were looted by hoodlums, while criminals flocked here from other cities to take advantage of the lack of police protection. The state guard and the local militia were called out to police the city, thus drawing many men from business for such duty. Many, perhaps all the rubber factories, had employees who were thus called from their work and it is a credit to the industry generally that every man thus called to service has been paid his full wage during his absence from work, or the difference between his compensation regularly received and that paid by the state. The United States Rubber Co., which has thirteen factories in Massachusetts, took this view of the situation, as did the other manufacturers having fewer or less important establishments.

* * *

H. P. Ballard, secretary of the Boston Rubber Shoe Co., Malden, is the colonel of the Twelfth Regiment of the State Guard, and is on active duty in that capacity at present, with headquarters at the armory at Cambridge. Among his captains is E. H. Kidder, Boston branch manager of the United States Tire Co.

* * *

Stowe & Woodward Co., Newton Upper Falls, Massachusetts, has nearly completed a three-story extension to its main building, and is equipping it with the latest approved machinery for the manufacture of rubber-covered rolls of the largest dimensions. For some years this concern has made smaller rolls, such as are used in tanneries, bleacheries and dye works. But with the purpose of extending this department the new addition has been built, and the roll department has been placed in charge of Raleigh C. Adams, who was for 25 years with the Boston Belting Co., and for much of that time superintendent of the roll department. The equipment is adequate for covering paper-mill rolls of the largest dimensions, even up to those 250 inches in length, thus enabling the factory to meet the utmost requirements of the paper-making trade.

* * *

The New England branch of the Acme Rubber Manufacturing Co., Trenton, New Jersey, which has been located on Devonshire street near Summer street, Boston, for nearly a score of years, has been moved to 134 Summer street, where it occupies the entire second floor, thus giving a very commodious stock room where a line of "Red Letter" tires and tubes, a large variety of hose, and a good line of molded goods are carried. F. H. Albee, the New England manager, has been connected with this branch ever since it was started. He has a large acquaintance with the trade, and reports a marked increase in the business since his removal to the new location.

* * *

The Boston Belting Co. is pushing ahead with a very considerable domestic trade, and an export demand which is on the increase. At present the company is at work on a contract for several large conveyor belts, one of which is 42 inches wide and nearly 800 feet long. There is also a good demand in the hose department, including a large amount of oil suction hose for one of the large oil-producing companies. The export demand mentioned is mainly for hose, the company's brands having made a reputation for standard goods in several foreign countries.

* * *

J. C. Haartz, Inc., 10 High street, Boston, has equipped a rubber mill at New Haven, Connecticut, for the manufacture of caulked goods including materials for automobile manufacturers and spreader coated fabrics. "Paramount" auto top materials and "Haartz mackintosh cloth" will be featured. The Forsyth Dyeing Co. is a department of this concern, which

effects close cooperation between dye-house and rubber mill. The company is capitalized for \$1,000,000 common and \$500,000 preferred stock. The officers are: J. C. Haartz, president and treasurer; D. B. Stevens, vice-president; and Thomas Forsyth, assistant treasurer and general manager at New Haven. The above, together with Leslie Forsyth and L. A. Pickard, constitute the board of directors. The rubber mill is under the management of I. Frank Burnham, formerly superintendent of the Stoughton Rubber Co. Division of the United States Rubber Co., Stoughton, Massachusetts.

* * *

J. Frank Dunbar Co., Inc., importer and dealer in crude rubber, for a number of years at 201 Devonshire street, Boston, removes October 1 to 166 Essex street, Room 51. This is in a most convenient location, but a short distance from the South Terminal Station, and adjoining the commodious headquarters of the New England Shoe and Leather Association and the Boston Boot and Shoe Club.

* * *

The Tyer Rubber Co., Andover, Massachusetts, has added a line of standard cord tires to its regular output.

At the recent Welcome Home Celebration in honor of the Andover soldiers returned from the war, the Tyer company participated in the parade with four trucks arranged as floats, of which two represented "The Sinking *Lustania*" and "The Peace Table," bearing the slogans, respectively, "This started it" and "This finished it."

* * *

The C. & C. Rubber Co., Stoughton, Massachusetts, has discontinued its Boston office, and is concentrating its entire business at its Stoughton plant. A new building is in process of erection which will add about 7,000 square feet of floor space. The company manufactures raincoats, and has just added a new line of industry, the manufacture of blankets, having purchased a number of automatic looms from the American Felt Co., which has discontinued, and is dismantling its Hyde Park Mills department. The C. & C. Rubber Co. will start with an equipment of six looms, to be increased later as the new industry develops.

* * *

The Hood Rubber Co. is building a four-story brick structure at its plant at East Watertown, which, when completed, will enable the company to rearrange some details of the manufacture to expedite its business.

* * *

Colonel Harry E. Converse, president of the Boston Rubber Shoe Co., who has been in somewhat poor health the past six months, is now in the West recuperating, and reports are to the effect that he is steadily and rapidly improving.

* * *

At a recent meeting of the directors of the First National Bank of Boston C. Sinclair Weeks and A. Stanley North were elected assistant cashiers.

* * *

Miss M. G. Webber, for the last three years in charge of the outdoor advertising of The Fisk Rubber Co. of New York, Chicopee Falls, Massachusetts, has been promoted to the position of advertising manager of the company.

THE RUBBER TRADE IN NEW JERSEY.

By Our Regular Correspondent.

TRENTON RUBBER MANUFACTURERS report that business is good at the present time and that fall and winter prospects are excellent. The outlook for tires and tubes is very good while the other branches of the industry are also picking up following the summer months. The Ajax Rubber Co. has placed a number of new hands at work because of the increase in trade, and the United & Globe Rubber Co. is busy in all its departments at the present time.

The Thermoid Rubber Co., Trenton, has engaged the Oshorn Engineering Co., Cleveland, Ohio, to prepare plans for a three-story building, 100x275 feet, of reinforced concrete brick and steel.

The United States Rubber Co. recently unveiled a large bronze tablet at its plant at New Brunswick, New Jersey, in honor of the thirteen men who entered the war from that factory, and in honor of Chester Brokaw, who made the supreme sacrifice. Desher Wilmot, factory superintendent, was in charge of the services. Miss Hattie Brokaw, sister of Chester Brokaw, unveiled the tablet, which bears the following inscription: "In honor of the employees of the United States Rubber Company, Jersey factory, who at the call of their country, laid aside their vocations and entered the service to fight in the great war for world wide liberty, 1917-1919."

The Stanwood Rubber Co. is installing new machinery in its plant at Elizabeth, New Jersey, under the direction of Edward Hutchens, vice-president and engineer. A 175-foot stack is being erected for the 1,000-kilowatt power plant.

The pumping plant at the works of the India Rubber Co., New Brunswick, New Jersey, was partially destroyed by fire recently.

THE RUBBER TRADE IN OHIO.

By Our Regular Correspondent.

LITTLE INTEREST is shown here in resumption of trade with Germany, or in foreign trade as a whole. Domestic business is so good and the demand for tires so great that there is little time to think of the resumption of trade with Europe.

At the Firestone, Miller, Goodrich and Goodyear offices it is stated that the financial and credit situation in Germany is the greatest drawback not only to the rubber but to all trades, and that the lack of shipping facilities is another factor which renders commercial exchanges with Europe almost impossible. France, England and Italy, it is asserted, are making deliberate efforts to keep out American trade in order to foster their own industries, while Holland and Sweden are very anxious to get American rubber goods. The credit situation in both of these countries, however, is also unfavorable.

Local factories are looking to the Orient as the great coming market for manufactured goods. China and Japan are beginning to purchase rubber products in large amounts, and in a few years it is believed that the business with these countries will have risen to a high level.

AKRON NOTES.

All the Akron rubber companies have agreed to cooperate with the municipal university in a plan whereby employees will be able to work part of their time and spend the remainder in school. One of the plans sanctioned is that two men may hold one job, each working half of the regular shift.

Several companies have placed \$6,000,000 in the hands of their directors to solve the housing problem which is the chief cause of the inability of the rubber factories in Akron to meet the demand for tires.

The Home Owners Investment Co., embracing all the big rubber manufacturers and other Akron business men, are accepting applications from prospective home owners if the prospects have 10 per cent of the total cost of the home they wish to build, and to date approximately 200 houses have been started by those whose applications have been accepted.

The Coventry Land and Improvement Co., a concern which has been sponsored by H. S. Firestone, has taken out building permits for 62 additional homes to be built in Firestone park, making a total of 450 houses which the company will have built and sold within the past year.

The sales of the Firestone Tire & Rubber Co. from November 1, 1918 to September 1, 1919, amounted to \$69,475,197.14, which was an increase of more than \$3,000,000 over the same period of last year. August was the biggest month the company ever had, business being \$2,456,994.30 more than for August, 1918. The company will build a new \$400,000 factory in the rear of Plant No. 2 for the manufacture of tires.

The Firestone Tire & Rubber Co. is helping to reduce the high cost of living for their employees by opening a cooperative store in the Firestone Club House. The store is being operated on a cost plus ten per cent basis and is well patronized.

W. W. Wildman has resigned as president and general manager of The Portage Rubber Co., Akron, but will retain his position as a director and his interest in the company.

John W. Maguire, president of the Mid-West Rubber Manufacturers' Association, has been elected vice-president and general manager of The Portage Rubber Co., at Akron, Ohio, to fill the position of W. W. Wildman, who recently resigned. Mr. Maguire will have full charge of the company's affairs and will immediately inaugurate an energetic campaign for increased business.

Mr. Maguire has been identified with the rubber industry for over twenty years. He was formerly general manager of the rubber sales department of the Brunswick-Balke-Collender Co., having joined the organization when the rubber tire department was added to the company's activities about four years ago. Previous to this time Mr. Maguire was associated with the Republic Rubber Co., for 10 years.

JOHN W. MAGUIRE.

Reports from The Goodyear Tire & Rubber Co. indicate that the industrial democracy which was inaugurated in August is working even better than was expected by the employees.

The conduct of the company with regard to matters of policy as well as the settlement of all difficulties between the management and the men, is in the hands of two legislative houses made up along the lines of the national House of Representatives and the Senate. The whole factory has been divided into districts and wards, and the men vote for their representatives by the secret ballot system. In the House there are 80 representatives and in the Senate there are 40. P. W. Litchfield, factory manager, sponsored the system's adoption.

F. A. Seiberling, president of The Goodyear Tire & Rubber Co., upon his return from the West, stated that the plant being built by the company in Los Angeles is not to be taken as an indication that the company expects to cease growing in Akron.

The new plant is intended primarily to take care of the ever-increasing western trade. The cost of bringing crude rubber from San Francisco to Akron and then hauling the tires back over the same route can be materially reduced by building a plant on the Coast where the crude rubber of the Orient and the cotton of plantations in the Southwest can be brought together.

Mr. Seiberling stated that as soon as housing conditions made it possible the company will employ 10,000 more men in order to operate the Akron plant at 100 per cent instead of 70 per cent as at present.

George Hockensmith, well known in the aeronautic field, and formerly overseer of the Goodyear experimental station in Ak-

ron is reported as being the head of a \$1,000,000 trans-Pacific navigation company which is being organized in Los Angeles.

John F. Rae, for two years a member of the Bureau of Municipal Research in Akron, is the latest man drafted by the Goodyear Tire & Rubber Co. for an executive position. He is well known in New York, and recently assisted in a survey of the state institutions of Virginia.

A new aviation school has been opened in Akron with John F. Aston as general manager. The purpose of the school is to train air pilots and also to make photographs and carry passengers. Lieut. H. C. Miller is chief pilot.

The Mohawk Rubber Co., Akron, Ohio, organized six years ago, has found it necessary to construct a substantial addition to its factory, because of the heavy demand for its tires, and especially its cord tires, which are a comparatively recent

PLANT OF THE MOHAWK RUBBER CO.

addition to its line of manufacture. The accompanying illustration shows the factory as it is to-day, including the new building recently completed.

MISCELLANEOUS OHIO NOTES.

Buildings for several new rubber factories are being erected in the vicinity of Akron. The Arnold Rubber Co., with a capitalization of \$50,000, is constructing a new building in Ravenna. Rubber heels are to be the principal product and about 50 persons will be employed.

The Cascade Tire & Rubber Co. is breaking ground for its plant at Ravenna, Ohio. The capitalization of this company is \$1,000,000, and approximately 300 men will be employed when operations are begun. Tires will be the principal product.

The Mason Tire & Rubber Co., Kent, Ohio, reports progress in the erection of its new buildings which it expects to occupy by January 1, 1920. The additions comprise about 125,000 square feet of floor space and include a three-story heater room addition which will house six additional vulcanizers; a three-story calendar building; a three-story tire building; a complete two-story solid tire manufacturing plant comprising an entire wing, having its own mills, tubing machines, and vulcanizers; and a new garage to house company and employees' cars. At the same time the present cafeteria will be enlarged to three times its present size to accommodate the prospective additional employees of The Mason Tire & Rubber Co. and of The Mason Cotton Fabric Co. The office building is also being trebled. All the additions will be of reinforced concrete steel construction with brick facing.

The Anchor Rubber Co., Barborton, Ohio, which recently suffered the loss by fire of its leased plant at Columbus, has

purchased ground in Barborton and is erecting a two-story building, 45 by 100 feet, to cost \$25,000. The company will manufacture druggists' sundries, mechanical rubber goods, and advertising and toy balloons.

The Pharis Tire and Rubber Co., Newark, Ohio, has purchased five acres of canal property from the state and is now planning an addition for the increased production of fabric tires and the manufacture of cord tires. The new structure will be three stories high, 100 by 145 feet, with complete boiler house and steam plant. It is hoped that the new building will be ready for occupancy before winter.

The Pelletier Rubber Co., Cincinnati, Ohio, manufactures a tire interliner which it calls the "Lyner Tyre."

The Wayne Tire and Rubber Co., Orrville, Ohio, has succeeded to the business of the Orrville Rubber Co., and has assumed all liabilities and acquired all assets. The management, however, will remain the same, the change being only in name and ownership. H. R. Platt is general manager.

The Owen Tire & Rubber Co., Bedford, Ohio, has increased its board of directors from five to seven, adding O. M. Dickson, secretary-treasurer of The Tuscora Rubber Co. E. M. Blatz was reelected director and vice-president. Mr. Blatz is president of The Tuscora Rubber Co., which is building a new plant between Dover and New Philadelphia, Ohio.

The Galion Rubber Co., Galion, Ohio, has bought the Flat Iron Building, formerly leased, and will build a two-story addition. J. N. Smeltzer is president and E. F. de la Croix, vice-president.

PRESIDENT OF THE MASTER TIRE AND RUBBER COMPANY.

WILLIAM B. RUSTON, president and general manager of the recently incorporated Master Tire & Rubber Co., Dayton, Ohio, is peculiarly well-fitted by ability and experience for the position, having been in the rubber business more than a score of years. He entered the employ of The B. F. Goodrich Co., Akron, Ohio, as errand boy in 1897, and his rise was steady and sure, for five years later he was transferred to the Philadelphia branch as assistant branch manager. After eight years there he resigned and tires manufactured by the Lee formed a company to market the Tire & Rubber Co., Conshocken, Pennsylvania.

WILLIAM B. RUSTON.

From this business he resigned to become associated with the Thermoid Rubber Co., Trenton, New Jersey, as salesman, covering five States, and working up a business which placed him at the head of the sales force of that company in the amount of goods sold. After occupying this position for five years he accepted the offer of the Dayton Rubber Manufacturing Co., Dayton, Ohio, to sell its goods in certain territory on a commission basis. So successful did he prove in this work that the company management called him to the home office to take entire charge of the sales department, and this position he resigned last April to take an active part in the formation of The Master Tire & Rubber Co., which will manufacture cord tires at Dayton, Ohio.

NEW MCGRAW SALES MANAGER.

H. M. Bacon, the newly appointed sales manager of the McGraw Tire & Rubber Co., East Palestine and Cleveland, Ohio, is one of the most widely known executives in the automotive industry. As one of the pioneers, he became interested in the manufacture of motor cars in the early days, and for some time was identified with the industry in Detroit, Michigan. This gave him close touch with the tire and accessory field, and in 1911 he joined the Diamond Rubber Co., Akron, Ohio, three years later, assuming full charge of the sales of Diamond tires and accessories, a position which he held until August of the present year, resigning to accept the management of sales for the McGraw Tire & Rubber Co., with headquarters at Cleveland, Ohio. Previous to establishing himself there he is making a tour of all the McGraw agencies throughout the country to come into personal touch with the representatives and salesmen.

H. M. BACON.

MID-WESTERN NOTES.

By Our Regular Correspondent

THE Wilson Tire & Rubber Co., Springfield, Illinois, has recently completed a 100 by 200-foot addition to its factory building, in the form of a court to the old building, to be used as a vulcanizing shop. Two new vulcanizers and additional tire building equipment has been installed; the new addition and equipment representing an investment of about \$60,000.

The Lincoln Highway Tire Co. has placed orders for considerable additional machinery and equipment to keep pace with the growing demand for the company's tires and tubes. The company contemplates the building and equipment of a new unit early in 1920.

The Great Republic Tire & Rubber Co., with the executive officers in Muskogee, Oklahoma, which recently began operation of their new factory at McAlester, Oklahoma, plans to increase its production to 150 tires and 250 tubes daily. A full line of accessories as well as rubber heels and soles will also be manufactured. W. H. Owens is vice-president and general manager, and C. W. O'Donnell is factory manager. Mr. O'Donnell has had many years of experience in the manufacture of high-grade tires and tubes, having been formerly connected with the Mohawk, Racine, Perfector and others.

At a meeting of the board of directors of the Standard Four Tire Co., Keokuk, Iowa, July 18, three vacancies were filled, making the new board of directors as follows: J. B. Gabeline, Burlington, Iowa; Henry Trout, Mt. Pleasant, Iowa; W. G. Feignspan, Quincy, Illinois; L. L. Birkett, West Liberty, Iowa; James Guthrie, Hamilton, Illinois; T. Thompson, Brighton, Iowa; E. P. Armknecht, Donnellson, Iowa; E. S. Anderson, Oskaloosa, Iowa; Lee T. Gobble, Fairfield, Iowa.

A new addition is being added to the present plant which when completed, will increase the capacity from 500 to 1,000 tires and tubes a day. By the first of the year, this company expects to have a cord tire on the market. The personnel of the new organization follows: President and general manager, J. B. Gabeline; vice-president, T. Thompson; secretary,

C. O. Frazier; auditor and temporary treasurer, W. E. Vance; general sales manager, F. R. Eyer. Mr. Eyer was formerly western district manager of the Amazon Rubber Company of Akron, Ohio, and Mr. Frazier has been connected with the Standard Four Company ever since its organization.

The Archer Tire & Rubber Co., Minneapolis, Minnesota, is putting in a new battery of boilers which will double its power plant; also a converter for the calender and a new sixty-inch vulcanizing press. It has recently added a full line of equipment for all sizes of fabric casings and has increased its output in the past five months about 120 per cent. The production for the month of August will exceed 450 tires and 600 tubes a day. A year ago the production was 36 tires a day and no tubes.

The Ten Broeck Tyre Co., Louisville, Kentucky, has discontinued the manufacture of 2,500 mile guaranteed casings and will soon be in a position to fill orders on an 8,000-mile guaranteed semi-cord casing. The company has made some extensive improvements in its plant and the officials expect to direct their efforts towards the production of a casing that will give mileage far beyond the 8,000-mile guarantee.

Walter H. Grote, at one time connected with the United States Tire Co., The McGraw Tire & Rubber Co., and the National Tire & Rubber Co., is now factory superintendent and assistant general manager for the Archer company. Mr. Nicol, former general manager, has resigned and Robert J. Garrene, vice-president, has taken charge of the management of the company.

The Nebraska Tire & Rubber Co., Omaha, Nebraska, has recently completed its plant and is now prepared to produce 500 finished tires and tubes per day. The new factory building contains 35,000 square feet of floor space and has been equipped with new and modern machinery. The company owns one and one-half acres of land and its transportation facilities are excellent. The factory organization is headed by W. W. Wuchter, general manager, and J. W. Whighamias, chief chemist; both are experienced rubber men.

The Mason Tire & Rubber Co., Kent, Ohio, has appointed E. E. Gessert, manager of its branch office at 450 Jackson street, Milwaukee, Wisconsin, controlling the company's business in Wisconsin and northern Michigan.

The McGraw Tire & Rubber Co., Cleveland and East Palestine, Ohio, has appointed Harry R. Brownless district manager of the Michigan territory, with headquarters at Detroit.

The Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, has reopened its office at 1003 City Trust Building, Indianapolis, Indiana, in charge of Knox Easterling. This office was closed during the war, but increasing business has now made it necessary to have headquarters in Indiana.

The Premier Tire & Rubber Co., Montgall and Nicholson avenues, Kansas City, Missouri, has purchased a building at that address, containing approximately 20,000 square feet of floor space, and sufficient ground for another building 85 by 200 feet, three stories high, for which it is soliciting bids. The officers of the company are: Grover Joice, president; F. W. Willis, vice-president; O. W. Dunham, secretary and treasurer; L. E. McKim, the chemical engineer and rubber expert, has been secured as general manager. He was formerly with the Republic Rubber Corp., Youngstown, Ohio. The company is making tires and tubes by a special method called McKim's "Tensilene" process.

The Dural Rubber Co., Flemington, New Jersey, is now distributing its products through dealers in Denver and Salt Lake City. Edward R. Novak has recently been appointed the company's representative in charge of sales in the Central Western States. Floyd R. Biggs, formerly with The Fisk Rubber Co., Chicopee Falls, Massachusetts, is in charge of Western sales for the Dural company.

The Belden Manufacturing Co., 23d street and Western avenue, Chicago, Illinois, has let the contract for Building No. 8, four stories high, on West Van Buren street, to be 90 by 114 feet and contain approximately 10,000 square feet of floor space.

WEST VAN BUREN STREET PLANT OF BELDEN MFG. CO.

The structure will be of reinforced concrete, entirely fireproof, trimmed with red brick. Machines will be driven by individual motors as in the present factory, thus eliminating line shafts and belts.

The A. J. Stephens Rubber Co., 15th street and Chestnut avenue, Kansas City, Missouri, has increased its capital to \$1,500,000 for the purpose of manufacturing tires and tubes as well as its tire accessories and fabric products. A. J. Stephens, founder of the business three years ago, becomes president and general manager of the enlarged corporation.

RACINE AUTO TIRE CONFERENCE.

More than 200 branch managers, salesmen and department managers of the Racine Auto Tire Co. attended the sales conference at Racine, Wisconsin, September 23-25, which was presided over by Clarence H. Wright, the secretary-treasurer and general manager of the company.

CLARENCE H. WRIGHT.

over for the week of the conference, and golf, bowling and tennis were included in the schedule of entertainment.

This conference also marked the tenth anniversary of Mr. Wright's connection with the company, which in 1909 was manufacturing a leather-covered steel-studded tire. This tire was discontinued and through the efforts of Mr. Wright the "Horse-Shoe" tire was evolved and placed on the market. This year the company has added a cord tire to its line.

At the conference many plans were discussed for the further enlargement of the business. The Racine Country Club was taken

ROSENWALD & WEIL SALESMEN VISIT KINZIE RUBBER PLANT.

The Kinzie Rubber & Manufacturing Co., Chicago, Ill., entertained the business heads and salesmen of Rosenwald & Weil, clothing manufacturers, that city, on August 28, on the occasion of the six-day sales convention of the latter mentioned con-

cern. The party, to the number of 50 or 60, was conducted through the Kinzie factory, where the various processes were explained and the manufacture of rubberized fabrics and clothing demonstrated. At noon a substantial lunch was served and in the afternoon H. T. Kessler, general manager of the Kinzie Rubber & Manufacturing Co., gave a talk on "Rubber Goods and How They Are Made," and L. J. Ulber told "Why I Took Up the Selling of Kinzie Products."

The Friday session of the convention was devoted mainly to a golf tournament at the Harlem Golf Grounds, when trophies provided by Max Magnus, manager of sales of Rosenwald & Weil, were competed for.

PACIFIC COAST NOTES.

By Our Regular Correspondent

A. F. OSTERLOH, secretary of The Goodyear Tire & Rubber Co., has been elected vice-president and general manager of the new Goodyear company in Los Angeles, California. He

A. F. OSTERLOH.

started as a salesman in the Chicago territory four years after the organization of the Goodyear company and subsequently became branch manager and then manager of the western division of the sales department. He was brought to Akron as assistant secretary and in 1915 was made secretary.

It is expected that a large number of men from the Akron factory will be taken to Los Angeles as soon as the plant there is ready for operation.

The Advance Rubber Co., Brooklyn, New York, has opened a branch at 721 South Olive street, Los Angeles, under the management of William J. Hartman, who has been with the company for a number of years, both in the factory and as a salesman.

The Dural Rubber Corp., Flemington, New Jersey, is now distributing its products through dealers in Los Angeles, San Francisco, Portland, Seattle, and Spokane. E. H. Wilson, president and general manager of the company, has just been visiting the Coast, where he found business particularly good.

The Huntington Rubber Co., Los Angeles, has taken the agency of the Miller Ad-On-a-Tire of the Miller Rubber Co., Akron, Ohio.

M. G. Haines, Pacific Coast representative of the Polack Tire & Rubber Co., recently paid a short visit to Los Angeles. During the war he was a lieutenant in the quartermaster's department.

The annual get-together business meeting of the Los Angeles, San Diego and Arizona branches of the United States Rubber Co. was held recently in the general offices of J. B. Magee, manager of the Southern California division. Plans were mapped out for the fall drive and the progress that has been made by the company in the Southern California territory was shown in the figures submitted by Mr. Magee. The thirty-five members of the conference lunched at the Los Angeles Athletic club and wound up at one of the beaches.

Elmer S. Firestone, Los Angeles representative of the Firestone Tire & Rubber Co., Akron, Ohio, has purchased a home

in Los Angeles. After completing the organization of the San Francisco branch, he was called east to organize the Buffalo, New York branch. After several years there he was transferred to Los Angeles and has been in charge here ever since.

Frank A. Vanderlip, recently elected director of the United States Rubber Co., and former president of the National City bank of New York, who has been in Los Angeles for two weeks, was given a rousing reception by the San Pedro Chamber of Commerce just previous to his departure. Mr. Vanderlip is the owner of the immense Palos Verde ranch, which adjoins San Pedro and spent a quiet vacation at his residence there during his sojourn in Los Angeles.

In his address Mr. Vanderlip pointed out that all Europe is upset and unable to recover her financial and industrial equilibrium, and that the unrest has spread to this country.

"The solution of our problem of unrest will probably be found," he said, "but it will not be found by the men who are resentful toward capital, and are inclined to do just enough work to 'get by' from day to day.

"The great idea all must consider is production. The wealth of the world lies in the day's work. Russia didn't think of production. She divided up whatever there was in sight, and now that it is all gone she is starving."

Mr. Vanderlip pointed out that this country occupies the happy position of having all raw materials save rubber, and of being able to sell all it can produce. The big thing during the next two years, he thinks, is cooperation, that all may be kept busy at reasonable wages, maintaining production at a high point, in order to supply other countries which are unable to produce what they need because of raw material shortage and lack of credits.

C. L. Smith, Los Angeles, has been appointed Southern California distributor of Dural red tubes. E. H. Wilson, president of the Dural Rubber Corp., was in Los Angeles recently and covered much of the local territory with Mr. Smith.

R. G. Henderson, representative of the Gates Rubber Co., Denver, Colorado, has completed arrangements with the Warfield Tire Service Co. for handling the Gates Half Sole Tires in Los Angeles. A model Gates plant has been set up at 938 South Main Street.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

(739.) Request is made for addresses of manufacturers of woven fabric about $\frac{3}{4}$ inches wide, selvage both edges, made with wire warp and cotton weft.

(740.) Inquiry is made for the addresses of concerns making tire-branding irons.

(741.) A reader asks for the addresses of concerns handling black hypo.

(742.) A subscriber requests information about "Rub-R-Glu," including address of manufacturer.

(743.) A foreign correspondent desires to represent United States manufacturers of organic accelerators in France.

(744.) A Japanese correspondent desires to secure the agency for the following rubber goods: Billiard cushions, printers' blankets, matings, garden hose, and steam hose.

(745.) A subscriber inquires for the addresses of manufacturers of sheet zinc for use on cutting tables.

(746.) A request has been received for addresses of manufacturers of joint hammering machines.

(747.) A reader inquires where the following can be obtained: "Algin gum," "Ruberoid," "Cellin," and "Insullac."

(748.) An inquiry has been received for the addresses of makers of instruments for measuring hardness and resiliency of rubber.

(749.) A writer asks for compounds for dipped goods and the acid and vapor cure.

(750.) A manufacturer asks for the address of the makers of "Saxolin," a paper product which can be frictioned with rubber compound.

(751.) Inquiry is made for the address of the manufacturer of "Textilose," an unfriictioned paper product.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

Addresses may be obtained from the Bureau of Foreign and Domestic Commerce or its district or cooperative offices. Requests for each should be on a separate sheet, and state number.

(30,474.) A manufacturing company in Greece desires to secure an agency for the sale of pneumatic tires. Correspondence may be in English.

(30,502.) A firm in Russia, which is opening a branch office for the distribution of supplies for hospitals, doctors and dentists, desires to purchase rubber articles for sanitary use. Correspondence may be in English.

(30,510.) The partner of a firm in France desires to be placed in communication with manufacturers of canvas who specialize principally in duck for pneumatic tires, with a view to selling this article to French manufacturers.

(30,519.) A merchant from Cyprus, who is in the United States for a short time, desires to secure an agency for the sale (30,562.) A manufacturing chemist in Bohemia desires to of rubber goods in Cyprus and Syria.

purchase large quantities of rubber goods. Quotations, with samples, are requested.

(30,564.) An agency is desired by a merchant in France for the sale of canvas shoes with best quality of rubber soles. Quote c. i. f. French port. Correspondence in French.

(30,575.) A man who has been in the United States for several years now planning to go to England, desires to secure the agency for the sale of rubber overshoes.

(30,578.) A firm in Italy desires to purchase elastic webbing. Quote c. i. f. Italian port. Terms cash on receipt of goods. Correspondence in Italian.

(30,589.) A dealer in France desires to purchase or to handle on commission or consignment rubber tires.

(30,592.) An American export corporation is soon to send a representative to Europe and invites immediate offers from manufacturers of tires and rubber goods. Catalogs in duplicate and price lists, subject to confirmation, are requested.

(30,602.) A commercial agent in Czechoslovakia desires to secure agencies for the sale of solid tires.

(30,603.) A company of commission agents in France desires to secure agencies for the sale of rubber.

(30,625.) A commercial agent, representing a firm in Sweden, is in the United States and wishes to purchase rubber goods for hats.

(30,650.) An agency is desired by a man in Italy for the sale of pneumatic tires. Quotations should be given c. i. f. Italian port. Correspondence in Spanish.

(30,679.) A firm in Roumania desires to purchase rubber articles. Correspondence may be in English.

OIL FROM HEVEA SEEDS.

Hevea seeds contain 52 per cent of oil, from which a good quality of dark fat can be made, or with sulphur chloride it forms a white fat darker than that obtainable from colza and castor oils, and resembling that made from linseed oil. (A. Dubosc in "Le Caoutchouc et la Gutta-Percha.")

Activities of The Rubber Association of America.

DIVISIONS MEETINGS.

RECLAIMERS' DIVISION. The meeting referred to in the September issue as planned for Tuesday, September 9, was postponed indefinitely due to the inability to secure a quorum. A meeting will probably be arranged for early in October.

THE RUBBER CLOTHING DIVISION. The Rubber Clothing Manufacturers' Division and the Calendered Rubber Clothing Section of that division held meetings at the Yale Club on September 4, which were well attended and interesting because of the number of important subjects given attention and the spirit of constructive cooperation that marked the manner in which the subjects were handled.

THE TRAFFIC DEPARTMENT. On September 18 and 20 the Traffic Department held the largest meeting since its inception, both from the standpoint of the attendance and the number and importance of the subjects given attention. The Traffic Committee was in session two full days and, besides disposing of the large docket, was in conference with officials of the American Railway Express with a view to bringing about an alleviation of certain conditions now existing in connection with the transportation of rubber products by express, and it is believed that when the conclusions of the conference are put into practice the result will be beneficial to the trade.

MECHANICAL RUBBER GOODS DIVISION. On Friday, September 19, there was held a meeting of the Executive Committee of the Mechanical Rubber Goods Manufacturers' Division at the Yale Club followed by luncheon and a general meeting of the Division, which was unusually well attended. Plans were laid for the strengthening of the status of the Mechanical Goods Division in its relation to its membership and several specific subjects of interest to mechanical goods manufacturers in general were given attention. The Executive Committee voted to hold a regular monthly meeting on the third Tuesday of every month beginning with October, 1919, in line with the program for the increasing of the efficiency and importance of the work of the Division.

TIRE DIVISIONS. There was held a joint meeting of the Executive Committee of the Pneumatic and Solid Tire Manufacturers' Divisions September 23, which was full of interest by reason of its being the first meeting of the sort for several months and because of there having been received by the Association from tire manufacturers a number of subjects of importance involving trade principles and practices which were thought to need attention. A docket including more than a dozen subjects of broad interest was disposed of besides several other matters which were brought up during the course of the session.

RUBBER SUNDRIES. A call has been issued by the Association for a meeting of the Executive Committee of the Rubber Sundries Manufacturers' Division for the evening of October 7, at the Union League Club, New York City, and on the following day, October 8, at 1 p. m., a general meeting of the Division is to be held at the Yale Club.

TRADE INFORMATION SERVICE.

The Association has just concluded arrangements with a Washington Bureau for the furnishing of a daily trade information service which will place the Association in a position to inform its membership promptly of the development of matters of interest, and which will provide a more authoritative and prompt source of information on many important matters than has been available to the Association heretofore.

INDEX TO MANUFACTURERS IN THE RUBBER INDUSTRY.

The Rubber Association is preparing to reissue the "Index to the Manufacturers of the Products of the Rubber Industry,"

which was issued by the War Service Committee in May, 1918, in order to bring it up to date in respect to those changes in manufacturers' lines which may have followed the conclusion of the war, and to correct certain inaccuracies which found their way into the first issue.

WORLD'S COTTON CONFERENCE.

There is strong likelihood of arrangements being effected for the attendance of representatives of the rubber industry at the World Cotton Conference in New Orleans in October, which appears to be very desirable, when consideration is given to the relation of the rubber industry to the cotton industry, in the matter of consumption.

THROUGH EXPORT BILLS OF LADING.

New York, August 26, 1919.

To the non-members of The Rubber Association of America, Inc.:

As you are probably aware, the United States Railroad Administration has resumed the acceptance of through export bills of lading via the North Atlantic Line, after they are found on written ocean contracts and only when shippers give written guarantee that any storage charges accruing at the seaboard will be paid.

Precedent to the acceptance of commercial freight in carloads for export, there must be presented by the shipper to the railroad agent at point of origin a "G. O. C. permit" issued by the traffic control manager at port of export on application from the agent of the steamship line booking the cargo, or from representatives of foreign governments or from the United States Food Administration.

The prepayment of ocean charges to the inland carrier is not considered desirable by the United States Railroad Administration, particularly on shipments handled on a measurement basis. Decision on this matter the following instructions have been issued from the office of the Director, Division of Traffic, United States Railroad Administration, which are quoted for your information:

"Based upon conference with steamship lines interested in New York, August 13th, there is no objection to accepting prepayment of ocean charges in instances where shippers desire to prepay. There should be no complications so far as ocean charges on written contracts are concerned. There will, however, doubtless be some discrepancies on measurement cargo, and in such instances I have said to steamship lines that we would collect from shippers any undercharges that might occur on the steamship lines, we remitting the undercharges to steamship lines as quickly as collection has been made of same from shippers."

A. L. VILES, General Manager.

RAILROAD MOVEMENT OF LOADED AND EMPTY COAL CARS.

New York, September 8, 1919.

To the firm members of The Rubber Association of America, Inc.:

Our attention has been directed to the statements of various coal operators that the United States Railroad Administration has failed to provide adequate service for the transportation of coal.

With the thought that this office may be in a position to render some assistance to members who are finding it difficult to obtain coal, because of transportation conditions, we would appreciate very much advices respecting any transportation delay affecting the coal supply of any of our members.

It is quite necessary that this information shall be so well founded that it will be comparatively easy to substantiate any statement made it called upon to do so.

May we not hope for your early attention to this matter?

A. L. VILES, General Manager.

FEDERAL EXCISE TAX—TREASURY DECISION PLACING BURDEN OF ACCOUNTING FOR TAX ON MANUFACTURER WHO PURCHASES TIRES, INNER TUBES, PARTS OR ACCESSORIES FROM THE MANUFACTURER THEREOF.

New York, September 6, 1919.

To the firm members of The Rubber Association of America, Inc.:

The attached important Treasury Decision has just been issued by the Treasury Department and reverses previous rulings to the effect that where tires, inner tubes, parts or accessories are sold by the manufacturer thereof to a manufacturer or producer of automobile trucks, automobile wagons, other automobiles, motorcycles, tires, inner tubes, parts or accessories, and used by the latter either in the manufacture or production of new automobile trucks, automobile wagons, other automobiles, motorcycles, tires, inner tubes, parts or accessories, or for the sale of new automobile trucks, automobile wagons, other automobiles, tires, inner tubes, parts or accessories, the latter manufacturer or producer shall be deemed to have sold the tires, inner tubes, parts or accessories to the purchaser thereof, and pay the tax thereon to the Government.

It is noted that this decision applies for a revised form of certificate in lieu of the old so called manufacturer's certificate embodied in Treasury Department Circular No. 10, dated June 1, 1918, and dated June 5, 1919. The Association believes that it will be impossible to obtain this revised form of certificate covering past transac-

Under date of September 11, the Director of Traffic of the United States Railroad Administration advises that through export bills of lading should be issued on traffic destined to Central America, South America, Africa, East Indies including Straits Settlements, Australia or New Zealand.

tions, where the old form has been procured, but is, however, taking up this point with the Commissioner of Internal Revenue and will further advise soon.

A. L. VILES, General Manager.

A letter dated September 11, from the Association, states that the revised form of manufacturer's certificate embodied in Treasury Decision 2915 need not be obtained with reference to past sales. In other words, where the form of such certificate embodied in Treasury Decision 2852, has been obtained in the past, such old form of certificate is sufficient.

TREASURY DECISION 2915.

EXCISE TAX.

So much of the provisions of Article 14 of Regulations 47, Treasury Decisions 2872, 2860 and 2893, relating to the sale of tires, inner tubes, parts of accessories, to manufacturers or producers of auto-mobile trucks, automobiles, wagons, other automobiles, motorcycles, tires, inner tubes, parts and accessories, for sale without further manufacture, modified.

TREASURY DEPARTMENT,
Office of Commissioner of Internal Revenue,
Washington, D. C.

To Collectors of Internal Revenue and others concerned.
Article 14 of Regulations 47, entitled "Tires, inner tubes, parts and accessories sold to manufacturers," is hereby modified to read as follows:

Subdivision (3) of Section 900 of the Act exempt from tax, sales of tires, inner tubes, parts, or accessories to a manufacturer or producer of automobile trucks, automobile wagons, other automobiles, motorcycles, tires, inner tubes, parts or accessories, to the effect that the goods are exempted from the tax, the vendor must also at the time the goods are shipped or sold (whichever is prior) have in his possession an order or contract of sale, with certificate of the purchaser in writing, printed thereon or permanently attached thereto, to the effect that the purchaser is a manufacturer or producer of automobile trucks, automobile wagons, other automobiles, motorcycles, tires, inner tubes, parts or accessories; that he is purchasing the articles in question as such manufacturer or producer for resale in some form or manner, or for free replacement under contract or guaranty; and that he will account to the Internal Revenue Collector and pay the tax on the sale of such articles, unless such sales by him are made to another manufacturer or producer of automobile trucks, automobile wagons, other automobiles, motorcycles, tires, inner tubes, parts or accessories for resale by him in some form or manner, or for free replacement, in which case he will require the same form of certificate from such manufacturer or producer; that when such tires, inner tubes, parts or accessories are sold other than on, or in connection with, the sale of new automobile trucks, wagons, automobiles or motorcycles, he will pay the tax on such sales (unless made to a manufacturer or producer, or for free replacement under a contract or guaranty); that when such articles are sold on or in connection with the sale of such new vehicles he will pay the tax on the selling price of such vehicles, including such articles. Said manufacturers furnishing such certificate will be deemed manufacturers within the meaning of the law and subject to the tax imposed on sales of such articles by manufacturers, unless the sales are made to another manufacturer or producer of automobile trucks, automobile wagons, other automobiles, motorcycles, tires, inner tubes, parts or accessories, for resale by him in some form or manner, or for free replacement under a contract or guaranty, and who furnishes a certificate so stating. Following is a form of the certificate of statement which will be accepted and in substance must be strictly adhered to.

FORM OF CERTIFICATE.

The undersigned hereby certifies that he is a manufacturer or producer of automobile trucks, automobile wagons, other automobiles, motorcycles, tires, inner tubes, parts or accessories, and that the tires, inner tubes, parts or accessories purchased hereunder are purchased by him as such a manufacturer or producer for resale in some form or manner, or for free replacement under contract or guaranty, and agrees if any of the tires, inner tubes, parts or accessories are sold by him except from tax to another manufacturer or producer of automobile trucks, automobile wagons, other automobiles, motorcycles, tires, inner tubes, parts or accessories for like purpose, he will require a similar certificate from such manufacturer or producer. The undersigned further agrees that in respect to all tires, inner tubes, parts or accessories sold by him, unless such sale is made to such a manufacturer or producer, he will pay the tax on such sale direct to the Internal Revenue Collector, including in his tax return covering the month in which such sale is made; said tax to be paid on the basis of the taxpayer's selling price of such articles when sold other than on, or in connection with, the sale of new automobile trucks, automobile wagons, other automobiles, motorcycles, tires, inner tubes, parts or accessories, and on the selling price of such vehicles or articles when the same includes such articles.

If it is impracticable to furnish a certificate for each order, a certificate covering all orders between given dates (such period not to exceed a month) will be accepted. If in any case such an order and certificate cannot be produced on demand of any authorized agent of the Department, the tax in respect to the sale will be considered in default.

So much of the provisions of Regulations 47, Treasury Decisions 2852, 2860 and 2872, as relates to the sale of "tires, inner tubes, parts or accessories" is, in so far as they conflict herewith, hereby revoked.

J. H. CALLAN, Acting Commissioner of Internal Revenue.
Approved September 3, 1919.

CLARENCE GLASS, Secretary of the Treasury.

A letter dated September 13, from the Association, stated that the certificate outlined in Treasury Decision 2852 or 2915 will be accepted on sales between May 1 and August 31, 1919, but the certificate outlined in Treasury Decision 2915 must be used on sales on and after September 1, 1919.

NORTHWEST LAKE AND RAIL SHIPMENTS.

New York, September 12, 1919.

To the members of The Rubber Association of America, Inc.:
As a matter of information and to supplement your Traffic Department file, we are enclosing herewith a copy of circular issued by the Lakes Transit Corporation, setting forth the advantages of forwarding shipments to the Northwest via the rail and lake routes of that line as compared with the route via the Great Lakes.

In this connection we also call your attention to the fact that rates via rail and lake also include insurance while the shipments are on board boats of the lake line.

A. L. VILES, General Manager.

*Copy of this circular may be obtained from the Association.

THE FIFTH NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES.

THE FIFTH NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES was opened in Chicago, September 22, at the Coliseum and the First Regiment armory, and continued during the week. It is the most comprehensive exhibition of chemical and allied products that has ever been shown, making plain to the general public the great advance made by American chemists during the war years, especially in those lines in which Germany previously was preeminent.

Holding the exposition in the Middle West has stimulated interest and resulted in several professional associations holding their annual meetings in Chicago, to enable them to examine the display. Among these are the American Institute of Mining and Metallurgical Engineers, the American Electro-Chemical Society, the Technical Association of the Pulp and Paper Industry and the American Ceramic Society.

Many of the exhibitors naturally are connected with the rubber industries. We may note among them:

THE AMERICAN HARD RUBBER CO., New York City, with a display of hard rubber centrifugal and reciprocating pumps.

THE FOAMITE FIREFOAM CO., New York City, apparatus for fire protection in oil and chemical plants, including the automatic sprinkler.

WERNER & FLEIDERER CO., Saginaw, Michigan, rubber solution and cement mixers, rubber washers and mixing machines.

THE BRISTOL CO., Waterbury, Connecticut, pressure gauges, measuring and electrical instruments.

THE BUFFALO FOUNDRY & MACHINE CO., Buffalo, New York, vacuum dryers.

DAIGER & CO., Chicago, Illinois, laboratory supplies and new chemical products.

J. P. DEVINE CO., Buffalo, New York, vacuum dryers, kettles, pumps.

GENERAL ELECTRIC CO., Schenectady, New York, a model of precipitation outfit, motor with acid resisting insulation, other innovations and improvements in electrical machinery.

THE HUNTER DRY KILN CO., Indianapolis, Indiana, humidity dryer.

ANILINE AND CHEMICAL CO., New York City coal tar stuffs, intermediates and food colors. More than 200 distinct dyes of American manufacture.

NEW JERSEY ZINC CO., New York City, zinc products and other chemicals.

SCHAEFFER & BUDENBERG, Brooklyn, New York, pressure gauges, other recording instruments and testing apparatus.

C. J. TAGLIABUE MANUFACTURING CO., Brooklyn, New York, controllers and recording machinery.

TAYLOR INSTRUMENT CO., Rochester, New York, temperature and humidity measuring instruments.

WESTINGHOUSE ELECTRIC & MANUFACTURING CO., East Pittsburgh, Pennsylvania, electric apparatus applied to chemical industry.

BOYER OIL CO., New York City, seeds and nuts with the oil expressed from them, cake and meal.

J. H. DAY CO., Cincinnati, Ohio, mixing and grinding machines. INNIS, SPEIDEN & CO., New York, chemicals.

PRODUCT SALES CO., Baltimore, Maryland, glue, cement, chemicals, sporges, asbestos.

WHITALL TATUM CO., Philadelphia, Pennsylvania, chemical glassware and laboratory apparatus.

A SIMPLE METHOD RESORTED TO IN GERMANY FOR REMOVING PER-
ished rubber stoppers serviceable consists in turning off the hardened external portion in a lathe and finishing the surface with sandpaper. The hardened surface of a boring through the stopper is similarly removed by a round file.

Hevea Confusa in Singapore.

A TREE which has been determined as *Hevea confusa*, Hemsl., has been discovered in the Economic Garden of the Singapore Botanic Gardens and recently destroyed to prevent cross-pollination with seed-bearing *Hevea brasiliensis* trees nearby. I. H. Burkill gives a very complete botanical description of this species in "The Gardens' Bulletin, Straits Settlements," of July 4, 1919, accompanied by an excellent photograph.

The history of the tree was unrecorded, but its dark gray bark attracted attention; its foliage was seen to differ from that of *Hevea brasiliensis*, likewise its flower. The seeds were small, though not outside the extraordinarily wide limits in which *Hevea brasiliensis* varies. On tapping, the latex was found to be yellow, meager in amount, and to remain tacky, with little elasticity.

Dried flowering specimens sent to the Royal Botanic Gardens, Kew, were determined as *Hevea confusa*, Hemsl., by Sir David Prain. Samples of the rubber submitted to Dr. Frankland Dent, government analyst, Straits Settlements, and to B. J. Eaton, agricultural chemist in the Department of Agriculture, contained about 95 per cent of a substance chemically rubber, but lacking the physical properties required in commercial rubber, probably, Mr. Eaton suggests, a polymer of caoutchouc. Rather under two

acute, as in *Hevea brasiliensis*. The female flowers are a little smaller and the male flowers considerably smaller than those of *Hevea brasiliensis*, but a still more striking difference is the pose of the male flowers. The panicles are narrower than those of

HEVEA, HYBRID, TRINIDAD.

HEVEA CONFUSA, 1910, TRINIDAD BOTANIC GARDENS.

per cent of resins was contained. The tree yielded so grudgingly that the samples were too small for a vulcanization test.

Burkill describes *Hevea confusa* as belonging to the section of the genus which has the male flower buds blunt rather than

Hevea brasiliensis, as much because the angle at which the side axes take off is smaller, as because they are of lesser size. The weakest panicles are wholly male, as in *Hevea brasiliensis*, and the stronger carry more and more female flowers upon the lower side branches up to 5 or 6. The perianth lobes are ovate and blunt, and the cup extends to half their length; they and the cup are straw colored with a magenta line down the middle from the tip or near it to the very base inside. Outside they are covered with short hair. The top of the ovary is conspicuously blunt with sessile stigmas. The male flowers are blunter than those of *Hevea brasiliensis*, straw-colored, have fewer anthers, and by the bending of their pedicels they face more or less earthwards. Outside they are hairy. This bending of the pedicels gives a very good distinguishing mark which the herbarium student cannot note so well as the field student.

Hevea confusa originates from British Guiana. It differs as little from *Hevea pauciflora*, Muell. Arg., of the same region, that to unite the two on botanical eye characters is quite justified, and it is not surprising that with only the seeds as a guide Dr. P. J. Cramer suggested *Hevea pauciflora* as the species. *Hevea pauciflora* is known to produce hybrids of no apparent value with *Hevea brasiliensis*, and that the same is true of *Hevea confusa* is shown by the experience of planters in Trinidad.

During the winter of 1911-1912 the Editor of THE INDIA RUBBER WORLD visited a plantation owned by Boston rubber manufacturers, where many *confusa* hybrids were found among true *Hevea brasiliensis*. The source of the seed from which these trees grew was a fine thirty-year *Hevea brasiliensis* of undoubted purity, growing in the Botanic Gardens of Port of Spain. About one hundred feet from it was an equally large and thrifty *Hevea confusa*. The theory, therefore, is that bees visiting the flowers of *Hevea confusa* conveyed pollen to the flowers of the *Hevea brasiliensis*, and thus were responsible for the creation of a troublesome mongrel. That it was discovered while planting

was still young in the western world is most fortunate, and Mr. Burkill deserves a vote of thanks from all *Hevea* planters for being so keenly alive to the importance of keeping this species and its hybrids out of the plantations of the Middle and Far East.

As found in Trinidad, the *Hevea* hybrids were of lusty growth, full-branched and densely leaved. The leaves were much broader toward the point than those of *Hevea brasiliensis*, the leaves of hybrid seedlings standing out from the stem almost horizontally and those of *Hevea brasiliensis* hanging almost vertically. The bark was of dark reddish color rather than of the usual silvery appearance, and hardly more than an eighth of an inch in thickness. The surface of the outer bark was broken by many minute spines; whereas, the bark of *Hevea brasiliensis*, although nearly smooth, shows tiny vertical ridges. The latex produced a rubber that was very short and far inferior to fine Pará. After the latex had ceased flowing, a yellow-green resin oozed out and rolled down over the bark and there remained as sticky as the surface of fly-paper.

CAPTAIN BUCKLETON VISITS GERMAN RUBBER FACTORIES.

CAPTAIN ERNEST E. BUCKLETON, president of the Northwestern Rubber Co., Limited, Liverpool, England, has recently returned from an extensive tour of the leading rubber factories of Germany. He was the first business man from an Allied country to visit Germany after the armistice was signed, and of course the first in the rubber industry. The trip was exceedingly interesting in that it gave him a good opportunity to learn from the heads of the largest concerns the condition of the German rubber industry during the war and at present.

Regarding his findings Captain Buckleton writes as follows:

I found that all of the factories were working at fullest capacity, the government favoring small factories which, up to the starting of the war, were in very low water, but in the past five years have improved their condition. In fact, all of them have made considerable money and relatively are in a very sound position.

During the period of the war, the manufacturers of Germany did not suffer to any great extent from want of fabrics, the government having absolute control of this material and apportioning it out to the industries where it was most needed. What they suffered from mostly was want of crude rubber and oils, as their stocks, when war was declared, were very low. Prohibitive prices, as high as \$7.50 per pound were paid for crude rubber, when it could be found. A substitute made from coal and chalk was produced by the Elberfeld Co. and marketed as "synthetic rubber," the price of this material averaging about \$3.60 per pound.

The use of reclaimed rubber during the war was considerably increased, and the product turned out was very good, the price, however, being very high.

The working conditions in the factories, from what I could learn, were about the same as in all other Allied countries in Europe during the war period, and the conditions today about the same. The average mill man earns about 55 to 60 cents per hour, but the output is only roughly three-quarters of normal.

The highest prices paid for various materials in Germany during the war period are as follows:

ARTICLE.	DATE.	PRICE PER P. LB.
Aniline	February, 1915	\$1.52
Caustic soda	July, 1915	4.26
Ammonia solution	October, 1918	2.49
Caustic soda lye	June, 1919	2.46
Caustic potash lye	December, 1918	2.49
White lead	March, 1917	7.22
Litharge	September, 1917	4.79
Natural gummi	May, 1919	1.21
Benzol	July, 1919	1.33
Cylinder oil	April, 1916	4.23
Alcohol of sulphur	July, 1915	8.62
Cresol	July, 1917	8.62
Bleaching powder	June, 1919	2.21
Rosin	August, 1915	2.74
Resin	February, 1916	2.74
Calcium carbide	May, 1915	3.16
Brown faetice, best	July, 1919	1.19
Brown faetice, ordinary	March, 1919	1.12
Prime ray seed oil factory	April, 1917	1.31
Crushed substitutes	February, 1916	1.27
Flake graphite	October, 1918	1.64
Gypsum	May, 1915	2.79
Gradum	April, 1915	8.74

Sulphuric acid	November, 1919	1.15
Sulphuric acid	November, 1914	1.15
Talc	March, 1917	1.15
Tar	May, 1914	1.15
Carbon black	May, 1914	1.15
Carbon black	June, 1919	2.86
Cumhar	July, 1915	8.18
Zinc dust	February, 1918	1.36

CAPTAIN ERNEST E. BUCKLETON.

EXPORT CONCERN TO DEVELOP SOUTH AMERICAN TRADE.

The Namusa South American Co., with temporary offices at 30 Church street, New York City, has been organized by a group of manufacturing concerns in the United States for the development and maintenance of export trade under the Webb-Pomerene Act. The plan under which the corporation will operate is sponsored by the National Association of Manufacturers.

ELECTRIC HOT-PLATE.

The Hoskins electric hot-plate for laboratory use has a heating element of the three-heat type made of chromel wire, producing 475, 600 and 750 degrees F. The heating unit is composed of three parallel windings of chromel wire which can be very easily renewed. It operates on 110 or 220 volts, alternating or direct current. (Hoskins Co., Detroit, Mich.)

THREE-HEAT TYPE PLATE.

Holmes Brothers, makers of rubber machinery, have moved to 440 North Sacramento Boulevard, Chicago, Illinois.

The Rubber Trade in Great Britain.

By Our Regular Correspondent.

THE ECONOMIC PROBLEMS arising from the external debts contracted by all the countries recently at war—leaving America out of consideration—have come somewhat as a shock to those who had not anticipated anything of the sort. In the case of raw rubber the idea was that the European countries would send rush orders for large quantities and that the price would jump. The reality is that there is very little money anywhere to pay for imports and the arrangement made whereby long credits are allowed to the new states by the British Government is not considered an ideal one by the taxpayer who will have to shoulder any losses that accrue.

The fact that all import restrictions were removed on September 1 is not hailed with glee by manufacturers generally, despite the precautions which are to be taken to prevent the dumping of goods from a foreign land at a cost which is beneath the price at which they are sold in their own country. Those who wanted a tariff on all imported goods which are being made in this country are especially dissatisfied, though the consumer, of course, looks at things in a different light. At the time of writing it is too soon to say how the protection to be afforded to "key industries" will affect the rubber trade but it will not be a matter of great concern because, except in a few articles, we have always been an exporting rather than an importing nation in rubber goods. With regard to the profiteering bill, we may expect to see some reduced prices in the retail shops, especially in country districts and at the seaside where a good deal of profiteering has been going on in rubber goods.

A prominent proofing firm tells me that as regards its production probably the annual import of goods does not exceed £1,000, so there is nothing to fear from foreign competition. On the subject generally he expressed himself as in favor of competition as being conducive to progress. Makers of sand shoes and gymnastic shoes who have had in the past a good deal of competition from America and Germany, are wondering what Germany will do in the way of exporting on the removal of restrictions. Their goods were cheaper than ours, but not better, while as regards goloshes, it is reluctantly recognized that we are still in the position of having to meet a better article, if public preference is a safe guide.

NAPHTHA STORAGE.

Developments of some interest are now taking place in regard to this matter, which is closely connected with the storage of petrol and benzol in motor garages. In small rubber works it has been customary for the solvent naphtha to be drawn direct from the cask or drum as required, thus often leading to the inclusion of some water and sediment. In the larger works cast iron longitudinal tanks are used, capable of holding many thousands of gallons. These tanks have riveted covers and a sloping bottom where the water and sediment collect. A float attached to an index scale shows the volume of solvent in the tank at any time. The naphtha is either drawn off by a cock above the water line by hand or is pumped to the dough-mixing rooms. In this system there is a certain, though only small loss by evaporation and the tank contains an explosive mixture of air and vapor. At least this is what is generally stated, though I should have thought that the amount of vapor present would have been above the explosive limit. I have never heard of the explosion of a naphtha tank due to the ignition of this explosive atmosphere by lightning, though it is spoken of as possible. In the Bywater system of hydraulic storage the method adopted is to displace the liquid in storage by water, thus leaving no space for evaporation. No pumps are used, labor costs being thus reduced to a minimum as the water does all the work.

Briefly stated, the hydraulic system consists of a steel tank in

which the liquid is stored. On delivery into the tank the liquid displaces a like quantity of water, which, being registered through a meter, measures the volume of solvent entering the tank. On the solvent being drawn off through another meter the water reenters the tank, to take its place. Plans have been worked out for utilizing the system in proofing factories, the naphtha being raised to the necessary level and run by piping to the several floors, a meter being fixed at each point of delivery, thus checking the exact amount taken by each machine. Although the hydraulic system has been adopted mainly for the storage of petrol for motor purposes, it has also been installed by two of our largest proofing works, the capacities being 10,000 gallons and 6,000 gallons. As the storage tank is usually sunk into the ground there is no tendency to float on swampy ground as it is always full of liquid.

Reverting to what I said about not having heard of the explosion of a naphtha storage tank, it may be of interest to say a word in regard to what appeared in the papers recently. This was to the effect that a certain casualty was due to the explosion of a naphtha tank at the rubber works of I. Frankenburg & Sons, Limited, of Greengate, Manchester. In reality this was not the explosion of a storage tank. The tank in question was a small service tank in one of the spreading rooms, the naphtha in which got alight from some unascertained cause, possibly the bursting of an electric light globe.

NEW WORKS.

Potter's Asbestos Co., Limited, Littleborough, Lancashire, is about to build a rubber works which will give employment to 1,000 hands. A housing scheme is to be put in hand by the local district council in order to provide for the influx of work people. Littleborough is only a few miles away from Rochdale, where the important asbestos plant of Turner Bros. is situated, and there is no regular rubber works in the district.

It is understood that Redfern's Rubber Works, Limited, Hyde, near Manchester, has decided to erect a new factory at Crewe, the well known railway center of the London & North Western Co.

The Standard Tyre and Rubber Manufacturers, Limited, has been formed with a capital of £125,000, to take over the rubber manufacturing business carried on at Alpertons Mills, Wembley, near London.

The British Westinghouse Co., located in Trafford Park, Manchester, is to be known in the future as the Vickers Electrical Co., Limited. It was reported recently that Vickers, Limited, had obtained a controlling interest in Glovers Cable Works, situated only a few hundred yards from the Westinghouse works.

MAGNESIA.

In the course of one or two legal actions regarding the sale of magnesium carbonate, it was made evident by the varying statements of experts that there is still a good deal to be found out about the molecular constitution of the basic magnesium carbonate, so largely used in the rubber trade. Judging from the remarks of some chemists and their constant reference to the Pharmacopia, it seems that the large tonnage used in the rubber trade is not generally recognized and it is no doubt correct to say that no other industry uses it on a like scale. Outside purely legal questions as to the validity of contracts there has been a good deal of evidence given as to the difference between light and heavy carbonate of magnesium and also as to the presence of certain impurities, such as sulphate of soda. Despite the fact that analyses may show practically identical figures in the case of light and heavy, it requires very special pleading on the part of counsel to contend that they are the

same thing when the volumes occupied by the same weight of each are compared.

To the best of my knowledge rubber manufacturers who buy light carbonate of magnesia lay far more stress upon the lightness than upon any other attribute. Indeed, I doubt if any of them ever think about the degree of hydration or the linking of the hydroxyl groups. An eminent counsel declared that there must be some point at which light magnesia merges into heavy and that in the care of such a product it would be impossible to specify or identify it as light or heavy. Scientific evidence, however, has been given that light and heavy have different and distinct characteristics and that there is no such thing in commerce as a half and half product. It occurs to me here that there would be no difficulty in making up a mixture of the two if there was any demand for it and a dispute on a product of this sort would be a thorny matter to tackle.

With regard to the presence of sulphate of soda in magnesia made by the precipitation process, I do not know that there are any permissible limits recognized in the British rubber trade. This probably arises from the fact that attention has not been called to the point owing to the great bulk of the magnesia used in pre-war days being the product of a special process in which sulphates are not employed.

As to the use of the light and heavy in the rubber trade for bulk compounding, evidence goes to show that the light is almost generally employed whereas the heavy has but few adherents. Whether this preference is based on solid grounds is a matter which does not call for detailed discussion here. With respect to the use of small amounts as an accelerating agent I believe the general opinion is that the two work equally well.

It is interesting to note that a natural basic carbonate of magnesia having the same chemical composition as the manufactured article has been found in places in Canada and I believe that a consignment has been shipped to England.

Normal carbonate of magnesia, or magnesite, is, of course, comparatively common in the world and in the finely ground state it is said to be used to some extent in the rubber trade. As there is no recognized standard for light and heavy basic carbonate of magnesia, and as some makes of light are heavier than other makes of light, it certainly seems desirable that all contracts or rates should be by sample so as to obviate the possibility of disputes on delivery.

THE RUBBER TRUSTS' HEAVY LOSS.

The report of the Rubber Plantations Investment Trust explains why the shareholders will have no dividend for the second year in succession, though it indicates that a better result may be expected for the present year. The balance at the end of March, 1918, was £119,375, the whole of which was carried forward. In 1918-1919 there was a net loss on the produce from the company's estates of £106,020, reducing the balance to 3,300, which naturally does not permit the payment of a dividend. The report contains the cheering assurance that the adverse war conditions have now been largely removed and that the intrinsic value of the trusts' investments, both in shares and properties, has largely appreciated—a valuation of the investments in shares, debentures, and options made at the end of last March, shows a surplus of £4,289,927 over the £815,647 at which they stand in the balance sheet. In 1910-11 the dividend paid was 15 per cent.

Miscellaneous Foreign Notes.

FEDERATION OF BRITISH INDUSTRIES INCLUDING RUBBER.

THE Federation of British Industries comprises 172 associations and 956 individual firms, representing upward of 17,000 British manufacturing establishments. A plan of organization has been outlined under which the various industries are divided into 17 groups.

The rubber industry is placed under group 13, which consists of rubber, asbestos, leather and allied trades. The following list of sections in the group will make the system more clear:

Group 13. Rubber, asbestos, leather, and allied trades:

- Subgroup 1. Rubber Manufacture—
 - (a) General rubber trade.
 - (b) Tire trade.
 - (c) Proofing and garment making.
- 2. Leather production—
 - (a) Carriers and light leather manufacture.
 - (b) Tanning and heavy leather manufacture.
- 3. Leather-goods manufacture—
 - (a) Saddlery and harness.
 - (b) Boot and shoe manufacture.
 - (c) Leather belting.
 - (d) Bags and fancy goods.
 - (e) Balata belting.
- 4. Asbestos manufacture—
 - (a) Textiles, etc.
 - (b) Asbestos cement (building materials).

C. D. LLOYD RETIRES FROM THE VICTORIA RUBBER CO.

C. D. Lloyd, for 35 years with The Victoria Rubber Co., Limited, Edinburgh, Scotland, was presented with a gold watch and purse of Treasury notes from the staff and employees on August 14, 1919, when he retired. J. E. Baber, manager of the works, made the presentation speech in the absence of P. M. Mathew, managing director, commenting on the fact that a number of other members of the staff have been 30 years or more with the company, and emphasizing the spirit of cooperation in the past between the company and its employees as the ideal to be especially striven for in industry at the present time.

DISTINGUISHED SERVICE MEDAL FOR CAPTAIN ALCAN.

Captain Adrien Alcan, a partner in the firm of Alcan & Co., rubber merchants of Paris, France, associated with Hecht, Lewis & Kahn, London, England, who for two years has been attached to American Army Headquarters in France, was recently awarded the Distinguished Service Medal by General Pershing in the name of the Government of the United States, with the following text:

While on duty with the French Military Mission at General Headquarters, American Expeditionary Forces, he rendered services of exceptional value to the United States Army. His ability, tact, loyalty, and untiring efforts proved of inestimable assistance in the successful execution of many important negotiations with the French Army. He went far beyond the bounds of duty to help the American Expeditionary Forces, proving himself a willing and devoted friend to their interests.

SOCIETE INTERNATIONALE DE PLANTATIONS ET DE FINANCE.

The *Société Internationale de Plantations et de Finance*, a joint stock company with 25 million francs capital, aims to promote the plantation industry, especially the culture of rubber, olive trees, tea and coffee, in the various European Colonies in Asia, and the financing and administration of the plantations already in existence or those to be established.

Various well-known persons in financial and plantation circles in Belgium, The Netherlands, France, England and Switzerland are members of the board of directors. For the Netherlands they are the Messrs. J. F. van Tienhoven, K. P. van der Mandele, C. J. den Tex Bondt, O. F. Weise and A. G. N. Swart, the latter as a member of the Committee of Direction. The main office is at Antwerp, Belgium, and a branch office will be opened at 's-Gravenhage (The Hague), Holland, while in Sumatra, Medan, the Federated Malay States agencies are being established.

A DANISH CABLE FACTORY.

Early in the war Denmark decided to make its own cables and the *A. S. Den Danske Kabelfabrik* was formed in the fall of 1916, exclusively with Danish capital. By the end of 1917 the buildings were ready at Fredericksbolm Haven, Copenhagen, and work was begun in the wire-drawing mills. However, machinery ordered in America was held back, so Danish engineers were employed to exercise their ingenuity in constructing the necessary machinery, which is said to be satisfactory.

RUBBER IMPORTS AND EXPORTS.

Official statistics show Danish rubber imports and exports for the following years to be:

	Imports.			Exports.		
	1913.	1917.	1918.	1913.	1917.	1918.
Crude	253,066	289,280	22,080
Manufactured	2,227,720	1,107,920	135,080	168,960

AKRON TIRES IN AUSTRALIA.

Charles Duval, manager of tire sales for The B. F. Goodrich Co. in Australia, states that 65 per cent of the tires used on automobiles in that continent come from Akron factories, and believes that the market for American tires and rubber goods will materially increase in Australia in a few years. Motoring is much more expensive there than in America, gasoline averaging 85 cents per gallon and automobiles costing approximately twice as much as in the United States.

COOPERATION OF JAPANESE RUBBER COMPANIES.

A further development of Japan's increasing rubber trade is looked for through a combination of large and small rubber factories in and near Tokyo that is said to portend amalgamation at an early date so as to put the Japanese rubber manufacturing industry on a firm foundation. This was brought about by the receipt of large orders for rubber tubing and sheeting from the new Siberian Government that the Okuragumi has distributed among the Mitado, Toyo, Nippon and Meiji companies, regarded as having the best rubber works aside from foreign enterprises in Japan. This form of co-operation, involving the exchange of orders and stocks, has been decided upon to secure efficiency and economy, and to avoid unnecessary competition among local firms.

ANALYSIS OF ITALIAN RUBBER TRADE.

ITALY'S TRADE in rubber and rubber manufactures in 1913 amounted to \$11,543,217 in imports and to \$9,861,147 in exports. Of the former amount, imports of crude rubber accounted for \$4,940,549 and of tires for \$4,393,742. Tires were the largest item of exports, being valued at \$7,927,379. The imports in 1917 were valued at \$17,523,941, raw rubber accounting for \$13,008,046, and tires for \$2,130,257. Exports for that year were valued at \$6,541,938, tires, the chief item, amounting to \$4,829,323, and raw rubber to \$299,787. In 1918 the value of the imports increased to \$19,805,933—raw rubber being valued at \$16,019,097, and tires at \$1,050,885—and the exports decreased to \$3,150,291—tires being valued at \$2,090,248.

The Italian trade in rubber, gutta percha, and manufactures thereof is very small, the normal consumption within the country being about 2,000 tons per year outside of imported rubber overshoes. Practically all the raw material brought in is used by one company whose name is almost synonymous with rubber tires. Several other firms, however, manufacture rubber goods. Exports of tires have exceeded imports for some years, being, in 1913, 3,012 tons; in 1914, 4,114 tons; in 1915, 4,361 tons; in 1916, 3,778 tons; in 1917, 2,117 tons; and in 1918, 916 tons. Of the 1913 exports, which can be taken as representing normal con-

ditions, 888 tons went to Belgium, 587 to Switzerland, 403 to Great Britain, 352 to Germany, 270 to Austria-Hungary, 134 to Argentina, 97 to France, and 64 tons to Australia. The largest customers for Italian rubber goods outside of tires, particularly for small tubes and elastic, were Argentina, Brazil, Cuba and Uruguay, which, with other Latin American countries, probably took two-thirds of all exports. Most owners of good automobiles prefer imported tires, which they consider superior to those of Italian manufacture. The market is not, however, extensive, as the number of cars is small.

The importation of rubber overshoes, which particularly interest American manufacturers, who have had control of this market for many years, shows a decided tendency to decrease. Imports in 1908 amounted to 135,856 pairs; in 1909, to 159,168; in 1910, to 173,747; in 1911, to 201,824; in 1912, to 121,565; and in 1913, to 43,588 pairs. The present fashion of women wearing high-heeled slippers or low shoes for street wear in winter makes the use of rubber overshoes, except sandals, impracticable. Efforts should be made to encourage the trade in an overshoe designed for such wear.—("Commerce Reports.")

NEW PIRELLI MANAGERS.

Pirelli & Co., of Milan, Italy, announce that the following have been added to the personnel of the board of management, any two of whom together may sign for the firm: Federico Artom, Rizzieri Campiglio, Luigi Crosio, Dr. Mario Lubatto and Giuseppe Venosta. These are in addition to Roberto Comelli, Carlo Frattino, Fabio Palandre and Lorenzo Ramelli, who were already on the board.

RUBBER GOODS REQUIRED BY ITALY.

Among the various goods required by Italian merchants who desire to sell on a commission basis are crude rubber, rubber shoes, rubber heels, fountain pens, etc.

American manufacturers who contemplate entering the Italian market should send samples either to a forwarding agent or to the American Chamber of Commerce in Milan. If notified where samples may be inspected, this consulate will gladly forward such information to interested parties in its district (Lombardy).

Other suggestions are: (1) Catalogs and correspondence should be in Italian or French. (2) When possible, price should be quoted c. i. f. Genoa, in Italian lire and metric measurements. (3) When quotations are f. o. b. American ports, there should be added the exact freight rate to Italian ports, in order that the prospective purchaser may know how much the goods will cost him delivered in Italy.

RUBBER EXPORTS FROM THE NETHERLANDS.

The *Vereniging voor den Rubberhandel* (Society for the Rubber Trade) at Rotterdam, Holland, has forwarded a despatch to the Minister of Agriculture, Industry and Commerce, urging the removal of the export prohibition on crude rubber. Now that imports are free and there are no difficulties in obtaining crude rubber, it is in the interest of the plantation companies, and also for the restoration of the staple market, that rubber exports should be free.

AMERICAN VESSELS CARRYING CRUDE RUBBER TO THE EAST INDIES.

The interest now being manifested in the development of the trade between America and Java is shown by the fact that two large American cargo vessels recently sailed from Soerabaya on the same day, after discharging general cargo from America. One of these vessels is carrying direct to New York via the Suez Canal a full cargo, including crude rubber from Soerabaya, Samarang and Batavia.

A Rubber Letter from Germany.

From a Well-Known German Technologist

THE WAR with its horrors is over, a new period of peace has begun. The campaign on the border came to an end as early as November, but the political and economic strife in the interior continues with undiminished energy even to-day. When will the real resurrection from the frightful cataclysm come about? Let us only hope that a dam may be built against the Bolshevik flood, that all-destroying terror which is far too greatly underestimated by you over there, but is far more dangerously menacing than you apparently think.

As a token of the difficult conditions with which the German rubber industry had to wrestle during the war the words "no crude rubber" will suffice. That tells the whole story. And while they succeeded during the period of the war in supplying the German textile factories with great quantities of domestic fibers for the most varied purposes, such substitutes were cut

	Dividends, Per Cent

The prospects of the German rubber industry in the current business year are looked upon naturally with skepticism, for to-day there is lack not only of crude rubber, but also of oil and coal as well as other working materials. The loss of the world war and the upset it involves have hit hard the German rubber industry also, and no one can tell what is going to happen, for the factors on which the coming development depends are too many—the phantom of socializing business, continuous unrest, steady wages agitation and strikes, labor demands that cannot be granted, business expenses, payments and

FACTORY OF THE HANNOVERSCHE GUMMI-KAMM COMPAGNIE, A. G.

off from the rubber industry. Certainly we must not forget to mention that the preparation of artificial rubber was undertaken on a large scale during the war, and considerable quantities of this synthetic rubber were worked up by the rubber factories. It should be made clear in America that the veil which for a long time was wrapped about the creation of artificial rubber has been lifted. It is certain that the artificial rubber has done good service to Germany during the war years. Now it has again sunk out of sight, at any rate for the immediate future, since the German rubber goods factories are declining to take further quantities of synthetic rubber the moment sufficient quantities of the natural product are imported. As to what will become of the great works built to manufacture the artificial rubber, no light as yet has penetrated the darkness that covers the riddle.

I have before me a number of commercial reports of German rubber factories for the working year 1917-18. We find from these that the factories, in spite of the deficiency in crude rubber and the enormous difficulty of procuring other necessary raw material and stuff to work, were kept fully busy with the manufacture of the articles needed by the army administration and for economy purposes, and in general were not cut down seriously. It must be taken into consideration, however, that these figures show hardly or not at all the effects of the revolution in the last account. Following are the latest dividends paid by a series of standard enterprises:

taxes that have risen enormously, the cessation of exports and the importation of manufactured goods from foreign lands, the inability to compete and the speculation in the markets of the world. All these things press down upon business measures and circumstances call for an entirely new internal and external organization.

The Continental Rubber Co., Hanover, expresses the following opinion regarding the future: "We most seriously fear that we shall not be capable of competing in the world markets, and that even at home as soon as our boundaries are opened, we shall hardly be in a position to protect ourselves against foreign competition. However, it rests with us Germans ourselves how we lay out the future. We need quiet imperatively. If lasting peace returns to us, then we may well hope that raw materials will not be withheld and that with them labor will be provided for, because work, the hardest, most strenuous kind of work, is necessary if we are to recover and not go to destruction."

A few days ago the importation of crude rubber was permitted and thereby a "first pebble of resistance" was moved out of the way. The important question remains open, however. When shall we receive sufficient quantities to enable us to get manufactures into full swing? We know that there is a clear overproduction of plantation rubber, that therefore great supplies are to be had at low prices. How is it, however, with transportation to European markets? The war has brought about a complete change in the rubber market. We are, in the first place, still wholly dependent on London. And here we come to a point that interests in an unusually high degree the German circles that are concerned; it is the development of the American rubber and automobile industry, the investment of

American capital in East Asiatic rubber plantations and all that that implies. What America has accomplished in this line is really astounding, and the manner in which she has managed to utilize the war conditions that were favorable for this. Germany may, perhaps, be the chief sufferer, but the fact remains that it admires what America has been able to accomplish.

We have lost our colonies, can no more raise our own rubber; our manufacturers have neglected to invest large amounts of capital in the East Asian rubber plantation form of agriculture, and our Hamburg crude rubber market, erected only a little while before the war, is ruined.

As to the future of our market in Hamburg, that is obscure. May the words of M. A. Ritter receive the attention which

VEREINIGTE BERLIN-FRANKFURTER GUMMIWAREN FABRIKEN
(GELNHAUSEN WORKS).

they deserve from the circles that are interested. Ritter offers an answer to the question—how and in what way it may be possible to create soon in Hamburg an adequate rubber market that shall be in keeping with the importance of our rubber manufacturing industry.

He comes to the conclusion that the erection and maintenance of an independent plantation rubber market of the first rank in Hamburg, with all the great advantages it offers, can very well be carried out if a strict organization is established and the necessary measures are taken, that were essential in the creation of the foreign competitive markets (especially in London). Among the requisite measures and arrangements of which the aforesaid treats, the following may be mentioned briefly:

1. Equalization of freight charges for plantation rubber from the Eastern ports direct to Hamburg (a measure to be taken later).
2. Storage in the rubber associations' storage warehouses; uniform certificates of weight and storage receipts; uniform and regulated furnishing of samples, etc.
3. Requisition of uniform contract rules which shall at all times be fair to the interests of importers, brokers and dealers.
4. No private book sales, but public sales of definite, incoming, consigned lots, outside of free traffic.
5. Development of the rubber futures market.
6. Appointment of a committee of experts, which shall undertake the prompt and technical settlement of all differences of opinion.
7. Promotion of direct trade between the rubber plantation districts and Hamburg through the activity of German rubber traders and the financing of crude products exportation to Hamburg by German banking institutions, especially in Dutch India.

Ritter wishes through his appeal to call the attention of the persons concerned to this matter, of unusual importance for German economic life, by showing that it must be our endeavor to attain what the United States has already won during the war, namely, independence of middlemen and elimination of the circuitous way through London.

We can only wish that the sensible and certainly feasible ideas of Mr. Ritter may fall on fruitful soil and may also be sufficiently understood by the commercial class in Hamburg itself. It seems as though the pleas had really aroused interest here. The Hamburg crude rubber dealers are fighting energetically against the contemplated establishment by the Imperial Ministry of Commerce of a rubber and asbestos industry trust. They declare that the inclusion of the rubber trade in the rubber and asbestos trust and the establishment of a foreign trade office is wholly impractical for rubber importation and is uneconomical since the supply and the trading would be subject to the costs of this organization and consequently the price of raw materials would be needlessly increased for the German consumer. Importation into free ports, intermediate trading with foreign lands, and dealings in the goods lying in free ports must be kept free from any centralizing regulation; otherwise, the business of the Hamburg market, including the business in futures, would be driven to the competitive markets like Rotterdam, Antwerp, Liverpool, London, etc.

The old order is destroyed, the new must stand on firm foundations. When will all the clouds which surround the future of the German rubber industry be driven away?

GERMANY'S RUBBER REQUIREMENTS.

Among the raw materials which Germany desires the allied and associated governments to furnish, and regarding which inquiry as to quality, quantity and price has been made of the Committee on Minutes of Reparation Commission in Paris, is a monthly supply of 2,500 tons of raw rubber. This indicates a contemplated annual consumption of 30,000 tons, or nearly double what it was before the war.

SWEDEN CONTINUES RESTRICTION OF RUBBER EXPORTS.

Sweden still forbids the exportation, except when properly licensed, of: rubber, gutta percha, balata, reclaimed rubber, rubber thread; solid rubber tires, even if in lengths; inner tubes and outer covers and parts thereof, even when in combination with other materials for cycles and motor cars; rubber boots and shoes and rubber waste and scrap. Likewise: cycles and motorcycles with rubber tires fitted; carriages, vehicles and frames, without motors but with rubber tires; carriages, vehicles and frames, including airplanes and airships, with motors and the wheels with rubber tires for such carriages. Cycles, motorcycles, motor cars, airplanes and airships, however, may be exported if they had been imported into Sweden for the owner's own use, while travelers leaving the country may take such vehicles with them, provided they agree to reimport them into Sweden.

ENGINEERING CONGRESS AND INDUSTRIAL EXHIBITION IN JAVA.

A congress to which engineers from all countries touching the Pacific are invited, will be held at Weltevreden, near Batavia, Java, May 8 to 15, 1920, under the patronage of the Governor-General, at which over 170 papers on engineering problems in Asiatic countries will be presented. Among them will be several discussing the production of rubber.

Following the congress an industrial exhibition will be held at Bandoeng, which, while primarily intended to stimulate domestic industries, will give manufacturers of tools, machinery, bicycles and motorcycles, an opportunity to exploit their products. American houses must be represented by a Java firm in order to exhibit. A list of machinery houses in Java will be available for those who are interested.

Further information can be obtained by addressing B. J. Krol, secretary of the Netherlands Indies Industries Fair, 39 Oostende, Bandoeng, Java.

Applications for participation in the congress should be sent to the Secretary, Molenvleit East 3, Weltevreden, Java, who will arrange for hotel accommodations and trips.

Rubber Planting Notes.

A NEW BRAZILIAN TAPPING KNIFE.

IN the face of the rivalry of the East Indian plantations the more intelligent Brazilian rubber men have not gone to sleep. The study of improvements in cultivation, in gathering the crop and in preparing the latex has been going on for some years at *Seringal Miry*, the experiment station at Manáos. One result of this activity is the invention of the Amazonia tapping knife, by José Claudio de Mesquita, president of the *Club da Seringueira*.

("A Seringueira.")

THE AMAZONIA TAPPING KNIFE.

guêira, to be used for the purpose of doing the least possible damage to the trees.

Referring to the figures in the illustration, blade 1 cuts a channel in the bark with an inclination of 45 degrees, the depth of which is barely sufficient to let the latex run without overflowing the incisions made by blade 2 in the interior wall of the channels. The movable key 3 is provided with guide 4 that regulates the direction and depth of the cut, while the part 5 removes the pieces of bark from the curved blade. The key 6 is held between the thumb and the forefinger, and is moved or held in place, according to the service required of parts 4 and 5.

("A Seringueira.")

METHOD OF TAPPING AT SERINGAL MIRY.

Preliminary to tapping at *Seringal Miry* it is customary to mark off the circumference of trees, which must be at least $\frac{3}{4}$ -meter in girth three feet above the ground, into three longitudinal sections, each one of which in succession is to be tapped for two years, in order to return to the starting point in seven

years. When the tree is more than a meter in girth, as shown in the picture, each of the three sections is divided into two or more equal portions of twenty to thirty centimeters each for tapping purposes.

POSITION OF PARÁ RUBBER.

Trade in Pará for the quarter ended with June was extremely depressed because the very low price of rubber was aggravated by a rise in exchange Pará, while the Amazon valley is passing through a crisis; it is impossible to produce rubber under the conditions prevailing in Brazil so as to compete with the best Eastern plantation rubber when it sells for 40 cents a pound. The fiscal year, July, 1918, to June, 1919, has been a poor one for rubber, the receipts being only 31,400 tons, as compared with 35,000 in 1917-1918 and 37,600 tons in 1916-1917; it is the smallest crop since 1903-1904 when the receipts were 30,390 tons. There has been a steady decrease in island rubber with an increase in the upriver production. The exports for the year were 13,265 tons to the United States, and 4,924 tons to Europe, while the exports for the first six months of 1919 were 19,492 tons to the United States and 7,532 tons to Europe. However, not all of this was sold—"Board of Trade Journal."

RUBBER SEED OIL WASTE AMOUNTS TO \$8,500,000.

It is estimated that on the rubber plantations of the East some 300 pounds of rubber seeds per acre fall to the ground and are allowed to rot, despite the \$8.50 worth of valuable oil extractable from them and the various uses to which the husks and meal might be put. A further computation of this waste is interesting.

Of the 2,000,000 acres now embraced by Eastern rubber estates some 1,000,000 acres are now in bearing. This means that 150,000 tons of dried rubber seed kernels, go to waste annually. From these kernels 42 per cent of oil is extractable. In other words, 15,750 tons of oil worth \$540 per ton and aggregating \$8,500,000 are being wasted annually. For most purposes rubber seed oil is a very good substitute for linseed oil now selling at some \$650 per ton, and has several times brought about five-sixths the price of the better oil. The cost of collecting and decorticating the seeds, packing and shipping the kernels to England is estimated at \$50 a ton.

JAVA PLANTATIONS DAMAGED BY VOLCANO.

The plantations of the Rubber Trading Co., Limited, at Soerabaya, and the Djaboong Rubber Maatschappij at Serakentjong, the Kroewoek of the Kroewoek Estates, Limited, and the Kali Koening of the Landbouw Mij., Oost-Java, were severely damaged by volcanic ash during the eruption of the volcano Kloet, near Batavia, Java, last May. The rubber plantations of Soember Petoeng, and, in fact, all plantations, have been greatly damaged by falling ash. The eruption prevented tapping for a period of about five weeks.

J. W. WIJNAENDTS VAN RESANDT, WHO HAS BEEN FOR SEVEN years superintendent of the Anglo-Dutch Estates Agency, Limited, Batavia, Java, recently left that city for a permanent stay in The Netherlands. He is well known among planters of Middle and West Java and especially among those of East Java.

Mr. Wijnaendts van Resandt came to Java in 1902 where he acquired a practical knowledge of rubber culture, and later studied the cultivation of rubber trees in the Federated Malay States. For several years he served on the board of directors of the Nederlandsch-Indisch Landbouw Syndicaat (N. I. Agricultural Syndicate) and was also a member of the board of the Export Station at West Java.

HARBOR ON SUMATRA'S WEST COAST.

Pulan Bay, a few miles south of Benkulan, on the west coast of Sumatra, has been known for over 250 years as the safest harbor on that coast, and is famous as the "the bay of Selebar," the town from which the pepper came. A good many years ago a big Arab sailing junk sank at the entrance to the harbor and blocked it. Now efforts are to be made to remove the obstacle because the harbor is close to rubber and fiber plantations. There is, moreover, water-power near at hand.

BROWN BAST ON TAPPED HEVEA.

BROWN BAST is the most wide-spread and injurious plague of plantation rubber in the Far East, and is therefore being investigated in the laboratories of Ceylon, Malaya, Southern India and the Dutch East Indies. The disease and its effects are described by Professor T. Petch in a leaflet issued by the Ceylon Department of Agriculture.

Brown bast attacks the cortex of *Hevea*, apparently only in trees that have been tapped. The tree runs dry, the tapping cut ceasing to yield latex, either wholly or partially, and in the latter case the latex coagulates on reaching the dry part and blocks the cut, so that later latex runs down the stem of the tree instead of along the cut to the vertical channel. This diseased cortex is a yellowish gray, dotted with brown spots and streaks; it may also be sodden and watery. In well defined cases a brown line runs along the cut very near the cambium.

If let alone, the tissue outside the brown line may dry up, forming a scale which, when it pulls off or is removed, leaves a thin layer of laticiferous cortex, one or two millimeters thick, that is speckled or thin and develops nodules. Or else no scale appears, yet the nodules develop under the surface just the same. Then the tree cannot be tapped.

The final effect of brown bast is to form nodules or burrs which interfere with or stop the flow of latex. These are a secondary feature of the disease; if they did not develop it would not be so serious. The disease may attack the whole tree or vital parts or may appear on a portion only of the cortex. Nodules also appear in the cortex that are not formed by brown bast.

Three methods are employed to get rid of brown bast by removing the diseased cortex to the depth that is necessary. These are: stripping; scraping; after which the spot is painted with Brunolinum plantarium, in which Professor Petch has great faith, and tarring. Trees that are badly affected had better be destroyed.

As to the nature of the brown bast, scientific men still differ. A few still believe that it is a fungus or other microorganism which carries infection. Rands, who was an advocate of this theory, seems to have changed his opinion materially. In April he held that "brown bast is an accentuated condition of gum secretion, probably resulting from response of the tree to the present methods of tapping." On the other hand, in January, 1919, the mycologists Belgrave, Perry and Richards reported that they had been unable to discover any microorganic cause for the disease.

W. Bobiloff in the "*Archief voor de Rubber Cultuur*" for May sums up the case in reporting his experiments. The disease either is caused by infection or is a physiological phenomenon. Investigators have been unable to discover the microorganism that could carry it or to produce the infection by putting sound bark in contact with the diseased. Bobiloff experimented with trees on which he tried excessive tapping, and brought on the disease at once. His explanation is that brown bast is formed by drawing the latex from the bark and the cause therefore is purely physiological. The brown degenerate substance gave the principal reactions for lignine; so he holds that it is not yet proved that it is a gum, as Rand asserts. Harrison connects it

with wood pulp. The slightest trace of brown bark could be detected by a phloroglucin reaction, which colored the spot red. The severity of the disease depends on the general physiological condition of the trees.

Agriculturists, as contrasted with laboratory men, advise giving the trees a rest, in the first place, then, that the soil be manured and drained, etc. They suggest that trees be raised from seedlings instead of cuttings, as those are believed to be less subject to disease, and tapping be improved so as not to wound the trees so severely. All seem to agree that tapping and the condition of the tree have more to do with the disease than possible infection.

PLANTING RUBBER IN WEST DUTCH BORNEO.

By J. W. Evans.

SAY "Dutch East Indies" to an American rubber man and he thinks of Java, Sumatra and a few islands of comparatively slight importance. But only an exceptionally well-informed man would think of West Dutch Borneo. Concerning that region as a field for the rubber man, next to nothing is known. It is generally understood that there is considerable coconut growing along the coast from Paloh to Pontianak, but that's about all.

Rubber cultivation has grown enormously in West Borneo during the last ten years, and the only reason why the fact is not known and the opportunity not recognized is that almost none of the rubber estates are owned by Europeans or Americans. Almost 90 per cent of the rubber plantations are in the hands of Chinese, Malays, and Japanese.

The reason why so little European or American capital has found its way to the rubber cultivation of West Borneo is that the region has been a field for irresponsible speculation. Sound investors have been afraid to go in there because various estates were opened up either by people who knew nothing about rubber and the conditions in Borneo, or by people who formed syndicates purely for speculation, and got from under as soon as their object was accomplished.

In consequence of such fast and loose methods the country got a bad name which it was far from deserving, for the condition of soil, climate, labor, and transportation are such that extensive and profitable rubber cultivation is perfectly practicable there, and the field is new.

Borneo, as a field of rubber, compares favorably with the East coast of Sumatra, the Straits Settlements, the Federated Malay States, and even Java. As to climate, indeed, it is especially suitable. Rain falls there in right proportion all the year, and there is no dry season such as Java has to contend with. That the soil is excellent is shown by the rapid growth of trees and the large yield of latex.

Here are some production figures from one estate in West Dutch Borneo which was badly run, and so neglected, and which suffered so much from the wild boar that it might have been expected to produce poorly. Seven-year-old trees which were planted too close and had never been thinned, produced as a yearly average 3.65 pounds per tree. Compare that with the results from 7 to 9-year-old trees elsewhere. In Malacca the average annual yield per tree is 2.42 to 3.41 pounds; in Ceylon, .77 to 1.65 pounds; in West Java, 2.42 pounds; on Sumatra's East Coast, 3.98 pounds on choice estates, and 2.97 pounds on average estates.

By contrast, there is an exceptionally well-kept Chinese-owned estate in Sambas, a locality in West Dutch Borneo where the trees were well spaced, and the yield for 6 to 7-year-old trees amounted to 5.28 pounds per tree a year.

Contrary to the general impression, labor conditions in West Borneo compare favorably with those in the Federated Malay

States, the Straits Settlements and Sumatra East Coast; for these places depend for labor on emigration from Java, China and British Indies, while Borneo has an abundance of local laborers. The Dyaks are adapted for heavy work, such as felling jungle; and the Malays for light work, such as weeding, tapping and preparing the product; however, it is not to be understood from this that labor conditions in Borneo are ideal. A big increase in rubber cultivation there might make immigration necessary. But at present the estates owned by Europeans are worked with help locally obtained. Japanese contract labor, however, is sometimes cheaper.

Transport facilities are not what they should be, but that is met by locating estates near rivers by which very cheap transportation to harbors becomes possible. In the developed rubber regions such as Sumatra East Coast, thousands are spent yearly for the building and upkeep of roads, and for bullock carts and motor trucks to carry the rubber from the estates to the nearest railroads or port. This is costly. In Borneo a lighter costing 100 guilders, about \$40, does the work; there is communication with Singapore three times a month.

Here are some figures that seem to demonstrate that West Borneo deserves investigation by men who desire to invest in rubber plantations and prefer to do it in a new country:

	Average of Sambas Estates.	26 Java Estates.
Average number of trees per bouw (1.75+ acres).....	203	300
Age of trees	8	7
Average in bearing	497	170
Total output per year in pounds.....	328,720	101,884
Number of trees in bearing.....	93,666	27,953
Average yield per tree in pounds.....	3.45	3.65
Average number of trees per tapper.....	304	300
Average yield per day per tapper in pounds.....	5.95	1.41
Percentage of first-grade rubber.....	79.9	80
All-in-cost per pound, dry, in United States currency.....	0.18	0.17

It must be borne in mind that most of the estates are in the hands of Malays and Chinese, who do not get anything like the yield of rubber that they might if they knew scientific rubber culture. What Borneo is capable of with the right kind of rubber culture is certainly worth attention and investigation.

RUBBER IN THE STATE OF VERA CRUZ, MEXICO.

(Special Correspondence.)

MANY RUBBER PLANTATIONS were located in Vera Cruz. The state has suffered much during the last two years. It is overridden with all kinds of bandits. Some claim to be political chieftains, like Felix Diaz and Pelaez, but the rest are plain bandits. Pelaez is controlling the oil zone below Tampico. Rubber grows in that neighborhood, but no big plantations are known to exist in the territory under Pelaez's control.

Indians are tapping wild trees to a certain extent and they are making nice "ponchos" or rubber coats. They buy from merchants in the Huasteca Hidalguense ready-made garments or "ponchos" made of plain cotton duck, and bring them to their native villages. Then they tap the *Castilloa* and brush the latex on the cotton garments. The latex is spread with an ordinary paint-brush, and between each coating the garments are exposed to the sun for drying. When finished, they have an amber color. The coating is generally made on both sides of the cotton duck. After the goods have been coated several times and are considered ready, they are returned to the merchants in Tulancingo, and other towns of some importance. Very often these Indians have a credit in those country stores, or they are forced to trade there for other reasons. The ponchos made by these Indians are very good sellers, although they do not look as well as imported waterproofs. Their main advantage consists in the fact that they do not stick. Merchants are getting very good prices for these garments as they last very long, and, considering the service they give, are not expensive. If necessary they can be repaired by coating with fresh latex and curing in the sun.

Felix Diaz has control over the southern part of the State of Vera Cruz, and where he is shifting from place to place there are several rubber estates, most of which have been abandoned. However, near San Andres Tuxtla, the large Hacienda de Montepio, owned by Senator Clark, did not suffer very much. The manager had to run, but the estate was left under the care of a Cuban foreman, and was not damaged badly; of course, implements, horses and mules were taken, but that is now considered a trifle in these days of wholesale looting.

Some plantations along the Isthmus line, running from Cordoba to Santa Lucracia, have suffered so much that nearly all of them have been abandoned by their legitimate owners. The country there is overridden with bandits, and one of them, called Panuncio Martinez, is the most dangerous and cruel of all of them. The Carranzistas have not been able to catch him. For a long time his headquarters were at Hacienda del Palmar Grande, near Tezonapa, Vera Cruz, a very beautiful estate which had once been the property of the French firm of Lions Hermanos y Cia, of Puebla, and which became afterwards the property of a Scotch company. One of the brothers, Olsson-Seffer, was the manager for some time. The place has been ruined by the revolutionists, the same as the other neighboring plantations. A big banana plantation on the Rio Tonto has been abandoned, and the same can be said of the big sugar estate called La Oaxaqueña, near Santa Lucracia.

Panuncio Martinez has been terrifying the whole district and from time to time, the Carranzistas attempt to chase him, making things worse for all the unlucky neighbors, because all the places near the headquarters of Panuncio Martinez are sacked and burned in order that he may not use them as a base or a shelter. This was the fate, about a year ago, of the plantation called La Union, of Isidro Barrios y Cia. The place chances to be on the road to El Palmar, yet the owners had no connection whatever with Panuncio Martinez and were begging for protection. The "expedition was a success," as the Carranzista ditty always, states and "Panuncio was done." When retiring to Cordoba the Carranzistas burned La Union, that Martinez might not use it as a base or shelter. That is the method of pacifying the country used by the Carranzistas. Plantation owners are thrown from the frying-pan into the fire when they apply for protection. After such a raid of the Carranzistas, all the fowls, pigs, etc., of the poorer people and the farm-hands, or *peones*, have been taken along with every bit of foodstuff which had escaped from the greedy hands of Panuncio Martinez and other patriots of his class.

THE COST OF BUSINESS IN MEXICO.

One of the principal reasons why so few Americans have attempted to conduct mercantile business in Mexico is shown by the accompanying estimate of the annual expenses of such an enterprise furnished by a business man of Guaymas, Sonora.

State taxes on the business at 8 per cent annually.....	\$200.00
60 per cent Federal tax on State tax.....	120.00
State taxes of 2 per cent on retail sales, estimating that sales amount to \$15,000 per year.....	300.00
60 per cent Federal taxes on \$300.....	180.00
Stamp taxes on retail sales of \$15,000 at 5 mills annually.....	75.00
Municipal taxes, considering the business as fifth class.....	50.00
60 per cent Federal tax on \$50.....	30.00
Water at \$2.50 monthly, one year.....	30.00
Electric lights.....	12.00
One telephone.....	53.80
Rent of building.....	900.00
Interest on a capital of \$25,000 at 12 per cent annually.....	3,000.00
Salaries of office and store employees, including salary of manager.....	7,800.00
Minor expenses, such as paper, stationery, office fixtures.....	142.20
Total	\$13,600.00

Taking 25 per cent as a basis of profit on the cost price of the merchandise, it would require annual sales amounting to \$75,000 to obtain a net income of \$5,750, not counting the \$3,000 which the capital would earn at 12 per cent.

In the estimate, taxes on wholesale transactions are not included, it being presumed that they are paid by the purchaser.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED AUGUST 5, 1919.

- NO.** 1,311,852. Pneumatic tire. J. C. Eubank, Chicago, Ill.
 1,311,898. Resilient wheel. W. Roberts, Calumet, Mich.
 1,312,072. Inner tube with transverse resilient springs. J. W. Blassham, Columbia, Tenn.
 1,312,124. Rubber tire with internal air chamber. E. B. Killen, London, Eng.
 1,312,200. Respirator. A. Patus, assignor of $\frac{1}{2}$ to H. H. Mandel—both of South Kent, England.
 1,312,415. Wheel with rubber tire. D. Moriarty, Oakland, Calif.
 1,312,457. Pressure cage for tires. M. C. Schweinert, West Hoboken, and H. P. Kraft, Ridgewood—both in New Jersey. (Original application divided.)
 1,312,482. Pneumatic tire. H. G. Imhof, Waterloo, Ia.
 1,312,506. Vehicle rim and tire. H. M. Fisk, Chicago, Ill.; N. A. Fisk, administrators.

ISSUED AUGUST 12, 1919.

- 1,312,528. Rubber sole for turn shoes. G. Ferguson, Wollaston, Mass., assignor by mesne assignments to United Shoe Machinery Corp., Paterson, N. J.
 1,312,535. Transversely split detachable rim for tires. C. W. Gressie, assignor by mesne assignments to The Standard Parts Co.—both of Cleveland, O.
 1,312,681. Fountain pen. W. L. Chapman, Brooklyn, N. Y.
 1,312,781. Waterproof coat with thin portion adapted to be folded over upon the ankle portion, etc. H. J. Flannery, Pittsburgh, Pa.
 1,312,830. Electrically heated garment. C. F. Camm, Salt Lake City, Utah, assignor of $\frac{1}{2}$ to W. H. Turner, Los Angeles, Calif.
 1,312,923. M. Rosenwasser, Astoria, N. Y.
 1,312,941. Tea-cup for milking machines. C. M. Anderson, Waterloo, Ia.
 1,313,007. Elastic non-inflatable tire. C. A. Morrison, Delaware, O.
 1,313,021. Hot-water bottle. G. M. Scott, Scotts Mills, Ore.
 1,313,037. Elastic fabric. C. Adams, East Rutherford, N. J.
 1,313,118. Rubber heel. A. Santacrose, assignor of 3/10 to J. Grumbos and 7/10 to S. Sadari—all of Elyria, O.
 1,313,215. Garment supporter. T. L. Cudde, Wadesboro, N. C.

ISSUED AUGUST 19, 1919.

- 1,313,254. Resilient tire. J. W. and G. F. Burgess, Kansas City, Mo.
 1,313,701. Section-cup holding device for portable apparatus. J. B. Loeck, Washington, D. C.
 1,313,400. Detachable heel. C. P. Maher and E. J. Fetherstonhaugh, Montreal, Que., Canada.
 1,313,424. Cushion tire. H. Stern, Moscow, Ida.
 1,313,442. Arch support. L. W. V. Wilms, Chicago, Ill.
 1,313,472. Pneumatic tire. M. A. K. Shotwell, Miami, Fla.
 1,313,506. Inflatable valve for tires. F. Nielsen, Boston, Mass., assignor to A. Schrader's Son, Inc., Brooklyn, N. Y.
 1,313,553. Gas mask and respirator. N. Schwartz, New York City.
 1,313,566. Medicine dispenser. E. C. Trowbridge, Gloucester, Mass.
 1,313,745. Gas mask and respirator. N. Schwartz, New York City.
 1,313,749. Pneumatic tire. F. K. Small, Lisbon Falls, Me.
 1,313,752. Jar-lifting tongs with rubber pads. H. C. Smith, Waterloo, Ia.
 1,313,824. Detachable rim for tires. G. Knowlton, Jr., St. John, Newfoundland.
 1,313,868. Puncture-closing device for tires. B. Ulrich, Milwaukee, Wis.

REISSUE.

- 14,710. Rubber sponge over frame converting it into receptacle for soap, etc. R. F. Hobbs, Great Neck, N. Y. (Original No. 1,173,802, dated February 29, 1916.)

ISSUED AUGUST 26, 1919.

- 1,313,913. Automobile wheel. H. D. Rey, Avarua, Rarotonga Island, Cook Islands.
 1,313,914. Flush-tank bulb. F. T. Roberts, Cleveland, O.
 1,313,923. Garter. W. H. Stevens, New York City. (Original application divided.)
 1,313,924. Pneumatic air and heel support. D. Stewart, Erie, Pa.
 1,313,979. Air-valve attachment for tires on disk wheels. F. Bernardi, Stockton, Calif.
 1,314,104. Fountain pen and clip. J. C. Cahill, Chicago, Ill., assignor to The Wahlberg, Wilmington, Del.
 1,314,110. Sectional detachable rim for tires. J. C. Youngblood, Atwood, Kans.
 1,314,158. Fountain comb. A. R. Spielberger, Atlanta, Ga.
 1,314,185. Bathing-suit or life-preserver. J. M. Combs, Akron, O.
 1,314,299. Life-saving union suit. F. Zaccard and T. P. McDonough, Chicago, Ill.
 1,314,342. Pneumatic roll, with inflatable inner cushion. G. A. Lawrence, Woburn, assignor to The Turner Tanning Machinery Co., Peabody—both in Mass.
 1,314,343. Jointing for vulcanizing rubber parts, as in hot-water bottles. J. L. Mahoney, New Haven, assignor to The Goodyear India Rubber Glove Manufacturing Co., Naugatuck—both in Conn.
 1,314,374. Los Angeles, Cal.
 1,314,393. Rubber heel. D. D. Granger, New London, O.
 1,314,414. Expandible wheel rim. J. H. M. Michon, Washington, D. C.
 1,314,415. Collapsible wheel rim. J. H. M. Michon, Washington, D. C.
 1,314,416. Collapsible wheel rim. J. H. M. Michon, Washington, D. C.

THE UNITED KINGDOM.

ISSUED AUGUST 7, 1919.

- 127,727. Metallic diving-suit with rubber-covered finger joints. R. de Graff, 571 West 139th street, New York City, U. S. A.
 127,776. Shaped toe and heel portions connected by elastic straps, for retaining calash portion of shoes of satin, velvet, etc. F. G. Knowles-Foster, 72 Oakwood Court, Kensington, London.
 127,791. Fountain pen. C. R. Keeran, 360 East Grand avenue, Chicago, U. S. A.
 127,792. Surgical sand-bag covered with loose or adherent envelope of seamless rubber. K. R. Banks, 11A Earl's Court Square, London.
 127,795. Pneumatic sucker fasteners with auxiliary suction cup inside and formed integrally with main cup. C. M. Wolcott, 321 West 118th street, New York City, U. S. A.
 127,818. Tire valve. Michelin & Cie. Clermont-Ferrand, France. (Not yet accepted.)
 127,884. Telephones for aviators, with elastic bands, rubber gaskets, etc. Western Electric Co., Norfolk House, Victoria Embankment, Westminster. (Le Matériel Téléphonique Société Anonyme, 46 avenue Breteuil, Paris.)
 128,009. Fountain pen and clip. E. C. R. Marks, 57 Lincoln's Inn Fields, London. (Conklin Pen Manufacturing Co., Toledo, O., U. S. A.)
 128,024. Cushion tire with soft rubber tread and hard rubber base. F. W. Howarth, 10 New Court, Lincoln's Inn Fields, London. (K. F. & C. Tire & Rubber Corp., 610 MacBain Building, Roanoke, Va., U. S. A.)
 128,063. Rubber tire. F. W. Howarth, 10 New Court, Lincoln's Inn Fields, London. (K. F. & C. Tire & Rubber Corp., 610 MacBain Building, Roanoke, Va., U. S. A.)
 128,113. Chewing gum containing caffeine or a derivative. S. W. Cramer, 401 East Morehead street, Charlotte, N. C., U. S. A.

ISSUED AUGUST 13, 1919.

- 128,309. Breathing apparatus. R. H. Davis, 187 Westminster Bridge Road, London.
 128,340. Hair-curling appliance. C. Nessler, 657 Fifth avenue, New York City, U. S. A.
 128,384. Saddletree for cycles, etc., made of vulcanizable, fiberized rubber and comminuted cotton, reinforced by wire or cords. J. Kelley, 41 Spon street, Coventry, and H. Jelley, Westover, Selly Park, Birmingham.

ISSUED AUGUST 20, 1919.

- 128,426. Rubber pencil shield. G. J. Pagc, 60 Myddleton Road, Bowes Park, London.
 128,505. Pneumatic rim. A. Wroe, Sydney Grove, Lamcote, Radcliffe-on-Trent, Nottinghamshire, and E. Jennings, 7 St. Peter's Place, Broad street, Birmingham.
 128,529. Latex-collecting spout. W. J. Thornhill, 4 Millbank street, Westminster.

ISSUED AUGUST 27, 1919.

- 128,844. Flush-tank bulb-valve of rubber, etc. F. T. Roberts, 1105 Lakeview Road, and R. H. Rosenfield, 1895 East 71st street—both of Cleveland, O., U. S. A.

THE DOMINION OF CANADA.

ISSUED AUGUST 19, 1919.

- 192,194. Respirator. E. D. Rogers, Oakdale, Ia., U. S. A.
 192,215. Breast pump. Becton Dickinson & Co., Rutherford, assignee of O. R. Schwidetzky, Hasbrouck Heights—both in New Jersey, U. S. A.

ISSUED AUGUST 26, 1919.

- 192,252. Truck tire. H. R. Foley, Minneapolis, Minn., U. S. A., and M. L. Foley, Toronto, Ont.
 192,279. Resilient wheel. S. Grossman, New York City, U. S. A.
 192,280. Inner tube. J. H. Hamlin, Winston-Salem, N. C., U. S. A.
 192,281. Wheel with solid core, for carrying pneumatic tire. W. H. Hayter, South Norwood, London, S. E. 25, Eng.
 192,295. Hot-water bottle. A. H. Leighton, McMinville, Ore., U. S. A.
 192,301. Captive balloon. L. N. Lewis, Detroit, Mich., U. S. A.
 192,333. Diving dress. F. W. Walters, Auckland, N. Z.
 192,335. Resilient wheel. S. A. Wheatley, La Grande, Ore., U. S. A.
 192,350. Safety spring slings for parachutes. The E. R. Calthrop & Aerial Patents, Limited, assignee of E. R. Calthrop—both of London, Middlesex, Eng.

ISSUED SEPTEMBER 2, 1919.

- 192,471. Parachute. The Goodyear Tire & Rubber Co., assignee of R. H. Upson, both of Akron, O., U. S. A.

THE FRENCH REPUBLIC.

PATENTS ISSUED, WITH DATES OF APPLICATION.

- 490,301. (May 29, 1918.) Improvements in the manufacture of gloves, of P. C. Ayers.
 490,333. (May 31, 1918.) Pneumatic decoy for blackbirds. M. Verando, (September 4, 1916.)
 490,630. (May 31, 1918.) Hermetic seal for all kinds of tuns, casks, and B. Epinat.
 490,688. (June 29, 1918.) Rim for pneumatic tire. Steniments Rim Co. (July 2, 1918.)
 490,719. (July 2, 1918.) Lift for shoe heels. T. Hendon.
 491,679. (May 13, 1918.) Resilient wheel. H. W. Blacklock and M. W. Bill.
 491,757. (September 14, 1918.) Tire valve. A. Schrader's Son, Inc., Brooklyn, N. Y., U. S. A.

- 491,758. (September 14, 1918.) Suction pump couplings, etc. A. S. Hader's Son, Inc., Brooklyn, N. Y., U. S. A.
- 491,777. (September 14, 1918.) Improvements in wheel tires. F. W. Edwards.
- 491,785. (September 10, 1918.) Shoe with pneumatic sole. G. E. C. Gerber.
- 491,717. (September 12, 1918.) Improvements in a rectal douche. T. H. McNamara.
- 491,854. (September 9, 1918.) Wheel tire and its method of manufacture. K. F. & C. Tire & Rubber Corp.
- 491,862. (September 20, 1918.) Improvements in applying flexible rubbers to replace spring-plates of vehicles. W. F. Cottrell.
- 462,063. (October 3, 1918.) Improvements in rubber tires, particularly solid tires. Société Française B. F. Goodrich.
- 492,095. (December 26, 1917.) Pneumatic wheel with internal pressure, applicable to all vehicles and particularly to automobiles, motorcycles, airplanes, etc. J. M. C. Senery.
- 492,022. (September 30, 1918.) Improvements in artificial limbs. C. A. Adams.
- 492,121. (August 3, 1916.) Life-saving apparatus. R. Kujia.
- 492,232. (October 10, 1918.) Improvements in automobile wheels, etc. E. A. Vivinus and J. G. Raphael.
- 492,172. (October 19, 1918.) Improvements in leggings. Mme. E. Charlet, née B. F. Bergeon.
- 492,172. (October 5, 1918.) Improvements in removable nails for heels. G. W. Berry.

NEW ZEALAND. ISSUED JULY 24, 1919.

- 41,351. Reinforced cover for pneumatic tires. W. J. Dalby, Orient Road, Magill, South Australia.
- ISSUED JULY 24, 1919.
- 40,490. Resilient wheel. C. C. Crump, McKenzie Road, Khandallah, Wellington, N. Z.
- 40,775. Inner tube of shingle construction. I. B. Jeffries (trading as Isaac Benjamin), 3 John street, Llandely, Carmarthen, Wales.
- 41,552. Safety foot for ladder, crutch, etc. H. H. Amadio, 150 Regent street, Redfern, near Sydney, N. S. W.
- 41,665. Corset with elastic vest section. A. C. Hopwood, 408 Commerce House, Flinders street, Melbourne, Victoria. (Nominée of the Dominion Corset Co., 29-45 Dorchester street, Quebec, Canada, assignee of S. J. Newman, New Haven, Conn., U. S. A.)

TRADE-MARKS. THE UNITED STATES.

- N^{O.} 99,332. The words **ARCT BUTLER**—arch supports. Alexander E. Block, St. Louis, Mo.
- 100,808. The word **LOXO**—soles of artificial leather. Madelether Co., Saug, Mass.
- 105,530. The words **GOLDEN RULE**—rubber boots and shoes. United States Rubber Co., New York City.
- 109,279. The words **LIFE**—chewing gum, etc. Mint Products Co., New York City.
- 111,216. The word **KEAPKO**—artificial leather. Charles H. Kemper, Westport, Conn.
- 115,952. The word **REPAIRO** in white letters against a black rectangle—rubber patches for repairing rubber or fabric articles. Helmer E. Erickson, Chicago, Ill.
- 116,662. Representation of a rubber-heel lift bearing the words "**DIAMOND GAIR**" and a knurled diamond—rubber heels. Robert E. Miller, Inc., New York City.
- 116,683. The word **FIKAK**—rubber tires. The Fisk Rubber Co., Chicopee Falls, Mass.
- 117,226. Representation of a shield, quartered, bearing a conventional design—rubber-tire casings. The General Tire & Rubber Co., Akron, O.
- 117,693. The words **REPCO**, **SERVICE**, **QUALITY**, **RELIABILITY**, **VALUE** within the center and border of a white-bordered black diamond—rubber tires. Republic Rubber Tire & Shoe Co., New York City.
- 117,911. The word **WYNNE**—rubber and canvas bicycle tires and tubes. Simmons Hardware Co., St. Louis, Mo.
- 118,029. The word **ITS** within a circle—rubber heels and soles. Charles M. Wickett, East Los Angeles, Calif.
- 118,185. The words **HORSE-SHOE**—tires superimposed above the representation of a horse-shoe. Racine Auto Tire Co., Racine, Wis.
- 118,363. The word **CACTUS**—cement for use in patching rubber and fabric goods. Automotive Supply Co., Dallas, Tex.
- 118,381. The word **DOORLEX** within a double-outlined oval—rubber tires. Austin Holcomb, Los Angeles, Calif.
- 119,242. The outline of a mitten—pneumatic tires. Worth L. Mitten, Davenport, Ia.

THE DOMINION OF CANADA.

- 24,809. The words **JOY RINER**—chewing gum, etc. Frederick Weeb Brooke, Toronto, Ont.
- 24,816. Representation of a piece of rope in the form of a circle enclosing the words **MINER'S** and **TAUMER** and a device resembling the letter **M**—rubber footwear, heels and soles, clothing, coverings, cloth, belting, hose, tires, insulating material, and rubber cement. The Miner Rubber Co., Limited, Montreal, Que.
- 24,817. Representation of a piece of rope in the form of a circle enclosing the words **MINER'S** and **ACE** and a device resembling the letter **M**—rubber footwear, heels and soles, clothing, coverings, cloth, belting, hose, tires, insulating material, and rubber cement. The Miner Rubber Co., Limited, Montreal, Que.
- 24,865. The word **GUARD**—pneumatic tires, etc. Van der Linde Rubber Co., Limited, Toronto, Ont.

THE FRENCH REPUBLIC. TO AMERICANS.

- 26,440. The words **WALSH**—brushing brush "HAPPY" and the **HAROLD**—shaving brushes with bristles set in rubber. Walsh-Patterson Co., 914 South Michigan avenue, Chicago, Ill., U. S. A.
- 26,463. The words **FABRIKOP**—imitation leather. Du Pont Fabrikoid Co., Wilmington, Del., U. S. A.

NEW ZEALAND. TO AMERICANS.

- 15,154. The words **VULCO-CORD**—machine belts, particularly automobile belts. The Gates Rubber Co., Denver, Colo., U. S. A.

DESIGNS.

THE UNITED STATES.

- N^{O.} 53,672. Tire. Patented August 5, 1919. Term 3½ years. Arthur Breitenstein, Akron, assignor to Richard J. Birch, Cleveland—both in Ohio.
- 53,675. Tire. Patented August 5, 1919. Term 7 years. Isaac R. Davies, Lakewood, O.
- 53,676. Tire. Patented August 5, 1919. Term 7 years. Isaac R. Davies, Lakewood, O.
- 53,677. Tire. Patented August 5, 1919. Term 7 years. Isaac R. Davies, Lakewood, O.
- 53,692. Tire. Patented August 5, 1919. Term 14 years. Robert J. Stokes, assignor to Thermoid Rubber Co.—both of Trenton, N. J.
- 53,693. Tire. Patented August 5, 1919. Term 14 years. Robert J. Stokes, assignor to Thermoid Rubber Co.—both of Trenton, N. J.

- 53,709. Tire. Patented August 19, 1919. Term 14 years. C. W. Greene, assignor to The Bowling Green Rubber Co.—both of Toledo, O.
- 53,727. Tire. Patented August 26, 1919. Term 14 years. Arthur Breitenstein, Akron, assignor to Richard J. Birch, Cleveland—both in Ohio.
- 53,736. Automobile running board. Patented August 26, 1919. Term 14 years. John T. Hayne, Detroit, Mich.
- 53,737. Automobile running-board mat. Patented August 26, 1919. Term 14 years. John T. Hayne, Detroit, Mich.
- 53,749. Tire. Patented August 26, 1919. E. A. Reid, Trenton, N. J., assignor to Ajax Rubber Co., Inc., Millbrook, N. Y.
- 53,750. Tire. Patented August 26, 1919. E. A. Reid, Trenton, N. J., assignor to Ajax Rubber Co., Inc., Millbrook, N. Y.

EDUCATIONAL MOTION PICTURES FOR FACTORY ENTERTAINMENTS.

The Bureau of Commercial Economics, Washington, D. C., circulates free educational motion picture films just as the Carnegie library circulates books without charge. It is an altruistic association which makes no profit on its films, being supported by endowment, annuity and voluntary subscription. With 21,000,000 feet of film on almost every conceivable subject, it has the largest educational film library in the world. Three subjects taken at random from the Bureau's catalog are "The Milk of the Tree" (Rubber), "Making Raincoats," "For the Common Good" (Welfare), Firestone Plant.

The Bureau provides the best source of films suitable for exhibition to rubber and allied trade employees in factories and club houses. Francis Holley, the director, urges employers of labor to let their work people feel that such picture shows belong to them. The employer could offer to provide space and equipment if the employees will run the show—select programs, order the films, etc. Thus a point of cooperation would be established between employer and employees that would be worth many times the cost of providing the "theatre." When necessary the Bureau will send a truck fully equipped to show the pictures outdoors at night.

Review of the Crude Rubber Market.

NEW YORK.

SEPTEMBER has been marked by a rather remarkable advance in the price of rubber of all grades that has lasted throughout the month. Ribbed smoked sheet, which sold for 44½ cents spot at the close of August, rose as high as 55 cents, at which price sales were made. There was a slight decline in prices towards the close of the month, due to speculative dealers going a little ahead of the actual demand, but the market is very firm and the demand for rubber strong. Manufacturers, not only of tires but of all kinds of goods, have been buying largely and have seemed ready to pay higher prices, but only for the amount of rubber they actually need. There has been a good deal of trading among dealers, which has caused some slight fluctuations in prices, but the demand is from consumers, so that prices are likely to stay up till they are supplied. The prices in the London market are higher than in New York.

The assertions that many Far Eastern planters have held back part of the product of their plantations out of patriotic regard for the requests of the British Government are not wholly credited by American importers, who do not believe that Singapore commands any very large reserve stock of rubber.

The Brazil market was quiet and inactive; the quantity yielded now is inconsiderable in comparison with the world's product and consumers are willing to pay the higher price only for the quantity they need, which is limited.

For guayule and balata the market has been very quiet.

Prices for plantation and for South American rubber at the beginning and toward the close of the month are shown in the following quotations:

PLANTATION HEVEA. August 30, first latex crépe, spot 45½ cents, October-December 46½ cents, January-June 47 cents, January-December 1920, 48½ cents. September 22, first latex crépe, spot 50 cents, October-December 50 cents, January-March 51 cents, January-June 51 cents, January-December 1920 52 cents.

August 30, ribbed smoked sheets, spot 44½ cents, October-December 45½ cents, January-March 45½ cents, January-June 46 cents, January-December 1920, 47½ cents. September 22, ribbed smoked sheets, spot 49 cents, October-December 49 cents, January-March 50 cents, January-June 50 cents, January-December 1920, 51 cents.

August 30, No. 1, amber crépe, spot 42 cents, October-December 4½ cents. September 22, No. 1 amber crépe, spot 47 cents.

August 30, clean thin brown crépe, spot, 40 cents, October-December, 42½ cents, September 22, clear brown crépe, spot 48 cents.

August 30, No. 1, roll brown crépe, spot 32. September 22, No. 1 roll brown crépe, spot 36 cents, October-December, 36 cents, January-March 38 cents.

SOUTH AMERICAN PARA AND CAUCHOS. Spot Prices: August 30, upriver fine 54½ cents, islands fine 57 cents, upriver coarse 32 cents, islands coarse 22 cents, Cameté coarse 22 cents, cauchó ball upper 32 cents. September 22, upriver fine, 55 cents, islands fine 49 cents, upriver coarse 34 cents, islands coarse 22½ cents, Cameté coarse 22 cents, cauchó ball 33½ cents.

THE MARKET FOR COMMERCIAL PAPER.

In regard to the financial situation, Albert B. Deers, broker in crude rubber and commercial paper, No. 68 William street, New York City, advises as follows:

"During September there has been a fair demand for paper, mostly from out-of-town banks, and the best rubber names have been taken at 5 1/2 to 5 3/4 cents, and those not well known 6 to 6 1/4 per cent."

WEEKLY RUBBER REPORT.

GUTHRIE & CO., LIMITED, Singapore, report [July 31, 1919]:

At the weekly rubber auctions held yesterday and to-day, manufacturing interests were well represented, and there was a good demand for all grades. At the commencement of the sales, fine pale crepe realized up to 23 cents (two lots sold for 23 1/2 cents), while ribbed smoked sheet was readily taken up at up to 7 1/2 cents. On resuming to-day the demand did not appear to have fallen away to any appreciable extent, and closing prices were 23 cents for crepe and 70 cents for sheet.

Brown and dark crepe were in good demand at from 1 to 1 1/2 cents advance on last week's prices.

The quality catalogued was 1,022 tons, of which 899 tons were offered and 694 tons sold.

The following is the course of values:

	In Singapore, per Pound, ¹	Sterling Equivalent per Pound in London.
Sheet, fine ribbed smoked.....	67 1/2 c @ 7 1/2 c	1/9 1/2 @ 1/10 1/2

¹ Quoted in S. S. Currency—\$1 = \$0.567.

BATAVIA RUBBER MARKET.

HERMANS, MARSMAN & CO., Batavia, report [June 15—July 15, 1919].

The market showed some improvement during the last month and several big parcels changed hands. There was more demand for forward deliveries especially from the side of American buyers. The signing of peace caused only a small increase of prices. The market closed with the following quotations:

	In Batavia, Per 1/2-kilo, ¹ Guilders.	Equivalent Per 1/2-kilo in U. S. Currency.
Fine pale crepe.....	1.20	\$0.60
Prime smoked sheets.....	1.19	.476
Fine pale crepe, basis 75 per cent.....	1.08	.432
Old crepe.....	1.12	.448

¹ Quoted per 1/2-kilo (1.1 lb.) in Dutch Indian guilders (\$0.40).

THE MARKET FOR RUBBER SCRAP. NEW YORK.

DEALINGS in scrap rubber for the month passed has been without activity or notable incident. There is no foreign movement of scrap either import or export.

Market conditions have not met the anticipations of the dealers as regards revival of the trade. The upward tendency of crude rubber has had no effect upon either the scrap or the reclaimed rubber markets.

BOOTS AND SHOES.—The demand has been intermittent and prices steady.

TIRES.—Buying demand has been fair, mostly for picking purposes. Prices have been steady and firm for good stock.

INNER TUBES.—The situation continues without interest.

QUOTATIONS FOR CARLOAD LOTS DELIVERED.

September 25, 1919.

Prices subject to change without notice.

THE MARKET FOR COTTON AND OTHER FABRICS. NEW YORK.

IN THE FIRST WEEK of September there was a sharp decline in middling spot cotton from 32.05 cents to 28.85 cents, the lowest point it reached. It hovered around 29 cents for another week, then rose to a week's variations around 30 cents, and in the last week of the month rose sharply to 31.60 cents.

The Government's estimate of the crop, which in August was 11,640,000 round bales, fell to 11,230,000 round bales in

September and conservative observers expect it to fall below the 11,000,000 mark in the next report, owing to the prevailing wet weather and the ravages of insect pests, making the fifth consecutive year of short crops.

The market is very firm, the strong demand coming not only from Americans but also from Japanese and English buyers, the latter having to make up in some way the deficiency in Egyptian cotton. If Germany can obtain the necessary credits, it is predicted that the price of cotton will rise at once to 40 cents.

EGYPTIAN COTTON. Although obtainable, it is difficult to get because the American buyer must contend with the English and Continental competition, for England must have long-staple cotton if the mills that make many of her staple fabrics are to reopen. This year's crop of Egyptian is estimated at 6,250,000 cantars or 860,000 bales of 720 pounds each and the latest reports are favorable, the boll worm having done less damage than usual. The yield of Sakellaris and of upper Egyptian is expected to be about 20 per cent above the average and the same holds good for Affi. Several cargoes of Egyptian cotton have arrived lately in this country. The prices quoted are for Sakellaris, low grade 52 cents, medium grade 57 cents, high grade 63 cents; for upper Egyptian, low grade 49 cents, medium grade 51 cents, high grade 53 cents.

SEA ISLAND COTTON. Manufacturers have been forced to throw this out of account, practically, owing to the disasters to the crop. In three consecutive years the crop had dropped to nearly one-half of the normal quantity; this year it has shriveled to probably less than 20,000 bales. Manufacturers have been forced to turn elsewhere for their long-staple cotton, and have found some relief from Egypt, from Arizona and from Peru.

AMERICAN EGYPTIAN. The Arizona cotton, while it will not make up for the shortage in other long-staple varieties, will be the largest crop yet produced, from 45,000 to 50,000 bales. There was an active demand for Pima cotton when dealings in the new crop began; for October-December shipments the price for cotton an inch and three-quarters in staple was 67 to 68 cents, with every indication that the mills are substituting it for Sea Island for which a higher price is asked.

TIRE FABRICS. The market is very strong, the product of the mills has been sold in many cases for a year ahead and the factories are working to their limit. It is estimated that the output of tires for the coming year will be between 35,000,000 and 40,000,000. The manufacturers are hampered by the shortage in long-staple cotton and many object to using peelers as a substitute.

OTHER FABRICS. The market for belting and hose is quiet. There is an improved demand for lighter ducks and drills, particularly 46 inches and wider; the manufacturers of rubber goods show more concern about securing supplies than about the price. There is a very strong demand for sheetings which are sold practically to the end of 1920; the same holds good for carriage cloth. There is little demand for Osnaburgs or for general cotton goods, but the tone of the market is better than it was a month ago.

NEW YORK QUOTATIONS.

SEPTEMBER 25, 1919.

Prices subject to change without notice.

40-7 1/2 ounce		14.15 @	
40 8 ounce		14.25 @	

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

NEW YORK.

THE FAST MONTH has been characterized by the brisk demand for chemicals and compounding ingredients that was noted for the month previous. The outlook is favorable for a continuation of active business in all lines.

ANILINE OIL.—There is a scarcity in supply of this material and the price is maintained at 28 cents per pound.

BARYTES.—The demand has been very good. Prices are steady at \$21 to \$21.50 per ton.

BENZOL.—The market is firm and production has been sold in advance at some sources.

DRY COLORS.—The market has improved to a condition of very good demand in standard colors.

LITHARGE.—In common with other lead products consumers' business has been very active.

LITHOPONE.—Despite the brisk demand, some makers are operating at less than full capacity because of scarcity of labor.

MINERAL RUBBER.—Assured business for this staple ingredient has led to an increase of tonnage and brands available and the development of an export trade in the material.

SUBLIMED LEAD.—The same conditions of active consumers demand in this as in other lead products are taxing producers' facilities of output and sustaining firm prices.

WHITING.—There is not an oversupply and prices are steady.

ZINC OXIDE.—The demand and prices remain steady.

THE INTERNATIONAL FLOOR MACHINE.

RUBBER-
TILING
MACHINE

Interlocking rubber tiling is the accepted floor covering for the salons, passageways and cabins of ocean liners. Modern hotels, banks and hospitals have adopted this form of floor covering for special purposes and usually in preference to all others.

The final process of making rubber tiling is buffing, in order to remove any surface inequalities, and the machine here shown is obviously adaptable for this purpose. The grinder disks are motor-driven by the current from any convenient lamp socket. The machine is self-propelled and is guided over the surface by exerting a slight pressure upward or downward on the handle. (International Floor Machine Co., 149-151 West 36th street, New York City.)

FOR the first time in thirty years an issue of this journal appears more than a month late. This was our protest against contract breaking and Soviet rule. We thank our subscribers and advertisers, who, without exception, stood with us throughout the printers' strike.

SUBSTITUTING BANK DEPOSITS FOR PAY ENVELOPES.

MANY EFFECTIVE METHODS of promoting thrift among wage earners have been proposed, but none has more to recommend it than the suggestion that large employers of labor abolish the pay envelope in favor of the bank deposit. According to the plan, each employee would have an account in the firm's bank, to which the amount of his wages would be credited every week, thus getting his total earnings into the bank at the start. From this account he could draw as needed for current expenses, the balance remaining on deposit at interest. Personal pride would thus be stimulated and an inspiration provided to increase the balance every week.

The scheme would appeal to those who had learned through five Liberty Loan drives that the banks are their good friends, and it would mitigate hostility toward banks on the part of others who have never made use of them. Not only would annoyance and waste of time in the long file at the pay window be eliminated, but accounting would be facilitated, and employer and employee alike would benefit through a greater sense of dignity and security than the workingman has ever known.

THE RETURN OF THE BICYCLE.

AMONG MOTORISTS and others who have occasion to observe city streets and country highways closely there is no doubt that the bicycle is coming back. And its return is no transient college girl's whim, for men and women, boys and girls are riding wheels for reasons that bid fair to last. Chief among these are the death of street railways in small towns and sparsely settled communities and the high fares collected on the trolley lines remaining in business. Secondary reasons quite apart from necessity and economy are the pleasures of bicycling and its benefits as a healthful outdoor exercise.

When the bicycle went out of general use several years ago there were few good roads outside of cities, and those were monopolized by automobiles then just coming into popularity. In contact with the oil used on macadam roads the bicycle tires of those days quickly softened, blistered and blew out. Moreover, the salutary law requiring lights on every vehicle at night was then a discouraging inconvenience. Bicycling became dangerous, expensive and troublesome, and lost favor both as a recreation and a mode of locomotion.

But wider and better roads have become the rule, "oilproof" tires have honestly earned their name, and electricity has eliminated the bicycle lamp nuisance. Bicycles themselves have been improved. All the advantages that first gave the bicycle its hold on the public are again as great as before, and the public is responding to these common sense appeals. Indeed, the manufacture of bicycle tires again promises to surpass its highest past records.

MORE FREE PORTS NEEDED.

CONGRESS is belatedly opening its eyes to the necessity of more free ports in the United States. The Administration will probably recommend the passage of a bill creating them. A free port is an area set aside where goods imported from abroad may be stored without customs while awaiting reexportation or other distribution, and, if required here, taxed according to schedule. Such an area is exempt from all the red tape of customs surveillance, bonded warehouses, bonded manufacturing plants, etc., and the goods so brought in may be mixed and repacked, and reexported with system

and dispatch. London has had one for years, and as a result half our imports from England were products of other lands, brought first to the British free port, then resold. As a result, the United States, the greatest user of rubber in the world, got most of this product through England, where the price was set and we paid it, plus the freight.

UTILITY OF THE RUBBER HEEL.

ALTHOUGH THE RUBBER HEEL has been on the market for many years, its utility as compared to the leather heel is only recently admitted. The sale has now run into millions of pairs, and popular prices at retail range all the way from a dime to 50 cents a pair.

Combining all the resisting qualities of the best leather, a rubber heel has the advantage of being resilient, is not cut away as readily as the leather heel on concrete or gravel, is noiseless and saves one from the nerve-tearing jars at every step.

A special pair of rubber heels was recently made for experimental purposes and after being worn for six months were still in good condition. The cost was 75 cents, and on this account they would not be popular as the cost attached would be \$1 a pair. Even at that price they might be more economical than leather heels.

PLANTATION SHARE PROFITS.

NOTWITHSTANDING the continued surplus and low price of crude rubber, British investors still find rubber shares highly profitable. Ample evidence of this is to be seen in the annual reports of well-established plantation companies. For example, the Vallambrosa Rubber Co., Limited, one of the pioneer plantations in Malaya, realized a gross average price of 44½ cents per pound for the total 1918 crop as against 48 cents the previous year, while the "all in" cost of production was 21½ cents per pound as against 23 cents the previous year. In other words, the net profits still remain a trifle above 100 per cent and have enabled the directors to pay an *ad interim* dividend of 25 per cent and to recommend a final dividend of 37½ per cent, making the handsome total of 62½ per cent for the year while still ensuring adequate working capital and an ample reserve.

Doubtless the days of better than 200 per cent yearly earnings, which created a sensation just before the war, will never return, and perhaps some of the younger companies will never even reach 100 per cent dividends, but so long as present conditions continue plantation shareholders have nothing to complain of. By comparison the earnings from rubber manufacturing stocks are a mere pittance. Henceforth, however, demand seems unlikely to exceed supply, and eventually crude rubber may be produced on a margin of profit comparable with that on sugar and similar agricultural necessities of life.

CHINA YEARNS FOR RUBBER FACTORIES.

CHINA now being more or less in the limelight its possibilities as a field for rubber manufacture are not being overlooked. British and American tire manufacturers already maintain small vulcanizing plants there where the repairing of motor car tires is done efficiently. However, until Chinese roads are put into better shape there seems to be no reason to expect a great expansion in the automobile market outside the principal cities. The jinrikishas (the popular vehicle for the local transportation of passengers) are practically all equipped with pneumatic tires, Peking alone having 15,000 in service. But the outlook for rubber footwear manufacture is large, if some enterprising firm supplies the right kind of shoes. The Chinese shoes are made of cloth, good enough for dry weather, but very uncomfortable in the rainy season. About \$500,000 worth of rubber goods are imported into China annually. With plenty of cheap labor and a vast crude rubber supply near at hand, rubber factories are bound to come in time.

GERMANY REVOLUTIONIZES RECLAIMING?

AT LEAST that is the claim of the company owning the Runge and similar processes. A cursory view of all of the solvent processes, German, British, French and American, however, does not bear out the claim.

No solvent process adds value to the rubber extracted. In fact the reverse is true. As for valuable by-products they are few. The most important is the fabric. This can be used to a limited degree as shoddy in mats and floor covering, or as fabric in tire accessories, repair and rebuilding. Where rubber and fabric are plentiful and prices normal the solvent process can hardly compete with existing standard reclaiming processes. The German reclaimer is evidently still living in an atmosphere of blockade scarcity and high prices.

THE FIRST AFTER THE WAR NUMBER OF THAT valuable technical journal the "*Gummi-Zeitung*," dated July 19, 1919, has been received. It opens with an article rejoicing that peace has been declared and it takes the ground that it is no use to go into the why and wherefore of Germany's collapse; facts as they are must be faced and every effort made to upraise Germany again. The way to accomplish this is to work and to trust to the future. The blockade is over, commerce is free once more, peace and the tasks that peace imposes are at hand. Set to work and while working keep thinking: "Germany and the German people must become once more what they were."

FRESH ATTENTION IS CALLED TO THE INCREASED USE OF non-skid tires on motorcycles and the increased use of this vehicle as a delivery car on account of its qualities as a time and money saver in the handling of light parcels. It means more tires and still more.

An Examination of German Synthetic Rubber.

By Lothar E. Weber, Ph. D.

THE SYNTHESIS OF RUBBER has always been a topic of interest to the rubber industry. This interest probably reached a maximum in the summer of 1912, when the experimental results of Drs. Perkin and Hofmann were laid before the chemical world. Rubber had been synthesized as a test tube experiment by numerous investigators in the course of the previous twenty years, but these two men, the respective leaders of independent groups of English and German scientists, were undoubtedly the first to produce synthetic rubber on something more than an academic scale.

The coming of the war had a marked influence on these investigations. The possibilities of a rubber shortage in England being remote, her scientists naturally turned to the solution of more pressing problems. In Germany, however, the rubber situation became acute, even in the early months of the war. Realizing as she did the importance of rubber as a secondary instrument of warfare, it was but natural that she should make a great effort to effect its synthesis, being amply provided with the greatest incentive for inventive research, namely, necessity. One has only to recall the almost humorous methods of petty smuggling to which she resorted, to realize her pressing needs for crude rubber. It is to be expected, then, that she should have made great strides in the commercial development of the synthetic product.

The four samples of synthetic rubber, which the Editor of THE INDIA RUBBER WORLD obtained from Germany and submitted to the writer, exhibited a striking resemblance to natural crude rubber. Three of the samples were intended for the manufacture of soft rubber goods and the fourth for hard rubber. The first three named took the form of crêpe, about one-half-inch in

less fibrous, and could be disintegrated without great difficulty. The dark sample was highly resistant in this respect, much more so than an average brown crêpe, in fact, its behavior was almost characteristic of an admixture of crude and reclaimed rubber.

The light-colored sample showed scarcely any indication of tackiness. This condition was somewhat more apparent in the case of the pinkish sample, chiefly on account of some small viscid globules on the surface of the rubber.

The fourth sample, which was intended for hard rubber, resembled a soft art-gum eraser in color and texture. Although the sample was somewhat spongy, it returned to its original shape rather slowly after compression. It was a trifle sticky to the touch, but by no means tacky. Black combs said to have been made from this rubber had the characteristic black finish and high gloss, which is observed in the highest grade of hard rubber.

Little is known as to the method of preparation of the samples. It is reasonable to suppose, however, that they were produced at the large dye works of Bayer, at Leverkusen. The method employed at this factory for synthetic rubber is to use acetone as a raw material, and by means of aluminum to convert it into a product known as pinacone. The pinacone is then converted into methyl-butadiene, a substance bearing a very close chemical relationship to isoprene. This substance will be recognized as having always been prominently mentioned in connection with the synthesis of rubber. The methyl-butadiene is a thin liquid of low boiling-point, and by the chemical process of polymerization, is converted into synthetic rubber. According to Lieutenant-Colonel J. F. Norris,¹ the polymerization process requires from

LIGHT SYNTHETIC CRÊPE FOR SOFT RUBBER GOODS.

MEDIUM SYNTHETIC CRÊPE FOR SOFT RUBBER GOODS.

thickness. Their color ranged from a reddish-orange, through a pinkish-brown, to that of the characteristic dark-brown. In fact, the last-named sample bore a striking resemblance to a thick brown crêpe. The sample of pinkish-brown color had very much the appearance of washed Massai. The light sample was somewhat more reddish than first crêpe, as we know it; but otherwise it was of excellent appearance.

All of these rubbers possessed considerable toughness and elasticity. The lightest and the darkest were apparently the strongest, and after stretching resumed more equally their normal shape and size. The pinkish sample had considerable strength, but was

four to six months. It is carried out at a temperature of 60 degrees C. The product thus obtained is technically referred to as methyl rubber.

The chemical analyses of the four samples were as follows:

	No. 1	No. 2	No. 3	No. 4
Acetone extract	56	1.92	3.8	1.59
Mineral matter	0.02	0.15	0.09	0.09
Nitrogen	0.12	0.06	0.16	0.07

The acetone extracts are all surprisingly low. They were of a brownish color and of a hard resinous appearance. The nitrogen values are interesting and without doubt signify the presence of

¹Journal of Industrial Engineering Chemistry, Volume 11, page 819.

an organic accelerator. In fact, it is rather probable that the acetone extract consisted in part of such accelerator. Owing to the smallness of the samples no attempt was made to identify the nature of the latter. It was clearly evident, however, that none of the organic bases that are in general usage in this country to-day for accelerating vulcanization had been employed. Probably the accelerator present was a piperidine derivative.

For the purpose of determining the physical properties of the synthetic products the following formula was employed:

	Parts.		Parts.
Rubber	50	Sulphur	5
Zinc	45	Hexamethyleneamine	$\frac{1}{2}$

DARK SYNTHETIC CRÊPE FOR SOFT RUBBER GOODS.

The samples being so small, the three crêpes were blended together and used as a whole. When put on the mill they disintegrated and fell apart rather quickly. In the course of a few minutes, however, the particles began to agglomerate, and in due time assumed the familiar plastic condition of broken-down rubber. The mass differed from natural rubber in that, notwithstanding its plasticity, it was exceedingly tough and this toughness became more marked after the addition of a portion of the compounding ingredients. As the latter were added the toughness of the rubber continually increased, although its plasticity was such that the minerals were readily absorbed.

The mixture was vulcanized in a press for forty-five minutes at forty-five pounds. The physical tests obtained are tabulated below. For the sake of comparison, there is inserted the physical tests obtained from an average sample of first latex crêpe vulcanized in the same compound.

	Synthetic Rubber.	First Latex Crêpe.
Tensile strength	910 lbs.	2806 lbs.
Elongation at breaking point	750%	675%
Permanent set	25%	25%

In order to determine the aging properties of the synthetic rubber the vulcanized samples were subjected to a temperature of 150 degrees F. for seven days. The following results were obtained:

	Synthetic Rubber.	First Latex Crêpe.
Tensile strength	800 lbs.	2230 lbs.
Elongation at breaking point	650%	650%
Permanent set	25%	25%

The results of the physical tests do not compare very favorably with those of a high-grade natural rubber. They are, in fact, more comparable to the properties of an inferior brown crêpe. The whole general appearance of the vulcanized synthetic rubber, and especially its flabby and lifeless condition, reminded one very strikingly of vulcanized brown crêpe.

It will naturally be asked whether this method of synthesizing rubber is capable of large scale technical application. In other words, is there any reasonable possibility of synthetic rubber becoming the competitor of the products of the plantations?

Prophecy is always dangerous and frequently idle. On the basis of the above samples, however, closely confirmed by rumor and hearsay, very big improvements must still be made in the synthetic product in order that it may compete in quality with natural rubber. It is not fair to assume that the scientific possibilities of improving and cheapening plantation rubber are just as great as the scientific possibilities of the present art of synthesizing rubber?

LIGHT SYNTHETIC BLOCK RUBBER FOR HARD RUBBER GOODS.

The complete victory of synthetic indigo over the natural dye-stuff would have taken a different course had the indigo plantations been as scientifically operated as are the rubber plantations to-day.

It cannot be denied that the production of this rubber is an astounding chemical accomplishment. It may be said, without much danger of contradiction, to represent the climax of modern synthetic chemistry, in that for the first time it has been possible to produce upon a commercial scale a representative member of the group of enormously complex substances known as colloids. As such it marks the beginning of a new era in chemical synthesis. It is very problematical, however, whether the benefits of this discovery will accrue directly to the rubber industry. Chemistry as a whole becomes enriched and especially that branch of chemistry dealing with colloids. It has become generally recognized during recent years that nearly all biological processes are colloidal in their nature, and it is in the further study and synthesis of colloids that the knowledge gained from the synthesis of rubber should receive its greatest application.

COLONEL OSTERRIETH GREETS HIS KING.

Conspicuous among those prominent in the greeting of the Belgian King and Queen in New York City early in October was the commanding figure of Colonel Leon Osterrieth, military attaché of the Belgian Embassy. Colonel Osterrieth, it will be recalled, was a crude rubber merchant in Antwerp and owns rubber plantations in Java and Malaya. He was the delegate for Belgium at the International Rubber and Allied Trades Expositions of 1911 and 1914 and was on his way to the Rubber Congress in Java when war was declared in 1914. After gallant service in the Belgian Army he came to America with the Belgian Mission in 1917 and is now stationed at Washington.

Rubber Instead of Typesetting.

RUBBER instead of typesetting is not a mere possibility, but a practical reality. In printers' circles the process has been known quite a while, but somehow it never attracted very much attention and was comparatively little used. Those who saw possibilities in the process admitted that something or other would have to happen, something quite unforeseen probably, before wider circles would become interested. Then, quite recently the unforeseen happened. A group of compositors went on a "vacation," and tied up the New York publishing industry for eight weeks. Meanwhile a few men started thinking quite hard, and this thinking bore fruit, various methods of doing away with typesetting being tried. In one of these processes rubber plays an essential part.

A well-known New York publisher has just published a book, the whole of which has been produced from photographs transferred to rubber without any typesetting at all. It is the first book ever issued in this manner in the whole history of publishing. The work was done for the publishers by one of the many offset printing firms of New York City. Before describing the process by which the book was produced, however, we will briefly outline the history of offset press work.

The first actual tin-plate rotary was conceived in 1903 and was exhibited by George Mann & Co. in 1909 at the printing exhibition in London. Shortly after this, Ira W. Rubel chanced to be in a lithographic machine room, when the operator failed to feed a sheet of paper, the impression taking place on the rubber blanket. A few seconds later, on the back of the next sheet fed to the press, a better impression was found than the one on the front of the sheet made by the metal. The operator probably soon forgot the occurrence, but not Ira W. Rubel.

few men thought that offset work would ever compete with general typography, ordinary printing was so well established, it could be done so satisfactorily and at fairly reasonable rates, there being no lack of compositors, while, on the other hand, offset work demanded highly skilled men, of whom there were not

MANN PATENT TWO-COLOR AND PERFECTING PRESS.

THIS MACHINE WILL PRINT TWO COLORS SIMULTANEOUSLY ON ONE SIDE OF THE SHEET, OR ONE COLOR ON EACH OF THE TWO SIDES AT THE SAME TIME.

many. It was indispensable to do the right thing at the right moment; a slight oversight might result in a poor job. Besides which, in the early days the stone used gave a good deal of trouble; it frequently broke and was expensive.

In the present-day rotary machines stone is replaced by aluminum or zinc. Mr. Rubel, if he were alive to-day, would hardly have an opportunity to catch a feeder failing to feed a sheet, as most of the larger machines have automatic feeders. All the offset machines produce prints as set-offs instead of doing so by direct printing. The last impression can be made as clear and distinct as the first. There are zinc plates in the market made by manufacturers by more or less secret processes, but many firms doing offset printing make their own plates at less than half the cost.

One advantage of the offset process is that any kind of paper can be used advantageously. Work on cards succeeds equally well, while unusually pleasing effects have been produced on celluloid, as no damping of any stock is necessary. It has even been found possible to turn out the cheaper kind of little flags, which are so largely sold at parades and public celebrations, by the use of one of the existing offset presses.

Absolutely high-grade color work can be done by the process, even nine-color work in perfect blending has been exhibited. Salesmen of the various machines have naturally praised them very highly and yet purchasers of the machines have frequently been disappointed by the quality of the work turned out by their men, thoughtlessly blaming the machines and the salesmen.

The machine operators must "know how" and take pride in their work. The machines respond to skilful control and fine work is the result. First-class operators earn first-class incomes, which are gladly paid by their employers in this line of business. It is the ability of offset press workers and their willingness to use their ability that gives value to the machines. When the work turned out is poor, the operators are probably to blame, though in some cases other factors enter into consideration.

One very striking difference between ordinary printing presses and offset presses is that on the latter copper plate engraving, reading matter, half-tone work, etc., can be printed at one and the same time. At present, reading matter produced on offset

THE RUBEL TYPE ROTARY OFFSET MACHINE.

Two years later his machine embodying the new use for rubber was on the market. Offset press work was completely revolutionized by the new machine, and it is a matter for regret that Mr. Rubel only survived its introduction by about two years. Since that time various machines have been invented; they are associated with the names of Mann, Harris, Waite, Potter, Scott, Hall, Fuchs, Lang, Killlogg, Bentley, Jackson, Saville and others in the United States and Great Britain.

Offset printing has been used for a dozen years, more or less. Letter-heads, illustrations and a few other things have been quite extensively produced by the process. And many firms have done excellent work along these lines. But, as already stated, very

machines without the aid of printer's type offers one drawback which is very noticeable, and that is the unevenness with which the lines end. The reason for that, however, is that the text is typewritten on ordinary typewriters, and then photographed. The lines end, therefore, as all typewritten matter ends, very irregularly. The experimental departments of all the greater typewriter companies are now hard at work seeking a way to make lines end evenly, and one of these days American ingenuity will solve the problem. Offset work will then find new fields of usefulness which it has up to now been quite unable to enter with any notable success.

Offset work is cheaper than ordinary typographical work, and can be turned out more rapidly. One of the reasons for greater economy is the difference in the time necessary for the make-ready. In ordinary typographical work the make-ready frequently takes up hours. In offset work that which takes the place of the make-ready requires an almost negligible amount of time, with a corresponding saving of money.

There are four stages in the execution of the work which can be described so that the reader will fully understand the process.

1.—The text, which has been carefully typewritten on new machines to insure equal pressure of each letter on the paper and to guarantee perfect alignment, is photographed.

2.—An ordinary zinc line plate is made from the photographic glass negative thus obtained, the negative image being reversed to a positive image in the course of the transfer after the customary manner of photographic process work.

3.—The zinc plate, ordinarily with several others, is arranged in a form as usual and put in the press, where it is inked in the customary manner by rollers, and an ink impression of the plate is transferred to a rubber covered metal cylinder, this impression being negative in the sense that the type is reversed left for right and reads backwards.

4.—The operation of the press is so timed and arranged that a sheet of paper is then fed through it and the ink impression transferred by direct contact from the rubber blanket on the cylinder to the surface of the paper, where it becomes a positive impression reading from left to right.

After use, the rubber-covered cylinder is very easily cleaned, and the surface can be used again and again, until the rubber is worn out. The rubber blanket may last less than a month or over two months, depending on the amount of work done, and particularly on the kind of stock used. Coarse, hard paper will naturally wear out the rubber sheet quicker than other kinds of stock.

When black ink is used, from 3000 to 4000 copies per hour can be run off a good machine. Color work is naturally done much more slowly. The ink used for offset work dries very quickly, and the stock, as already mentioned, is never dampened, so that the sheets coming off the press can be almost immediately folded into booklets, books, etc., and be delivered to the customer. Sheets coming off typographical presses must be allowed to dry for a considerable while before they can be folded or handled in any way.

The machines used to-day for offset work are not perfect, but manufacturers will now doubtless feel encouraged to remedy defects. The largely increased fields of sale now opening up offer possibilities of augmented profits sufficient to warrant considerable effort at improvements.

Rubber men will probably be interested in a few remarks on the rubber covering for the rollers, with which we will end our story.

The thickness and the degree of elasticity of the rubber blanket covering the cylinder are features that have demanded many and long-continued experiments. The entire blanket must be of absolutely uniform thickness, as the slightest defect in its uniformity renders the whole unfit for use.

The best printer's blanket for offset work has always been imported from Europe. Before the war, the best blanket, in small sizes, was made in Germany, but the Germans were utterly un-

able to succeed in the larger sizes, in which Great Britain has achieved preeminence, producing extremely fine printer's blankets up to 70 inches and even more in width. Before the war these imported blankets sold in the United States at \$4 a square yard. The price varies these days considerably but is, of course, much higher.

The expansion of offset printing in tropical and subtropical countries depends largely on the rubber chemist. Printer's blankets that give good results in New York or London may not give satisfaction in very hot or damp countries. These sensitive rubber blankets suffer from high temperatures combined with great atmospheric moisture.

Here is an interesting and lucrative field for the American rubber industry.

INTERESTING LETTERS FROM OUR READERS.

DESIRES TO SUPPLY ZINC SULPHIDE TO THE TRADE.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR:—A few days ago I was showing a sample of zinc sulphide to a subscriber to your magazine and a manufacturer of rubber goods. He was not using zinc sulphide himself but claimed that it is peculiarly adaptable to use in the rubber trade in the manufacture of particularly white goods, due to sulphur from the sulphide in some way reacting with the rubber.

We looked through a recent number of the magazine to find a quotation on zinc sulphide, which, he said, was formerly listed there. He then suggested my addressing you as the best authority on the wholesale market for zinc sulphide and as to who are using zinc sulphide now.

I hope that you may be able to furnish me this information, for I have a small plant for making pure zinc oxide in hundred-pound lots that can be immediately turned into a zinc sulphide plant, and can expand to a large plant should I find a large field for the product. This information would be most timely to me, and if there is a demand for zinc sulphide, will also be of value to your advertisers.

Awaiting this information and a reply from you, I am,

Yours most sincerely,

SAMUEL T. HALSTED.

163 Rubidoux avenue, Riverside, California.

SEASONS' SUPPLIES OF FICUS RUBBER.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR:—I would ask you to be so kind as to bring me in touch with a solid American factory (no dealers) which is willing to buy *Ficus* rubber in seasons' supplies of from 10,000 to 30,000 pounds. A sample of the same I will send for their approval the moment I receive the address. Only few estates in Java produce *Ficus* rubber, most of them cultivate *Hevea brasiliensis*, so there is here practically no market for this sort of rubber. Thanking you in anticipation,

Yours very respectfully,

J. REINTS BOK.

Soerabaya, F. M. S.

RUBBER GOODS FOR AUSTRIA AND SERBIA.

William Ford Upson has been appointed Trade Commissioner to Vienna by the Bureau of Foreign and Domestic Commerce, and at an early date will proceed to his post to conduct an investigation of general commercial and economic conditions in Austria and Serbia. Mr. Upson was an officer of the American Red Cross during the war and later the American delegate to the Inter-Allied Trade Commission at Vienna and is well informed regarding conditions there. Among the many things needed by Austria and Serbia which, in his opinion, America can best supply, are rubber goods, footwear, clothing, cotton oils and fats, petroleum and its products. American capital and business acumen along broad constructive lines will be required to establish business relations.

Poisons in the Rubber Industry.

The Rash Produced by Hexamethylene-Tetramine and a Means of Prevention.

By Norman A. Shepard and Stanley Kratz

THOUGH THE OCCURRENCE OF A RASH among rubber workers has long been observed it is only recently, since the introduction of organic accelerators of vulcanization, that the skin eruption or dermatitis has been at all serious or prevalent. By 1917, however, the problem had become so general that the Rubber Section of the American Chemical Society requested its Committee on Organic Accelerators to investigate the toxic properties of the more commonly used accelerators. The report¹ of this committee which was presented in September, 1918, at the Cleveland meeting of the Society brought out the fact that most of the common accelerators had distinctly poisonous properties. The report covered aniline, paraphenylenediamine, thiocarbonyl, p-nitroso dimethylaniline and hexamethylene-tetramine; it emphasized the necessity of studying accelerators not only from the standpoint of the accelerating action but also as regards poisonous properties.

In the study of accelerators, the Firestone Research Laboratory has devoted much attention to the question of toxicity, with the purpose of finding an accelerator combining excellent acceleration with a minimum of toxic action. Knowing that many rubber companies are using hexamethylene-tetramine or "Urotropin," it was thought that a study of the toxicology of this substance would be of interest not only to ourselves, but also to those who are already using this accelerator. The investigation has been extended to cover the probable cause of its action and to find, if possible, an antidote or simple means of prevention.

The action of hexamethylene-tetramine was summarized in the Report of the Committee on Accelerators as follows:

SYMPTOMS OF POISONING.—Rash and inflammation of skin which has been in repeated contact with stock containing this material. In severe cases, blisters filled with watery fluid result.

ANTIDOTE.—Cleanliness and care in regard to clothing are the best preventatives. Change of occupation will cause the rash to disappear, leaving no permanent effects.

This description agrees closely with that taken from the United States Dispensary² in which it is stated that, "Locally, hexamethylene-tetramine is mildly irritant and feebly antiseptic. A measles-like rash with much itching has been noticed after its continuous use."

In order to study the nature of the irritation ascribed to this accelerator, the tetramine was applied in powdered form and in water solution of various concentrations to different parts of the body. Five men from the Research Laboratory were selected for these tests and applications were made on the wrist, forearm, chest and thigh. These applications were repeated several times each day for several days, yet there was no irritation or indication of rash in any case and not even the slightest itching. Thinking that possibly the perspiration might function in the production of this rash, applications were made on the feet and even under the arm-pit, where the perspiration flows most freely. Again, no action could be observed. Even applications following a very hot bath, thoroughly opening the pores and causing a typical "sweat," resulted in no irritation whatsoever.

As a result of these negative experiments, it was decided to introduce this accelerator into a factory compound in order to study its effect under actual working conditions. The workmen handling this particular experimental stock were carefully observed. At the time this test was begun the weather was

quite cool and for some time no deleterious effect was observed. However, with the approach of warmer weather the action of hexamethylene-tetramine began to manifest itself. It usually appeared first as a rash on the wrist or forearm, and in many cases was confined to these parts. The action became more pronounced, however, when really warm weather arrived; not only the forearms, but also the face and neck became involved and to such an extent in certain cases that a large portion of the face was affected, especially around the eyes. In general the inflammation was confined to the exposed parts, though occasionally it appeared on the shoulders, legs and even across the stomach. There seemed, however, to be no tendency for this rash to spread to any great extent beyond the parts which actually came in contact with the stock; the cases on the face and neck probably resulted from contact with the hands.

The dermatitis produced by contact with the stocks containing hexamethylene-tetramine was identical with that described by Kratz³ in an article on the "Control and Prevention of a Rash Among Rubber Factory Employees," though his paper mentions no particular accelerator or other substance as the cause of the rash. Quoting from this article, "The rash almost invariably the heat. This condition is closely followed by the appearance appears as a simple erythema, such as is generally attributed to of sac-containing eruptions or vesicles similar to those characteristic of ivy poisoning. These vesicles are quite small, seldom being larger than pin-heads and are grouped in varying arrangements, from being widely disseminated, to quite closely aggregated. They rarely retain their integrity for more than 48 hours, being broken by friction from the clothes or by the patients' rubbing and scratching, or, if this does not occur they soon become filled with a watery serum and rupture spontaneously in consequence of the exuded fluid."

The perspiration undoubtedly plays an important part in the production of this rash. It becomes almost epidemic with rise in temperature. Following a few hot or sultry days productive of profuse perspiration, a marked wave of rash will spread among the men handling the raw hexamethylene-tetramine stocks; a few cool days and it subsides, only to reappear again when the hot weather returns. This observation also agrees with that of Kratz, who writes, "Though the rash is most prevalent during hot weather, particularly in humid midsummer, it certainly cannot be attributed solely to the heat; nevertheless the abnormal perspiration produced by the heat undoubtedly does play a part in rendering the skin most tender and susceptible to infection. Throughout the factory the fundamental cause of the rash will probably be traced to the irritation produced by the careless handling of green stocks or liners."

On studying the situation closely for several months and during the hottest weather, a marked immunity to the action of the hexamethylene-tetramine was observed. Only a small percentage of those handling the stock was affected. One would find right next to an especially virulent case, men performing exactly the same operations and handling the same stock, absolutely free from any sign of irritation. This undoubtedly explains the negative results which were obtained in the laboratory when the strong solutions of hexamethylene-tetramine were first applied. In order to prove that the hexamethylene-tetramine was really responsible for the trouble, a patient was selected for experimentation from among those who had shown themselves susceptible to this rash. This patient had had the rash very

*THE INDIA RUBBER WORLD, Volume 57, 1917, page 145

severely for nearly two months, the hands, wrists, forearms, face and neck all being involved. The part selected for the test with the concentrated accelerator was the arm above the elbow, where the skin was perfectly clear and where the patient said he had never had any rash. An application of a 50 per cent water solution of hexamethylene-tetramine was made by moistening six plies of sterile gauze bandage with the solution and securing it with bandage and adhesive tape. This method of application was selected to insure constant contact with the skin and at the same time protect the treated spot from contamination with other substances. In the course of twenty-four hours, an eruption developed on the treated surface having all the characteristics typical of the "rubber rash." The other arm above the elbow was similarly treated, with the same result at the end of twenty-four hours. During these tests the forearms, face and neck on which the patient had previously had the rash were clearing up showing that the rash above the elbow was not due to spreading from the forearms. No more applications were made for a period of eight days, at the end of which time the skin above the elbows had returned to its normal condition. Again, hexamethylene-tetramine was applied in 50 per cent solution and again the rash was reproduced above the elbows. Two other patients susceptible to rash were similarly treated with this 50 per cent solution; in both cases a rash was produced. All these tests were conducted while the weather was warm and the patients perspired freely while working. These results were so clean cut that they left little doubt as to the irritating action of hexamethylene-tetramine.

The absence of any rash, even on the hottest days, among those who handled the cured stock was very pronounced; as far as the writers are aware, not a single case was reported. In view of the recent work of Bedford and Scott on the "Reactions of Accelerators During Vulcanization,"¹⁰ this is readily explained. These investigators have shown that hexamethylene-tetramine reacts with sulphur at the vulcanization temperature, forming among other things, hydrogen sulphide, carbon bisulphide, ammonia and a sulphocyanate.

In order to determine a suitable substance to use as a preventive, an explanation of the mechanism of the action of hexamethylene-tetramine was sought. As the occurrence of rash is closely associated with the excretion of perspiration, the possible chemical changes which might result from its action on hexamethylene-tetramine were investigated. According to Schamberg¹¹ the perspiration is normally acid; this has also been demonstrated by actual tests by the writers. It is well known that hexamethylene-tetramine is readily decomposed by acids. Hartung¹² has shown that warming with strong acids results in the formation of formaldehyde, and more recently, Ischizdu and Inouye¹³ have demonstrated that the weaker acids such as acetic, lactic and succinic acid bring about the same result; these investigators also showed that hexamethylene-tetramine is decomposed to some extent even on boiling the aqueous solution. Its use as a bladder antiseptic depends on the liberation of formaldehyde in the bladder due to the presence of acids in the urine; Suder¹⁴ has shown that when the urine is alkaline this decomposition does not take place. It seems a logical conclusion, therefore, that when hexamethylene-tetramine is absorbed by the skin, formaldehyde will be produced in the pores under the influence of the sweat acids.

The corrosive and toxic action of formaldehyde has long been known. Remington and Wood¹⁵ state that formalin is an intense local irritant both to the mucous membrane and, if in sufficient concentration, to the skin. It has been the writer's experience,

however, that the action of a solution of formaldehyde is quite different from that produced by hexamethylene-tetramine. Application of 40 per cent formalin produced a hardening of the skin followed by a scaly appearance due to cracking of the surface. This eventually peels off leaving the lower skin perfectly clear. There is no reddening of the skin, nor any itching sensation.

Formic acid on the other hand is extremely irritative to the skin. On making an application of the strong acid, severe smarting and itching occurs almost immediately, followed shortly by the production of a blister. After twenty-four hours the blister subsides and the affected spot has a pus-like appearance. A thick scab slowly forms and quite a perceptible scar remains after the sore has healed, showing that the acid burns quite deeply. The action of the formic acid resembles very much that of hexamethylene-tetramine, only very much intensified.

This study of the respective effects of formaldehyde and formic acid on the skin has led the writers to believe that the action of hexamethylene-tetramine is due to the formation of formaldehyde in the pores under the influence of the sweat acids, followed by subsequent oxidation of the aldehyde in the pores to formic acid, and that the latter is the active irritant. Though there is no proof that such an oxidation does occur in the pores of the skin such an action seems not so improbable, when it is considered that formaldehyde has been shown to be rapidly oxidized in the system, appearing in the urine as formic acid.¹⁶ The reason for the difference in action of formaldehyde as such and formaldehyde generated from hexamethylene-tetramine may be attributed to difference in absorption. Hexamethylene-tetramine is extremely soluble in water (1 part dissolves in 1.2 parts of water at 12 degrees C.) which permits of rapid absorption through the pores. Formaldehyde, on the other hand, though very soluble in water, when applied to the skin quickly hardens the surface, making it impervious to further absorption. In fact, the property of formaldehyde has been utilized for the purpose of checking excessive perspiration.¹⁷

On the assumption then that the acid of the perspiration is the primary cause of the rash, neutralization of this acid should prove an effective preventive, and furthermore, if the actual irritant is formic acid, neutralization of this would prevent its action, if it were formed. Any substance used to obtain this result should be itself non-irritating to the skin, preferably neutral in character, and sufficiently soluble in water to be easily absorbed by the skin. Sodium bicarbonate or "baking soda" meets all these requirements. It is neutral, quite soluble in water (one hundred parts of water dissolve 9.6 parts of the salt at 20 degrees C.) and non-irritating, and consequently was selected for experimentation as a preventive means.

In applying the sodium bicarbonate, the method of treatment employed consisted in first thoroughly washing the affected part with soap and water, drying and then applying a saturated solution of the bicarbonate, allowing this to dry without wiping. The thorough washing opens the pores of the skin and allows better penetration of the bicarbonate wash. On drying, a white film of the salt remains as a thin coating which adheres with surprising tenacity. Two applications daily were made, at the beginning and at the middle of the shift. Before leaving the factory the affected parts were washed and no further application made at that time.

The first patient on whom this treatment was tried responded rapidly. The solution was applied to the arms, face and neck, all of which parts were affected. In the course of a week all the rash had completely disappeared, and what was of chief interest, no new eruptions had developed. Since the weather was fairly cool during this period, it might be concluded that this was the cause of the rapid disappearance of the rash. To prove other-

¹⁶ Remington and Wood, *loc. cit.*

wise and eliminate the temperature factor, the use of the wash on the left arm was discontinued while continuing the application to all the other exposed parts; five days later the left arm, and the left arm only, was broken out with the typical rash. Thinking possibly that this might be due to more frequent contact with this arm with the stock, the treatment was omitted from the right arm and again continued on the left. Four days later an eruption appeared on the right arm, while all the other parts treated with bicarbonate were entirely free from any dermatitis. This patient used bicarbonate for a period of four weeks and during that time had no sign of rash except on the forearms when the wash was omitted as previously mentioned. Before using bicarbonate, this patient had had the rash on some exposed part of his body almost continuously for nearly three months.

A squad of ten men was selected for further tests as to the efficacy of the bicarbonate solution. These men, selected from the various departments handling this stock, had all been troubled more or less severely with rash. This squad was supplied with the bicarbonate wash and carefully observed from day to day during a period of two weeks. All, without exception, showed marked improvement; the old rash healed rapidly and no new eruption developed. During the course of these observations there were several very warm days, which brought on quite a wave of rash among those not being treated. Not one member of the squad, however, developed any rash during this hot spell.

On the strength of these results bicarbonate solution was provided, so that all the men handling the raw stock containing the hexamethylene-tetramine could obtain it if troubled with this rash. Though it was not possible to obtain as accurate data on all those applying the solution, the reports obtained from both the foremen and the men using the solution were very encouraging.

At the Eighth Annual Congress of the National Safety Council held at Cleveland on October 4, 1919, a representative of the Hood Rubber Co. stated that they had had very considerable success in combating this rash by using an aqueous solution of borax containing gum arabic. He stated that this mixture dried with some difficulty, and they had installed electric dryers to obviate this trouble. Though the writers have not had opportunity to test this treatment, they feel that the bicarbonate solution offers a much simpler treatment; it dries readily, is free from the alkaline reaction of borax and in addition costs very much less.

While it is true that the necessity for the application of any preventive or prophylactic solution such as bicarbonate of soda or borax, is a serious drawback to the use of a substance as an accelerator, it does not prohibit its use. It offers a better solution of the difficulty certainly than that offered by the Committee on Accelerators. "Change of occupation," with the entailed loss of wages and curtailed production, can scarcely be considered a satisfactory antidote, either from the standpoint of the employe or employer.

The use of the bicarbonate solution is attended with no disagreeable results. When first applied to a severe case there is considerable smarting, but this soon stops after the solution has dried and the patients report that the severe itching which always accompanies this rash is relieved within a few hours, and there is a marked improvement in the appearance of the skin after twenty-four hours. The solution can be applied to the face and neck and even around the eyes with perfect safety. This is of particular importance, as some of the most severe cases are those in which the face, especially around the eyes, is affected. A case which recently came within the observation of the writers was that of a man whose entire face was inflamed to such an extent that both eyes were completely closed. Not

only was the face affected, but also the arms, shoulders and legs. This case was so severe that it was found necessary to put the patient to bed. Four hours after the first application the inflammation had subsided, the patient stated that the itching sensation was practically gone and he was able to partially open his eyes. At the end of ten hours he was quite comfortable and slept through the entire night. This was quite remarkable for those suffering from the rash complain chiefly of being kept awake at night. Thirty hours after the first treatment he had sufficiently recovered to be discharged from the hospital.

Though the bicarbonate has an apparent curative effect, it is unquestionably chiefly preventive. The case just cited seems to contradict this, but the writers feel that the curative action was simply due to arresting the further action of the absorbed hexamethylene-tetramine. The chief interest in this treatment is the fact that further development of new rash is prevented, and the old rash is thus allowed to heal without further infection.

These observations are published with the realization that they represent the action of bicarbonate on a comparatively small number of cases, but the results seem to justify the conclusion that bicarbonate can be successfully used in controlling the hexamethylene-tetramine rash.

In presenting this paper the writers wish to acknowledge their appreciation of the cooperation of both Dr. D. V. McDonald, medical director, and John Young, chief chemist, of the Firestone Tire & Rubber Co.

WESTINGHOUSE WAR MEMORIAL SCHOLARSHIPS AWARDED.

The four annual War Memorial Scholarship awards of \$500 each, established by the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, have been announced. The following men were successful: Herbert S. Pahren, Cincinnati, Ohio, order clerk in the Cincinnati office, who has selected for his scholarship a technical engineering course at the University of Wisconsin; Arthur Marthens, East Pittsburgh, Pennsylvania, of the cost department, who has chosen a course in electrical engineering at the Carnegie Institute of Technology; Paul O. Langguth, draftsman in the engineering department at East Pittsburgh, who has selected as his award an electrical engineering course at the University of Pittsburgh, and Andrew P. Lesniak, of the production department at East Pittsburgh, who has selected a course in mechanical engineering at the University of Pittsburgh.

Two classes of scholarships are provided by the Westinghouse company:

(a) For sons of employes of the company or its subsidiaries who have been employed for five years or longer.

(b) For employes of the company and its subsidiaries who have been continuously employed for at least two years and who shall not, on September 1, have exceeded the age of 23. Not more than two class B scholarships will be awarded in any year.

Each scholarship carries with it an annual payment of \$500 for a period not to exceed four years, the payment to be applied toward an engineering education in any technical school or college selected by the successful candidate with the approval of the scholarship committee.

These scholarships have been established as a memorial to those employes of the company and its subsidiaries who entered the service of their country during the war. Four awards will be made each year.

UNITED STATES PRODUCTION OF BARYTES.

The crude barytes produced and marketed in the United States in 1918 was 155,241 short tons, one-fourth less than the quantity marketed in 1917, and one-third less than that marketed in 1916, according to statistics collected by the United States Geological Survey, Department of the Interior. The average price per ton was \$6.73, as against \$5.66 in 1917 and \$4.56 in 1916.

Job Analysis and Written Standard Practice.

By James Wright Cary.

IT USED TO BE SAID that many a manufacturer had no reliable data concerning costs. This was doubtless true to a certain extent, and perhaps is now, owing to the fact that some managers have failed to appreciate the exacting requirements of a dependable cost department. This has been especially true of new concerns, frequently composed of men who had left old established institutions, to "set up" in business for themselves, and who "carried over" data considered "near enough" to afford a working basis.

OBJECTIONABLE PIECE RATE PRACTICES.

Many such firms endeavored to institute a "cost department," making time studies of all operations, and setting piece rates. Where the method employed was crude, the results were unsatisfactory. Usually this worked out so the employee could not make a "living wage," and again he made more than the management was satisfied the work was worth. To adjust this the rate was sometimes cut down to what it was thought the workman should be allowed to earn. This practice bore the usual fruit, and distrust, dissatisfaction and inharmony established themselves in place of those conditions that are essential to the perfect working of any manufacturing establishment.

So many manufacturers committed themselves to this unscientific way of establishing piece rates, that the very term became a stench in the nostrils of the average workman, and so remains to-day in many localities. This attitude of the worker was fostered by labor organizations, and it is only of recent date that they have softened to any noticeable degree in their hostility to any factory practice that includes the use of the stop-watch and time studies as a means for arriving at a wage rate. It did not take long for a manufacturer to discover that while "setting a piece rate" was, perhaps, easy enough—in fact too easy—it was commercial suicide to "cut it down," and there are some who have been wise enough to "let the rate stand," no matter how much a workman earned, and take the load on their own shoulders where it belongs.

SCIENTIFIC TIME STUDY THE SOLUTION.

This leads, naturally, to consideration of the question: Is there a scientific way of determining just what a man or machine should produce in a given time, and thereby establishing a wage rate that will be just to workman and manufacturer alike? Scientific time study can be secured by means of written standard practice, but a distinction must be made between "standard" practice, and the experimental studies that ordinarily determine what the standard really is. Standard, therefore, is something scientifically proved.

BENCH JOB ANALYSIS.

To standardize an operation, calls for job analysis, and to analyze an operation, all the factors that enter into or effect it must be considered. Here are a few of them: consider location of workman or bench as to light, ventilation, temperature, conveniences, receipt and delivery of material, his bench, its dimensions, slope or tilt and height as adjustable to his own. Is its arrangement suited to the job; are there racks or holders for tools; are tools properly placed during work, or does operator have to reach for them; has he complete equipment, or does he have to borrow or lend? Enumerate tools and describe them. Are they made especially for this work, or selected from standard makes of knives, scissors, wrenches, hammers, nippers, etc., and simply utilized as far as they will go for this work; are they too heavy, or clumsy; do they "fit" the hand? While in use are they dropped upon the bench "hit or miss" to be

fumbled for when again required, or are they placed in a rack? Is light ample in source, quality and quantity? Is any part of the work in shadow at any time? Is the light so strong as to affect the eyes? If so, does operator wear shade, colored glasses, goggles to protect from dust or particles? Does operator stand or sit while working? If former, is standing necessary to proper production? Is work tiring? If so in what way, and to what extent? Is there an allowance for fatigue; rest periods; rest rooms? If operator can sit at option, is stool or seat adjustable to height of bench or person; is seat large enough; does it interfere with quantity or quality of work produced? Toilet and drinking facilities: are they sanitary, modern? Interference: consider elements that might interfere with maximum production; tools, bench, light, conveniences as above enumerated. Work in process: are materials supplied to operatives, or do they go for them, or wait for them? What is the length of round trip; what time do trips require? If work is delayed for any cause, give actual time involved and production lost, and calculate the loss over a given period.

MAKING RECOMMENDATIONS.

If machine operation is under consideration, a proper job analysis would note light, ventilation, temperature, conveniences, safety appliances, receipt and delivery of material, sequence in routing. Describe the machine, giving particularly details essential to parts prominent in its operation. Its "make," registered number, floor space occupied, power used, size of pulleys, belt, shafting, speeds, units of production per day or hour as now operated. Consider the personnel: number of workmen; their duties. Analyze the peculiar adaptability of each to his share of the job: size, weight, temperament, experience. Analyze the group as a whole in their efficiency. What changes would you make to secure best results, in the machine, service, management? Interference: consider elements that interfere with efficient operation: the machine itself; make, year made; is it up to present-day standards, or has it been superseded by later models? If so, in what way and to what extent? Enumerate and describe advantages in exchanging old for new. Show in what way, and how soon, such changes would pay for themselves. Consider method of service: is production curtailed on account of poor routing, defective material, non-delivery of supplies, lack of efficient care of machine? Consider factors in operation: is foreman equal to requirements; number of men married, single, native, foreign; give nationalities. Attitude of foreman to job, to factory, toward his men. How are they paid: day-work, piece-work, bonus? Is the compensation adequate to the character of the job? Are men contented? If not, give reasons. Are toilet conveniences close by; adequate? Is light abundant for the work; ventilation and drinking water what they should be? Do operatives sit or stand at their work? If they sit are the seats of right height, size, construction? Is work exhausting? If so, what provision is made for rest periods; how often, how long? Show in detail the effect on production without rest, and the result with periods of rest. Recreation: provisions for recreation. Is there a circulating library; day or night school; recreation hall; music, such as an orchestra or band; athletic club, factory restaurant, hospital and dispensary, smoking room? To what extent, if any, do the men on the job under examination avail themselves of these advantages? Give particulars as to individuals.

MAKING RECOMMENDATIONS.

The above gives an idea of what constitutes job analysis. It would be modified or elaborated to suit requirements or the specific ideas of the analyst. Having written up the history of a

job, the investigator presents his recommendations. Naturally he must be prepared to back them up, and in all probability give a practical demonstration of their value before the average management will be convinced that the new method is better than the old. Fortunate indeed is he whose recommendations call for changes in method rather than in machinery. Changes or additions in machinery involving large expenditure have to run the gauntlet of service criticism. Such authorities as Taylor, Gantt, Emerson, Thompson, Diemer and Lichtner, however, could be induced to give a manufacturing proposition their attention on no other basis than that their recommendations be immediately carried out. Their attitude toward every proposition is the scientific one. To be scientific a process must be perfected, otherwise making time studies and setting piece-work rates thereon accomplish but one-half, and the less important half, of what should be attained.

Assuming that the management stands ready to make all changes necessary to secure production according to the highest standard obtainable, the result will be seen in machines that run at proper speeds, that are properly placed, efficiently served, and can be made to produce at the minimum of cost. Studies then made to determine piece rates, if made by an engineer properly qualified for the task, will be dependable, and the facts thus secured will furnish a proper basis and the only one for "Written Standard Practice."

INSTRUCTION CARDS.

Having evolved a "standard," the next step is to put it in writing. Preferably, heavy paper or cardboard should be used and kept in a convenient file for ready reference. In conjunction therewith an instruction card is issued for the guidance of the worker. It should prescribe the tools to be used, the time established as standard for each step in the sequence of production, and the rate of pay. A drawing or photograph of the article, with dimensions, would be a valuable addition, together with all directions necessary to a thorough understanding of the work to be done. In standard practice, instruction cards are issued that they may be conformed to in all particulars, and where the article to be made is new, or the method has been changed, their proper use presupposes the special training of the worker by an instructor.

THE OBSERVER AND HIS TASK.

An observer "properly qualified for the task" is vital to the success of any plan for establishing a "written standard practice" that is worthy the name. To quote from Gantt's "Work, Wages and Profit," "Stop-watch observations done inefficiently, or with ill-adapted appliances, or by poor methods, are absurd, and serve only to bring into disrepute all work in which the stop-watch is used. Moreover, such use of the stop-watch justly excites the contempt and opposition of the workman."

First of all, the investigator should be a diplomat. His attitude toward the workman should be devoid alike of patronage or servility. He should appreciate fully the dignity and the importance of his position. He should seek, first, to secure the good will of all. Naturally he must be capable, through study and training, to make a dependable report of conditions as he finds them, backed by recommendations that will appeal alike to the workers and the management as covering changes or improvements that will work out to the distinct advantage of all.

SECURING THE COOPERATION OF THE WORKER.

If workmen have been paid by the hour, and are known to be hostile to the term "piece work," why make use of it? The declaration that the rate per hour for all sorts of work will remain undisturbed, would at once dispel any latent suspicion that the "time study man" had for his ultimate object the "cutting down" of wages. In short, it is hard to conceive of scientific management in any real sense that has not for its ultimate ob-

ject the establishing of conditions that would make it possible for the average worker to increase his earnings, conjointly with an increase in factory output. That is exactly what written standard practice, scientifically projected, would secure. Given improvements in machinery and process, how then to secure the interest and cooperation of the workers? By the introduction of incentives toward greater individual interest in the job, the department, the shop. Past records show the average daily production. Pay a substantial premium or bonus in addition to the established daily wage. Create by degrees a class of high-grade workmen, setting aside a part of the factory, where practicable, in which they would work together. This would be applicable in shoe making, tire building and other work where a large number of operatives are engaged in making some one article or performing identical tasks. Place membership in this class on so high a plane that none but the most competent may attain to it, and make their reward so large that the average man or woman will be eternally striving for admission to it. Go a step farther; give an additional bonus to all who produce nothing but first-quality goods in a given period. Do not forget the foreman. Give him a bonus for each member in his department who earns one, and a special bonus when all his workmen make a perfect score.

CHILE DEMANDING AMERICAN TIRES.

Chile is rapidly becoming a good market for American automobiles and more especially for American tires. The people have made a great deal of money during the war and the well-to-do are substituting motor cars for their carriages in the cities, to which automobiles are largely restricted owing to poor roads in Chile, which people of moderate means have discovered the conveniences of certain low-priced American cars.

The growth of United States exports to Chile has been phenomenal; in the fiscal year ended June 30, 1913, they were 78 cars, valued \$109,982, and \$2,844 worth of tires; in 1918 the figures were 220 trucks, valued \$282,638, with 3,390 passenger cars, valued \$3,576,511, and tires worth \$725,876, while for the fiscal year 1917-1918, owing to war conditions, the number of cars sank to 152 trucks, valued \$223,733, and 1,057 passenger cars, valued \$1,606,758 and the value of tires exported rose to \$1,130,873. This is due largely to the fact that the bad roads in Chile are very hard on tires. In 1913 the United States had 8 per cent of Chile's automobile trade. In 1917 its share was 95 per cent.

The largest portion of the imports go to Valparaiso, whence many are sent to Santiago and the interior, but the imports to Talcahuano, to Antofagasta and Iquique in the nitrate region and Punta Arenas at the southern point of the continent are also considerable.

UNITED STATES PARCEL POST TO DUTCH EAST INDIES AND ZANZIBAR.

Parcel post service is now in operation between the United States and the islands of the Netherlands East Indies producing rubber and gutta percha. The list of islands given out by the post office is: Bali, Banca, Billiton, Dutch Borneo, Celebes, Little Sunda, Madura, the Moluccas, Rioce, Sumatra, Dutch Timor and Dutch New Guinea.

With the outlet of Uganda, also Zanzibar and the neighboring island Pemba, there is now parcel post service, but parcels will be delivered only in the towns of Zanzibar, Chaki-Chuki, and Wei, on Pemba island.

IMPORTS OF MANUFACTURED RUBBER GOODS FOR GREAT BRITAIN AND THE islands of the Archipelago amount to about \$200,000 a year. This used to come from Germany, but is now in the hands of French and British dealers, including about \$30,000 worth of belting and \$40,000 worth of tubing of all kinds; the rest is made up of waterproof rubber shoes, pneumatic tires and air cushions.

Vulcanization by the Use of the Sulphur Reaction Product of a Nitrogen Accelerator.

BRITISH PATENT No. 130,857, recently granted, covers vulcanization of rubber by the use of the sulphur reaction product of a nitrogen accelerator.

The specification states that in the curing of rubber no practical or commercial product has ever been produced from the reaction of sulphur with caoutchouc without the aid of a nitrogen-containing body present during vulcanization. This nitrogenous body may be found in natural rubber or may be added in the process of manufacture. The absence of all nitrogen, however, gives a vulcanization product that is of no value commercially. It has been the practice to add to the rubber before vulcanization certain nitrogen bodies (accelerators), which appear to have the effect of shortening the time required to cure the product and to improve its properties.

It has been found that these nitrogen accelerators are not usually the ultimate bodies which assist in the vulcanization of caoutchouc, but that they must first react with sulphur and that the sulphur reaction product thus formed is the agent which either aids or is entirely responsible for the satisfactory vulcanization of the rubber with sulphur.

Although this principle is believed not to have been recognized heretofore, a specific example has been proposed, namely the use separately as accelerating substances, of liquid and solid products of the interaction between parinitroso-dimethyl-aniline or any of its homologs, and sulphur. The use of these particular accelerating substances is excluded from the present invention.

Vulcanization of rubber under this invention is divided into two distinct steps: first, the production of a sulphur reaction product of a nitrogen accelerator, and second, vulcanization proper, the reaction product being incorporated in the mix. A number of advantages result. For example, the temperatures used in vulcanization of caoutchouc are only occasionally and by merest coincidence, those most suitable for a reaction between sulphur and a nitrogen accelerator. In some cases, as in the use of hexamethylene-tetramine, the reaction with sulphur is violent, and produces large volumes of gas including hydrogen sulphide and other malodorous compounds, resulting in the formation of a vulcanized product which is often porous and bad smelling. In other instances the temperature of vulcanization is not sufficiently high to cause satisfactory reaction between the nitrogen accelerator and the sulphur and the accelerating effect is partly or wholly unattained. For example, carbanilide is almost inactive at the temperature corresponding to 40 pounds of steam pressure (141.4 degrees C.) while at 60 to 80 pounds pressure (153 to 162 degrees C.) it shows very valuable qualities.

By carrying out the reaction between the nitrogen accelerator and the sulphur before compounding them with rubber, the exact temperature best suited to this particular reaction may be employed and all undesirable by-product be removed before the finished reaction product is introduced into the rubber mixing. In many cases the curing value referred to the nitrogen content is more than doubled by using the sulphur reaction product of a nitrogen accelerator instead of the nitrogen accelerator itself.

A mixture by parts of sulphur 1, zinc oxide 16, and plantation pale crepe rubber 16, cures to the best product in from $2\frac{1}{2}$ to $2\frac{3}{4}$ hours at 141 degrees C. The addition of two parts of anhydro-formaldehyde-aniline (methylene-aniline) shortens the cure to about 45 minutes.

This accelerator when caused to react with aniline and sulphur forms a sulphur-nitrogen compound $1\frac{1}{4}$ parts of which used in place of the anhydro-formaldehyde-aniline in the above mix,

shortens the time of cure to 20 minutes. This shortened cure benefits the product as evidenced by higher tensile strength and higher modulus of elasticity.

By anhydro-formaldehyde-aniline (methylene-aniline) is meant the reaction product of two molecules of formaldehyde on two molecules of aniline, giving two molecules of methylene-aniline which polymerizes and may be conveniently considered a di-polymer.

EXAMPLE I.

The preferred method for producing this sulphur-nitrogen accelerator is as follows: 210 parts (one molecule) methylene-aniline and aniline are boiled under a reflux condenser for five hours at 195 to 198 degrees C. (thermometer in the liquid). The mixture is then cooled to 150 degrees C. at which point the sulphur is added. The temperature is next raised slowly to 175 degrees C. and held until 56 to 60 parts by weight (about two molecules) of hydrogen sulphide are lost. The free aniline is distilled off by steam distillation, care being taken to remove the aniline from the reaction mixture to such an extent that the product will cool to a hard brittle mass.

Thiocarbanilide or methylene-diphenyldiamine may be substituted in the foregoing example with the proper precautions and a similar product may be produced having a higher curing power than the original base. The reaction products thus obtained when dried are suitable for use in rubber mixings and show many advantageous properties as accelerators.

EXAMPLE II.

Methylene-diphenyldiamine 198 parts (one molecule); sulphur 64 parts. These ingredients are slowly melted and heated to 120 to 150 degrees C. until 34 to 36 parts (one molecule) of hydrogen sulphide has been removed. The reaction product is then steam-distilled, removing about 93 parts (one molecule) of aniline which has been produced during the reaction.

EXAMPLE III.

Methylene-aniline, 210 parts (one molecule of di-polymer); sulphur, 64 parts. The ingredients are slowly melted and then heated to 150 to 170 degrees C. until 34 parts (one molecule) of hydrogen sulphide are removed.

There is also produced some carbon di-sulphide, which may be estimated by absorption in aniline and allowed for, although this is not necessary. The product is then steam-distilled until no more aniline will come over.

EXAMPLE IV.

Straight sulphur reaction on tri-phenyl-guanidine; 287 parts tri-phenyl-guanidine; 64 parts sulphur. The mixture is heated to 225 degrees C. under reflux until 34 parts (one molecule) hydrogen sulphide is lost. The compound on cooling is ground and compounded with rubber and has the same curing power, nitrogen for nitrogen, as tri-phenyl-guanidine itself.

EXAMPLE V.

Sulphur on tri-phenyl-guanidine with 287 parts tri-phenyl-guanidine; 186 parts aniline; 64 parts sulphur. The mixture is heated gradually to 236 degrees C. until 34 parts of hydrogen sulphide has been removed. In order to raise the temperature the aniline must be partially distilled off with a simultaneous evolution of gas. When the aniline removed equals 186 parts, or nearly so, and the hydrogen sulphide has reached or passed 34 parts, the reaction is complete, and on cooling is found to be a hard reddish-brown resin having a conoidal fracture. It is equal in curing power to tri-phenyl-guanidine.

The term "nitrogen accelerators" is intended to include, with the exceptions cited above, all of those nitrogen-containing bodies

the properties of which are such that they tend to react with sulphur in a rubber mixing as the result of which vulcanization is effected or expedited. Many substances are inherently accelerators in this sense which would not be so regarded at present because their accelerating effect cannot be obtained under the temperature and other limitations of the curing process itself.

In addition to amino bodies, secondary amines and imines, such as the specific nitrogen accelerators above mentioned, nitroso bodies, except paranitroso-dimethyl-aniline and its homologs, cyanide bodies, such as sodium ferrocyanide, and proteids and

the products of their decomposition and hydrolysis, including the amino acids, and such, for instance, as animal glue or gelatine, give good results when employed according to this process.

Although in some respects advantageous to limit the amount of sulphur to that required for reaction with the nitrogen accelerator, it is permissible to admix with the nitrogen accelerator the entire amount of sulphur to be used for vulcanization. With the exception of a few above mentioned compounds, the nitrogen-containing bodies used contain the amino group or a substituted amino group.

Rubber Tariffs of North America.

MANUFACTURED RUBBER GOODS were exported in 1918 from the United States to the other countries of North America, Canada and the British Colonies, Mexico, the Central American States, Cuba and the other West Indian Islands to the amount of \$10,417,390, showing the same steady increase that marked each year of the war. The change from the fiscal year, beginning July 1 and ending June 30, to the calendar year beginning January 1 and ending December 31, renders the necessary comparisons a little awkward, for the 1918 figures are identical for six months with those for the fiscal year 1917-18. The exports in that period were \$9,707,020 which was over a million and a half more than the \$7,994,805 of 1916-17 and that exceeded by much more than two millions the \$5,664,173 of 1915-16, which in turn was nearly a million and a half more than the \$3,257,865 of 1914-15, the first year of the European war.

That figure was a little below the fairly steady average of the previous years which was something under four million dollars a year.

The chief customer of the United States in all the lines save tires was Canada which took \$4,734,351 of rubber goods; Cuba was next with \$2,486,104 and Mexico, third, with \$1,715,559; far behind followed Panama with \$287,286, Jamaica with \$165,657,

the Dominican Republic with \$145,007, while the Danish West Indies, which now belong to the United States, bring up the rear with \$14,427.

Automobile tires form the largest item of the exports, \$4,422,020; of these Cuba took \$1,454,090, Canada, \$1,278,000 and Mexico, \$999,569. For belting and hose of which \$1,552,974 was exported, Canada leads among the purchasers with \$511,381; Mexico is next with \$459,325; and Cuba, third, with \$386,069.

Druggists' rubber sundries appear in the list for the first time in 1918, when they were exported to the amount of \$412,801; previously they had been included among "other manufactures" of rubber which, with them, made up a total of \$2,815,326. Rubber boots and shoes combined were sold to the amount of 760,041 pairs worth \$1,358,372; for these Canada was by far the best customer, taking over \$900,000 worth with Newfoundland next with \$250,000; the southern countries had no call for goloshes.

The succeeding extracts from the tariffs of the principal countries of North America show the competition to which rubber manufacturers of the United States are subject under existing tariff conditions. Owing to frequent tariff changes the figures and information given below should be periodically verified and small trial shipments made to test the rates:

*Calendar year 1918.

BERMUDA.

Equivalents.—Pound Sterling, normally \$4.86.

All goods, with a few exceptions consisting of liquors, spirits, tobacco and manufactures thereof, live stock, agricultural products and provisions, meat, patent medicines, creams and lotions, are liable to import duty of 10 per cent ad valorem. In addition to this duty, a surtax is leviable equal to 10 per cent on the amount of duty payable. Goods imported on account of the local government by any officer or committee, being the property of the public or purchased at public expense, are exempt. Fire engines and all other articles imported by the Corporation of Hamilton, as part of the equipment of the Hamilton fire brigade are also exempt.

Persons exporting goods are entitled on certain conditions to the whole of the duty paid on the importation thereof when the duty on said goods amounts to 5%.

Drawbacks of duties are allowed for goods sold to and becoming the property of His Majesty's Government.

BRITISH HONDURAS.

Equivalents.—The dollar, equal to the American dollar, is the unit.

All goods, excepting certain articles of food, aerated waters, liquors, spirits, tobacco and manufactures, explosives, arms and ammunition, jewelry, lumber, certain oils, opium, perfumery, phonographs and similar articles, are liable to import duty of 15 per cent ad valorem, including the cost of packages in which they are packed. Fire extinguishing apparatus, accessories and appliances, are duty free, as are also machinery—agricultural, electrical, marine, mining and manufacturing or parts thereof, iron, boilers, belting, steam pipes, packing, lagging, fittings, batteries and charges. Unmanufactured rubber is exempt from duty on chicle there is an export duty of ½ cent per pound.

CANADA.

Equivalents.—N. o. p. represents the words "not otherwise provided for." "Per cent" represents per centum ad valorem.

The rates of customs duties, set forth in column 1, "British Preferential Tariff," apply to goods the produce or manufacture of most British colonies and provinces when imported direct from any British country. Crude rubber and balata imported from the West Indies into Canada come under the preferential tariff.

Certain French, Dutch, and Belgian goods enjoy the benefits of the intermediate tariff, among which are:

The duties are payable on gross weight, if the tariff provides that the goods are chargeable on weight without any deductions for packing receptacle. If the receptacle is liable to a higher rate of duty than its contents, it must be assessed separately. Imports shall pay inclusive of all duties, the rates leviable thereon, under the tariff, besides the quay duty of ½ centime per kilogramme. Goods which under contract or special laws are duty free, shall pay consular fees, except as to those which are expressly exempt from such fees.

Rubber is subject to an export duty of 10 per cent ad valorem.

GUATEMALA.

Equivalents.—Peso (100 centavos), 96 cents; kilo, 2.2 pounds.

Rubber goods are not specifically mentioned in the Guatemalan tariff. A decree of December 3, 1903, established a duty of 4 centavos per quintal (220 pounds) on goods removed from the Chamierico custom house. Among articles paying 11½ per cent ad valorem are mentioned pumps of iron with or without hose, for mines, fire-engines, or watering purposes. On rubber, there is an export tax amounting to 10 pesos per quintal, gross weight.

A decree dated November 13, 1895, places a duty of four centavos on each pound of rubber exported from the Department of Zelaya, District of Siquia, region of Cape Gracias a Dios.

*Tariff Nos. 1625 and 1626 include cloth covered with rubber or varnish of rubber.

PANAMA.*Equivalents*.—Balboa, 1 dollar; kilo, 2.2 pounds.

For the purpose of collecting duty, merchandise is divided into four classes:

1. Articles free from payment of the tax.
2. Among these articles are included machinery for the manufacture of rubber and articles imported by the local government.
3. Articles not specified in the first and third class will be divided into two groups, A, paying 10 per cent ad valorem, and B, paying 20 per cent ad valorem. To group A belong various kinds of provisions, oils, cement, barbed wire, hatchets and similar tools, books, printed matter not coming through the post, jute and hennepin bags.
4. All other articles belong to group B.

The 20 per cent on articles in group B will not become effective without taking into account that provided for in Article 121 of the Constitution, and after coming to an agreement with the Government of the United States in accordance with what is laid down by the Taft Convention.

5. Different kinds of spirits, alcoholic and soft drinks; passengers' baggage when its weight exceeds that established by this tariff.

SALVADOR.*Equivalents*.—Peso, nominal value 96 cents; real value about 38 cents; kilo, 2.2 pounds.

By a commercial convention between France and Salvador, France is entitled to the minimum tariff rates on rubber imported from Salvador. Among French goods entering Salvador, unspecified articles of rubber pay a duty of 6.45 peso. This tariff is also applicable to Germany. According to a law of April 4, 1911, there is an export tax on rubber amounting to 1.20 pesos per quintal, gross weight.

The import duties on all goods introduced into the ports of the Republic are increased by 20 per cent in American gold.

MEXICO.*Equivalents*.—Silver peso, 40 cents; kilo, 2.2 pounds; n. s. m., not specially mentioned.

Articles imported by the local government, charitable donations of clothing, tools, electrical and gas apparatus, bagging, printed matter; provisions, stores, etc., for government use, certain medicines, machinery, manufactures of metals, plants, educational articles—which are duty free—are liable to a duty of 10 per cent ad valorem.

BARBADOS.*Equivalents*.—Money and weights, same as Great Britain.

The general tariff places a duty of 1 1/2 per cent ad valorem on India rubber goods. The preferential tariff for Great Britain and British countries on the same articles is 9 per cent ad valorem.

All goods imported by the governor of the island or by the local government, except, also machinery belting.

JAMAICA.

All goods, other than liquors, live stock, provisions, arms and ammunition, lumber—which pay specified duties—and agricultural implements, tools, electrical and gas apparatus, bagging, printed matter; provisions, stores, etc., for government use, certain medicines, machinery, manufactures of metals, plants, educational articles—which are duty free—are liable to a duty of 10 per cent ad valorem.

TRINIDAD AND TOBAGO.

Manufactures of India rubber are subject under general tariff to a duty of 10 per cent ad valorem, while manufactures of Great Britain and British countries enjoy a preferential tariff, which puts a duty of 8 per cent ad valorem on these goods.

Balata, crude rubber, and chicle are duty-free.

CUBA.*Equivalents*.—Peso, 60 cents; kilo, 2.2 pounds.

The following surtaxes are levied on imports: 50 per cent, 33 1/3 per cent, in gourdes, and 25 per cent in gold. A law of August 26, 1909, authorizes the government to levy a further surtax of 15 per cent on the aggregate import duties.

BRAZILIAN CONSULAR INVOICE RULING REVOKED.

The American Chamber of Commerce announces a successful outcome of its fight against the adoption of the Brazilian Consular Invoice Bill, which was to go into effect October 1. The ruling provided that consular invoices should contain a clear definition of the goods shipped, instead of general terms, as previously. Upon the adoption of this rule, general designations, such as "cotton goods, not specified," "chemical products, not specified," etc., would have been prohibited. The exporter of chemicals would have been obligated to specify each product by its scientific or commercial designation. It was required that the materials composing the article or entering into its manufacture be specified. In the case of textiles it would have been necessary to state the name of fibers or materials which entered into its fabrication, such as cotton, silks, linen, etc.

In short, the requirements of the proposed rule would have placed so great a burden on American exporters that it would have discouraged firms in developing their business with Brazil, and the thanks of the export trade are due the American Chamber of Commerce for its success in bringing about the annulment of this objectionable ruling.

AMERICA'S ANNUAL TIRE BILL \$1,000,000,000.

In emphasizing the importance of more and better roads, M. O. Eldridge, director of roads of the American Automobile Association, states that forty million tires are required annually as equipment and renewals for the seven million passenger automobiles and motor trucks in use in the United States. At an average cost of \$25 each the total annual expenditure for tires is \$1,000,000,000. Hence it is high time to pay a little more attention to the effect of the various road surfaces on the motor vehicle instead of considering only the damage by the motor vehicle to the road.

TIRES DELIVERED BY AIRPLANE.

The efficacy of rush deliveries by airplane was convincingly demonstrated recently when an aviator carried a shipment of seven Diamond tires from Seattle to Everett, Washington, to fill a hurry-order. The delivery was made forty-five minutes after John K. Healy & Co., at Everett, put in a long distance call to the Seattle branch. The tires were carried on the right wing of a Boeing seaplane and were dropped directly in front of the Healy store as the plane went by.

AMERICAN MOTOR CARS AND TIRES IN THE PHILIPPINES.

In the Philippines in 1918 there were registered 4318 automobiles of 114 different makes, carrying 22,817 passengers. Trucks numbering 567, able to carry 1052 tons of goods, or 6345 passengers, were also registered. The makes were almost entirely American. As there are few railroads in the islands, automobiles are now becoming important in transporting freight, and British consuls are urging British manufacturers to compete for the business.

What the Rubber Chemists Are Doing.

The Nature of Vulcanization.¹

By Dr. H. P. Stevens.²

Part II. (Continued.)

THE ACTION OF SOLVENTS ON VULCANIZED RUBBER.

PORTIONS of the four vulcanized samples were kept for 3 months at winter temperatures and other portions for the same period in an incubator at 30 degrees C. On examining the specimens for solubility in benzene, those specimens preserved at winter temperatures were somewhat less soluble, the specimen (2) now behaving similarly to specimen (3) when originally tested. Those specimens kept at 30 degrees C. were more altered, being still less soluble; thus (1) could no longer be dissolved in benzene on standing overnight and shaking. It was found, however, that all specimens dissolved to a large extent in benzene when left long enough immersed in the solvent.

It is generally agreed that it is exceedingly difficult to remove the last traces of free sulphur from an unvulcanized mixture of rubber and sulphur. Thus the following figures were obtained on the analysis of an unvulcanized mixture of 90 parts of rubber and 10 parts of sulphur before and after extraction for one week:—before extraction, 9.84 per cent sulphur. After extraction, 0.13 and 0.12 per cent sulphur.

The unvulcanized mixture dissolved more readily in benzene than sample (1) above. A difference could be detected in the physical properties so that it may be said that sample (1) showed the effect of vulcanization to a slight degree.

SOLVENT ACTION OF BENZENE ON FULLY VULCANIZED RUBBER. Although benzene has but little solvent action on fully vulcanized rubber in the cold, I find that, by prolonged extraction of the acetone-extracted rubber in a Soxhlet at the boiling point, a considerable proportion may be dissolved. The extracted rubber tends to solidify on the sides of the flask in which the solvent is boiled, but part remains in solution. On evaporation of the benzene, the rubber remaining no longer dissolves appreciably when fresh benzene is added and set aside in the cold or the liquid boiled.³ In this respect the solution of vulcanized rubber obtained resembles that produced by the action of ultra-violet rays on a solution of raw rubber and sulphur in benzene (Helbronner and Bernstein, "*Comptes Rendu*," 1914, 158, 1343). The recovered rubber is of inferior physical properties. The following experiments were made to ascertain whether it was possible to separate vulcanized rubber into parts containing different proportions of "combined" sulphur.

Two samples of vulcanized rubber, A and B, were extracted with acetone at the boiling point for one week and the combined sulphur estimated. Parts of the extracted rubbers were dried, weighed, and similarly exhaustively extracted with benzene at the boiling point for one week. The extracted rubber was dried and weighed, and the sulphur estimated in the residue.

Benzene extract: (A) 3.08 per cent; (B) 13.7 per cent. Sulphur content of residue before benzene extraction: (A) 3.80, 3.80 per cent;⁴ (B) 8.64, 8.77 per cent. Sulphur content of residue after benzene extraction: (A) 3.85, 3.86 per cent; (B) 8.35 per cent.

It will be seen that, although an appreciable proportion of the vulcanized rubber was dissolved by the benzene, the residue of A contains the same percentage of sulphur as the original acetone-extracted rubber, and the residue of B almost as much.

The benzene extractions were now repeated with portions of the acetone-extracted rubbers, A and B, which had been put aside for 2–3 weeks in the dark. The benzene extracts were (A) 53.3 per cent; (B) 53.1 per cent.

That is to say, the benzene-soluble had increased to over 50 per cent in the course of aging. I have already drawn attention (8th International Congress of Applied Chemistry, 1910, 25, 585; "*Kolloid Zeitschrift*," 1914, 14, 96) to the rapid deterioration that rubber undergoes after it has been extracted with acetone, particularly when vulcanized. Such "perished" or "resinified" rubber is readily soluble in benzene. In the above cases the extract had the physical properties of a rubber rather than of a resin, although it underwent a further change on keeping, becoming brittle and "resinous." It was also found that, on keeping the above-mentioned acetone-extracted rubber for 5–6 weeks, it dissolved completely in benzene with the exception of a small amount of a flocculent precipitate, probably due to the protein constituent of the original rubber. The benzene solution when evaporated gave a varnish-like film, moderately hard but inelastic. Portions of the extracted rubber and the extracts of A and B were analyzed.

The extracted rubber contained (A) 3.57, 3.59 per cent; (B) 8.57, 8.38 per cent sulphur; and the benzene extracts (A) 3.34, 3.36 per cent; (B) 8.09, 8.22 per cent sulphur. In both cases the extract contained slightly less sulphur than the extracted rubber. There was also an apparent loss of sulphur during the aging of the acetone-extracted rubber. Some weeks later a portion of the acetone-extracted rubber, A, then aged and perished, was found to contain 3.32 and 3.33 per cent sulphur. These figures compare with 3.80 per cent originally present in the acetone-extracted rubber, A.

As the foregoing results show that the solubility in benzene of an acetone-extracted vulcanized rubber depends on the period that has elapsed since the rubber was subjected to extraction with acetone, it was desirable to ascertain in what degree a sample freshly extracted with acetone dissolved in benzene.

A freshly vulcanized sample of rubber, C, was extracted with acetone for one week and immediately extracted with benzene for a like period. It yielded 10.9 per cent of benzene extract. The original acetone-extracted rubber contained 3.80, 3.70 per cent of sulphur, and the benzene extract 3.68 per cent.

The residue was then immediately reextracted with acetone and gave a small extract amounting to 1.7 per cent containing 3.77, 3.82 per cent sulphur. It appeared that the process of benzene extraction, or the removal of the benzene preparatory to extraction with acetone, had produced some degradation of the rubber, as it then yielded 1.7 per cent to acetone although previously exhaustively extracted with acetone. There was no appreciable variation in the sulphur content.

A portion of the original rubber, C, was also extracted with benzene without previous acetone extraction. The extract consisted almost entirely of sulphur. The residue contained 3.90, 3.97 per cent sulphur.

These figures are a trifle higher than for the acetone-extracted rubber. The fact that very little rubber was extracted by the benzene seems to indicate that vulcanized rubber with this proportion of "combined" sulphur is almost insoluble in benzene and only dissolves when degraded or oxidized, and that such degradation takes place rapidly when exposed to air after acetone extraction or during the acetone-extraction process itself.

¹ Continued from THE INDIA RUBBER WORLD, October 1, 1919, page 22.

² Dr. H. P. Stevens in "The Journal of the Society of Chemical Industry," July 15, 1919.

³ The rubber sometimes dissolves when covered with benzene and set aside for two or three months.

⁴ Here and subsequently duplicate figures give the results of duplicate analyses.

The stability of a vulcanized rubber varies with the sulphur content of the acetone-extracted rubber, that is, the "combined" sulphur. I have shown by physical tests ("Journal of the Society of Chemical Industry," 1916, 872; 1918, 395 τ and 340 τ), that a vulcanized rubber of this type is fairly stable over a period of 2-3 years under ordinary atmospheric conditions when the coefficient* does not exceed 3. With higher coefficients, such as 6 or 7, decomposition sets in quickly, so that the rubber is brittle or "perished" in a few weeks. It was therefore of interest to compare the behavior to benzene of vulcanized rubber both with relatively low and high coefficients. A has a relatively low coefficient (about 4.3). To compare with A, a rubber, D, was taken which after one week's extraction with acetone gave 9.36, 9.42 per cent sulphur. It was placed in a desiccator for 26 days and the sulphur redetermined. Sulphur=7.41, 7.63 per cent, that is to say, an apparent loss of nearly 20 per cent of sulphur in 21 days. This compares with an apparent loss of approximately 12 per cent in several weeks for sample A.

A great part of this apparent loss is explained by an increase in weight which was found to take place while the rubber was aging.[†] To obtain uniform results, aging was carried out in an incubator at 30 degrees C. A vulcanized rubber, E, was extracted with (1) alcohol one week and acetone one week, (2) as (1) followed by benzene extraction for one week, and (3) benzene extraction only for one week. The extracted samples were dried at a low temperature for a few hours and analyzed without delay. (1) 4.05, 3.95; (2) 4.10, 3.89; (3) 3.90, 3.97 per cent sulphur. These figures show that the vulcanized rubber was in all cases exhaustively extracted and contained no sulphur soluble in organic solvents. The extracts consisted almost entirely of sulphur.

Portions of (1) and (2) were weighed after extraction and placed in the incubator at 30 degrees C. They showed the following increases in weight:—

Days Aging.	(1) Per Cent.	(2) Per Cent.
25	14.7	14.0
49	19.2	18.7

At this stage the specimens contained (1) 3.49 per cent, (2) 3.38 per cent of sulphur.

Assuming the apparent loss of sulphur to be due entirely to the increase in weight, the calculated figures would be (1) 3.35 and (2) 3.37 per cent. During aging, vulcanized rubber emits a peculiar odor and gives off acid vapors due to a trace of a volatile product containing sulphur. When passed into water, the substance is retained and the solution reduces ammoniacal silver nitrate. A trace of sulphur is therefore lost in a volatile form.

Conclusions.

- (1) No sharp distinction can be drawn between the "solubility" and "insolubility" of vulcanized rubber in organic solvents.
- (2) The more fully the rubber is vulcanized, that is, the higher the percentage of "combined" sulphur, the less is the tendency to dissolve.
- (3) Fully vulcanized rubber, such as that containing 3-4 per cent of "combined" sulphur, is almost insoluble in benzene.
- (4) Vulcanized rubber rapidly oxidizes after extraction with alcohol or acetone, and becomes soluble to an increasing extent in benzene. "Overcured" rubber with 9-10 per cent of combined sulphur oxidizes more rapidly than rubber with 3-4 per cent of combined sulphur.
- (5) Vulcanized rubber recovered from the solution in benzene becomes almost completely insoluble in benzene, provided the

*The coefficient is the percentage of combined sulphur calculated on the raw rubber present in the vulcanized rubber.

†In a similar manner a rubber not acetone-extracted but vulcanized to give a relatively high coefficient (say over 4) shows a loss of combined sulphur on aging owing to an increase in the weight of the rubber due to oxidation which accompanies "perishing." Previous acetone extraction of the rubber increases the tendency to oxidation and "perishing" and consequently the apparent loss of combined sulphur is more marked.

original rubber was not oxidized (perished). This recovered rubber possesses the nature and general physical properties of vulcanized rubber.

(6) Vulcanized rubber dissolves more readily in benzene the more it is oxidized. At the same time the recovered rubber becomes more inelastic or "resinous" and dissolves more readily in benzene.

(7) The increase in weight due to the oxidation of acetone-extracted vulcanized rubber fully accounts for the apparent loss of sulphur which takes place. But a trace of sulphur is lost in the form of a volatile product of an acid and reducing nature and containing sulphur.

(8) Extraction with benzene does not allow of the separation of a vulcanized rubber into parts vulcanized to different degrees having different coefficients.

CHEMICAL PATENTS.

THE UNITED STATES.

PROCESS OF MAKING WATERPROOFING COMPOSITIONS, comprising heating melted wax, a resinous substance, and dissolved rubber to about 305 degrees F., adding to the mass at 140 degrees F. a resinous substance dissolved in alcohol and a light hydrocarbon oil, then raising the temperature of the mass to about 180 degrees F. (the amount of light hydrocarbon oil added being sufficient to dilute the mass to the desired degree); finally adding to the mass, while at 60 to 80 degrees F., carbon bisulphide. (Guy M. Garlick, Kalamazoo, Michigan, assignor to William S. Mitchell, Gary, Indiana. United States patent No. 1,315,109.)

WATERPROOFING COMPOSITION, consisting of paraffine wax, dissolved rubber, a resinous substance dissolved in alcohol, a light hydrocarbon oil, and carbon bisulphide. (Guy M. Garlick, Kalamazoo, Michigan, assignor to William S. Mitchell, Gary, Indiana. United States patent No. 1,315,110.)

PROCESS AND PRODUCTS OF TREATING VULCANIZED OILS comprising the depolymerizing of a vulcanized oil and repolymerizing the product to a plastic material without vulcanization, producing a product that is similar in elasticity and plasticity to gum chicle. (Walter O. Snelling, Pittsburgh, Pa. United States patent No. 1,315,246.)

PROCESS OF MAKING TIRE FILLERS consisting of subjecting to vulcanization in a mold by heat and pressure a mass composed of small particles of soft rubber, rubber cement, gasoline and kerosene. (Edward F. Aycock, Midlothian, Texas. United States patent No. 1,315,652.)

IMPREGNATING FIBROUS MATERIAL. A new material for articles of footwear comprising a sheet of felted material, and a stiffening composition of resin, oxidizable oil and a drier incorporated for the purpose of making the product transpiratory. (William B. Wiegand and Walter Uffelman, Montreal, Quebec, Canada, assignors to Rubber Regenerating Co., Naugatuck, Conn. United States patent No. 1,317,340.)

THE UNITED KINGDOM.

VULCANIZING RUBBER WITH SULPHUR, accelerated by compounds resulting from the interaction of strong alkalis or strongly basic substances and monohydroxy derivatives of benzene or its derivatives. Sodium phenate is one such compound in which the hydrogen of the hydroxyl groups is replaced by the metal or equivalent radical. In others the meta or para-cresol or beta-naphthol may be the acidic group. (North British Rubber Co. and B. D. Porritt, Castle Mills, Fountainbridge, Edinburgh. British patent No. 129,798.)

VULCANIZING INDIA RUBBER IN THE COLD by alternate treatment with sulphur dioxide and hydrogen sulphide, the two gases yielding sulphur within the substance of the rubber. A solution of hydrogen disulphide in benzene may be used instead of the gas after treatment with sulphur dioxide. The process may be used for the vulcanization of rubber dissolved in a solvent

such as benzene. (S. J. Peachey, 5 Vee Tree Road, Davenport, Stockport, Chester. British patent No. 129,826.)

PUNCTURE SEALING FLUID consisting of a binding agent of rubber, sugar, and sulphite-cellulose lye or pine-tree essence or both. Earthy constituents, such as magnesia or talc, ground rice, or a solution of casein may be added. (P. Warmund, Zurich, Switzerland. British patent No. 130,342.)

THE FRENCH REPUBLIC.

PROCESS FOR INSULATION OF ELECTRICAL CONDUCTORS whereby enameling of the metallic conductor is substituted for the usual coating of tin for the protection of the insulation from the action of the copper conductor with the sulphur in the insulation. (A. Grammont. French patent No. 490,890.)

VULCANIZATION. New accelerators for vulcanizing rubber. (S. J. Peachey. French patent No. 490,965.)

KAOLINITE.

French industry is making large use of Kaolinite in the manufacture of rubber and other plastic materials. For this purpose a special quality of extreme whiteness and fineness, absolutely free from lead and iron is prepared. The specific gravity is from 2.30 to 2.40. It is recommended as a substitute wholly or in part for zinc oxide.

A CORRECTION.

Donald F. Cranor, author of the paper on "The Effect of Organic Acceleration on the Vulcanization Coefficient," read at the September meeting of the American Chemical Society, corrects the report of his paper printed in these columns in the October issue, as follows:

For the purposes of investigation the author deliberately selected a sample of brown crepe having unusually poor vulcanizing properties because such a sample best served to bring out the point which it was desired to make. The statement reported, that brown crepe will not cure satisfactorily without the use of accelerators, is not justified in view of the fact that many brown crepe lots are excellent and have good curing properties. Mr. Cranor discussed the action of the addition product of dimethylamine and carbon disulphide instead of thio-carbanilide as reported.

NEW JERSEY CHEMICAL SOCIETY PLANS INDUSTRIAL SURVEY.

At a meeting of the New Jersey Chemical Society held in Newark October 13, 1919, the plan of asking the State Commissioner of Labor to promote an official survey of state industries, and particularly the chemical industries, was considered favorably. The object is to make known to the general public the exact facts as to the natural resources of New Jersey and the extent and character of its chemical industries, and thereby to advertise New Jersey as a chemical center and encourage the consumption of American made, and especially Jersey made, products.

RUBBER AND FABRIC SHOES POPULAR.

Manufacturers of part-rubber shoes are preparing to increase their competition against leather and part-leather shoes next year. Rubber and fabric shoes have found many new friends this past season among both men and women. They have been more attractive and serviceable than formerly and the prices make them especially desirable. Very high-grade tennis shoes intended to rival leather footwear at lower prices will be brought out next summer. Heavy work shoes of rubber, fabric and fibre are rapidly finding favor, so that, the two extremes having been supplied, a serviceable shoe for wear at any time should complete the chain of good footwear provided by the rubber industry, at reasonable prices. The high cost of leather shoes also seems likely to increase the wearing of rubbers by women in order to protect such expensive footwear.

LABORATORY APPARATUS.

COMBUSTION AND DEFLAGRATION SPOON.

A SIMPLE device or laboratory tool is the combined combustion and deflagrating spoon shown in the illustration. The container or spoon is not attached but can be transferred to either

COMBUSTION AND DEFLAGRATION CONTAINER

ring of the device, permitting the use of the spoon either vertically or horizontally. (Central Scientific, 460 East Ohio Street, Chicago, Illinois.)

GAS HEATED GLASS CUTTER.

A very convenient tool for laboratory use has been devised by Lieutenant K. H. Parker, formerly of William Jewell College. It

PARKER GLASS CUTTER.

is known as the Parker glass cutter. In general appearance it resembles a hollow gas-heated soldering iron. It is attached to the gas supply by means of rubber tubing, the flow being adjusted until the flame strikes back. When sufficiently hot the cutter is used to lead a crack in the glass in any direction. A deep file cut serves as a starting point for the crack.

LABORATORY CLAMP.

The illustration shows an improved screw clamp, closed, that furnishes a flat bearing surface. It is particularly effective and convenient in service. (Central Scientific Co., 460 East Ohio street, Chicago.)

SCREW CLAMP.

AUTOMATIC BURETTE.

A simple automatic burette is shown in the accompanying figure. It is especially useful with solutions which are reduced on extended exposure to the light. At the end of a series of titrations the liquid can be run back into a bottle of dark colored glass. With ordinary solutions it will also be found useful especially in the presence of dust or fumes. It has the advantage of being filled from the bottom and regardless of the amount of solution used it is unnecessary to wait for the tube to drain.

AUTOMATIC BURETTE.

It is made from an ordinary burette. The glass stop-cock is replaced by a larger cock, the lower end of which reaches to the bottom of the bottle. The original stop-cock is lengthened by a short piece of glass tubing, sealed to the burette tube just above the larger cock and bent to form a faucet. The top of the graduated tube is fitted with a small tube to which is attached a piece of rubber tubing, which is used to draw up the liquid into the burette to any desired level. A small curved tube through the stopper regulates the pressure within the bottle. ("The Chemist-Analyst.")

RUBBER GOODS were INCLUDED IN THE LOAD OF THE FIRST Handley-Paige airplane to engage in the parcel service between Paris and London. The plane left Hounslow at noon on September 2 and the goods were delivered to the companies in Paris at 6 o'clock that afternoon.

Activities of The Rubber Association of America.

TIRE DIVISION. The joint Executive Committee of the Pneumatic and Solid Tire Manufacturers' Divisions held its regular monthly meeting at the Association offices, on October 16, there being an almost complete attendance. A docket containing a number of important subjects was disposed of.

MECHANICAL RUBBER GOODS MANUFACTURERS' DIVISION. On October 21 the regular monthly meeting of the Executive Committee of the Mechanical Rubber Goods Manufacturers' Division was held at the Yale Club.

TRAFFIC DEPARTMENT. In keeping with the custom, since the organization of the Traffic Division, to hold every third or fourth meeting at Akron for the convenience of members in that district, the Traffic Department held its regular meeting October 22 and 23 at the Akron City Club. The usual heavy docket, including many timely and important subjects, was disposed of.

Of particular interest is the completion of arrangements for personal attention to the Association's traffic and commerce questions by E. S. Ballard, an experienced commercial lawyer of the firm of Butler, Lamb, Foster & Pope, Cleveland, Ohio. This arrangement will provide a most satisfactory means for handling the legal affairs of the Association's traffic and commerce work.

NEW MEMBERS. At a meeting of the Executive Committee on September 26, the following named firms were elected to firm membership in the Association:

J. Aron & Co., Inc., 95 Wall street, New York City.

Woven Steel Hose & Rubber Co., Trenton, New Jersey.

Madison Tire & Rubber Co., Inc., 30 East 42d street, New York.

REISSUE OF THE "INDEX TO THE MANUFACTURES OF THE PRODUCTS OF THE RUBBER INDUSTRY." The work of securing a complete response to the questionnaire sent to the industry to develop the information upon which to base a reissue of the "Index to the Manufacturers of the Products of the Rubber Industry," is progressing slowly but steadily, and the Association hopes to complete the work within the very near future.

MAP SHOWING LOCATION OF FIRM MEMBERS. Last spring the Executive Committee authorized the preparation of a map to show the location of firm members of the Association over the United States, and the map is now in preparation and, when ready, copies will be distributed to Association members. It is the thought of the Executive Committee that a map of this sort will make it possible for those who may be interested to visualize quickly the rubber industry in the United States and Canada, so far as centralization and geographic location are concerned.

A COMMUNICATION FROM THE RUBBER GROWERS' ASSOCIATION, LIMITED.

New York, October 2, 1919.

To the firm members of The Rubber Association of America, Inc.:

There is attached a copy of a circular prepared by the Rubber Growers' Association, Inc., London, respecting the Rubber Uses Development Fund and the prize contest which that association has in contemplation. The circular explains itself.

The proposal of the Rubber Growers' Association was given consideration by the Executive Committee of this organization at a meeting on September 26, and I was directed to distribute copy of the circular to the entire membership of this association with the advice that if they found it convenient to make a contribution to the fund they might do so through this organization, which will transmit the total of the contributions to the Rubber Growers' Association with a statement of the donors thereof.

In the interest of ease and safety in handling the contributions it is requested that checks be made payable to The Rubber As-

sociation of America, with a statement of the purpose for which they are intended, and this office will in turn make out a check to the Rubber Growers' Association for the total.

Additional copies of the circular may be had if desired and you may be sure that this office will give every attention to any of the detail which may develop in connection with the contributions from our members to this fund.

A. L. VILES, General Manager.

THE RUBBER GROWERS' ASSOCIATION (INCORPORATED).

38 EASTCHEAP, LONDON, E. C. 3, JULY 23, 1919.

Rubber Uses Development Fund.

Dear Sir(s):

My Council have decided to open a "Rubber Uses Development Fund," for the purpose of extending the present uses or encouraging new uses of rubber, and invite contributions from members and others interested in the production of rubber.

It is desired that a minimum of £10,000 should be raised, and in the first place to inaugurate a prize scheme in the terms of the accompanying draft particulars. It is proposed to offer £5,000 in prizes; to extend about £2,000 in advertisements, and, if necessary, a sum of £3,000 upon the work entailed in receiving, investigating and adjudicating upon the suggestions sent in, and generally in any direction which might be likely to increase substantially the economic demand for the raw material.

The continued success of the plantation rubber industry will depend on the increasing demand for the commodity, and, having regard to the size of the industry and the amount of British capital involved, my council venture to express the hope that the proposals outlined above will meet with liberal response from all interested in the future welfare of the industry.

The following donations have been given or promised, subject to a minimum of £10,000 being raised:

The Rubber Growers' Association	£1,000	0	0
Messrs. Harrisons and Crosfield, Ltd.	1,000	0	0
Straits Rubber Group	1,000	0	0
Messrs. Guthrie & Co., Ltd.	200	0	0
Messrs. Edward Boustead & Co.	200	0	0
Colombo Commercial Co., Ltd.	105	0	0
Grand Central (Ceylon) Rubber Estates, Ltd.	105	0	0
London Asiatic Rubber and Produce Co.	105	0	0
Seaford Rubber Co., Ltd.	100	0	0
Rubber Estate Agency, Ltd.	52	10	0
Tavish & Rubber Estate, Ltd.	52	10	0
Batu Caves Rubber Co., Ltd.	50	0	0

Contributions or promises should be forwarded to the association as soon as possible, so that the preliminary arrangements in connection with the prize scheme can be made immediately. Any suggestions relating to the scheme, which you may care to submit, will be welcomed and will receive careful consideration.

FRANK G. SMITH, Secretary.

AND NOW TO CURB TIRE THEFTS.

Stealing automobiles has become a profitable business throughout the country and one that is carried on with far less risk than other forms of thieving involving commensurate returns.

In Massachusetts new laws to check this evil have recently become effective. The punishment for stealing, receiving or concealing motor vehicles has been made a State prison sentence of five to ten years. The life history of every motor vehicle owned in Massachusetts will now be recorded at the State House. Motor vehicle dealers of all sorts are licensed and must report all their transactions. Private owners must give to the police advance notice of intended sale. A clear title will henceforth be required as in real estate transfers. So complete will be the record and cross references that it will be extremely difficult for a stolen car to be registered again without the fact of its theft becoming known.

Stealing tires is as common as stealing cars, and it is highly profitable. Two new high-grade, non-skid, cord tires from a large car are often worth \$150 and pneumatic truck tires cost from \$120 each upward. So bold are tire thieves that they often jack up a car and remove tires from the wheels. Relatively few motorists keep a record of the serial numbers of their tires, making recovery difficult. Moreover, the tires are often rebuilt and identification marks destroyed.

With tires averaging \$25 each and running up to \$175 or more; with a car's complement of tires valued at \$100 to \$750 and thefts rapidly increasing, when will special legislation be devised to check this form of robbery?

Peace Problems and Progress.

PROPOSED CHANGES IN BRITISH PATENT LAW.

A BILL now before the British Parliament proposes to cancel the compulsory working and license clause of the Patent Act of 1907 and to substitute a series of alternative provisions. Under this bill any interested person may apply to the Comptroller, alleging that there has been an abuse of the monopoly rights under a patent and asking for relief. Five sets of circumstances are specified as constituting abuse; they are:

- (1) Non-working on a commercial scale in the United Kingdom without satisfactory reason.
 - (2) Prevention or hindering of working in the or on behalf, or with the consent of, or without effective interference by, the patentee.
 - (3) Demand for a patented article in the United Kingdom not met to an adequate extent and on reasonable terms.
 - (4) Any trade or industry prejudiced by refusal of the patentee to grant licenses on reasonable terms.
 - (5) Any trade or industry prejudiced by conditions attached to the patentee to the purchase or use of the patented article.
- The Comptroller is to be vested with remedies, also five in number, viz.:
- (1) He may endorse the patent with the words "Licenses of Right," after which anyone can obtain a license on complying with certain conditions.
 - (2) He may order the grant of a non-exclusive license to the petitioner.
 - (3) He may, in certain circumstances, order the grant of an exclusive license to the petitioner, or to some other person.
 - (4) He may revoke the patent.
 - (5) He may make no order.

The bill proposes to lengthen the life of British patents to 16 years, to restore the term of provisional protection to 9 months and extend the time for acceptance to 15 months. Patents unworkable during the war and patents of addition are dealt with. In actions for infringement patents are to be upheld for as much as is good without regard to the invalidity of any other claim in the specification. The grounds upon which opposition may be entered are also considerably extended.

A NEW GERMAN TRADE SERVICE.

The German Government has established the Foreign Trade Bureau of the German Ministry for Foreign Affairs for the purpose of gathering, assimilating, and disseminating such commercial information as may be of use to Germany in the promotion of foreign trade. A council of 25 to 30 members with Dr. Weidenfeld, formerly professor of economics at the University of Halle, as chief, will direct the affairs of the Bureau and have supreme control of all matters within its jurisdiction.

Commercial information received by the Foreign Office, the consulates and legations, will be published on the day of receipt, or if confidential will be transmitted to interested persons. Members of both the diplomatic and consular services will hereafter receive an important part of their training in the Foreign Trade Bureau.

A NATIONAL ORGANIZATION OF GERMAN INDUSTRIES.

The apparent need of industrial organization in Germany has resulted in the formation of the National Union of German Industry, to represent and promote German industries, to bring about a uniformity of action, and to create a community of interest with the workmen.

As a consequence there now exist three great groups in the country which represent the economic life and which will provide the basis for the necessary reorganization of the economic system. They are (1) the workmen's trade unions, which have been recognized by the employers; (2) the associations of employers who were more or less connected with the former Union of Manufacturers and the Federation of manufacturers; and (3) the Imperial Union of German Industry. The industries are to be divided into twenty trade groups.

It is proposed to constitute a general committee composed of 140 representatives from the trade groups, 30 from agricultural and local associations, and 10 from individual undertakings, to-

gether with 10 other persons to be suggested by the council at a general meeting. It will be seen that the scheme aims at the centralization of the representation of German industries on economic matters and in the relations between the employers and the workmen.

TAXATION AND THE HIGH COST OF LIVING.

In discussing the appointment by the Government of a non-political body of experts to study the effects of the various kinds of taxation which have been in force during and since the war, Otto H. Kahn points out in a very informing booklet that the unscientific system of taxation adopted in this country since 1917 has played a considerable part in boosting prices to their present excessively high levels. His belief that the entire matter of excess profits and income taxes should be subjected to unprejudiced and competent critical review with the idea of making recommendations to Congress finds approval in many quarters, and most financial experts agree that a general staff on economic and financial strategy during the reconstruction period would prove as beneficial as the Army and Navy boards of experts have in wartime.

THE WORKERS' SHARE OF PROFIT AND RESPONSIBILITY.

Profits without responsibility appears to be the workingman's idea of the so-called partnership plan now advocated by organized labor. A voice in management is demanded which permits the workers to determine practically their own wages and hours, and also to distribute profits without bringing to the combination any responsibility, either financial, legal or moral. This means complete unionization, domination and control of industry, and under such a régime industry will die.

There is much to be recommended in a co-partnership between capital and labor, but it must be a real partnership in every sense, with labor bearing its share of the responsibility. Profit-sharing is really the crux of the matter, and the plan being advocated by George W. Perkins benefits both employer and employee, eliminating those features of profit-sharing which have made it a failure in numerous instances.

Assuming that every business must, first of all, earn operating expenses, depreciation and a fair return on honest capitalization, and that the compensation paid to employees is for the purpose of earning enough to meet their obligations, he proposes that any profits over and above such sum be divided on some fair percentage basis between the capital used and the employees engaged, in the latter case according to the compensation of the individual worker. That these profits may remain in the business a reasonable time, he proposes that capital's share be carried to surplus, and that labor's share take some form of security representing an interest in the business to be held for three to five years. Thus an interest and responsibility on the part of labor is created and the baneful effects of profit-sharing on a cash basis are eliminated. Such a plan has already proved successful in several instances; it is eminently fair, and it represents the limit of safety in any partnership between capital and labor.

A BRITISH ESTIMATE OF RUBBER ACREAGE.

Addressing the Rubber Plantations Investment Trust in London lately, the chairman, Mr. G. Croll, estimated that the area of land under plantation rubber at the end of December, 1918, was 2,750,000 acres, which on a basis of 400 pounds an acre should yield 500,000 tons of rubber a year. He had hoped that a use would be found first from the growth of the automobile industry in the United States, where 1,000,000 cars were registered in 1913; 2,250,000 in 1916 and, according to the "Board of Trade Journal," 6,000,000 in July, 1919.

New Machines and Appliances.

ELECTRICALLY DRIVEN CALENDER AND MIXERS EQUIPPED
WITH SAFETY DEVICES.

ONE of the first considerations of the rubber engineer in equipping a modern plant is the selection of motors, controllers, and safety devices to secure maximum protection to the workmen and uniformity of finished product.

In the typical installation here shown small constant speed squirrel-cage motors, not requiring any special control apparatus, are used for most of the machines; the three-roll calender, however, necessitated an adjustable speed, direct-current motor, special automatic controller, and certain safety features; while the three mixing mills are driven by a slip-ring motor, the liability of accident being reduced to a minimum through the installation of a magnetic clutch and brake operated by safety release switches.

Direct current is furnished to the calender motor by a motor-generator set consisting of a three-phase, 220-volt alternating-current motor and two direct-current generators. A three-wire, double voltage system is used with the two generators connected in series. The calender motor is supplied with either 230 volts by using the combined voltage of both generators, or 115 volts by using either generator singly. By means of the double voltage system and a field rheostat, a 4 to 1 speed ratio is obtained with the motor, and fine variation may be had at all speeds.

The motor is started by a push-button switch located conveniently on the calender. It is stopped by the slight movement of either of two cradle-operated switches situated on each side of the calender, or by a push-button safety switch or a push-button master switch, both of which are mounted on the calender. Each cradle has three positions, namely, horizontal, up, and down. The horizontal is the running position, the down

The three mixing mills, which do not require speed variation, are driven from one line shaft, by a 200-h.-p. slip-ring motor. By using sliding pinions for engaging the large gear wheels of each mixing machine, any of the mixing mills can be thrown out of gear when their service is not needed, but this method of stopping is too slow to be of any value as a safety device. The best

MAGNETIC CLUTCH AND BRAKE BETWEEN MOTOR AND MIXERS
OPERATED BY RELEASE SWITCHES.

provision for safety would require that any mill in the line could be stopped quickly by some means within easy reach of each operator.

These requirements were met by inserting a magnetic clutch and brake on the line shaft between the motor and the first mill. Each mill is provided with cradle-operated switches for breaking the circuit energizing the magnetic clutch. Attached to the shaft on the side of the clutch next to the mills is a brake wheel which receives the brake band, which is tightened by the falling of a weight when magnetically released by the operation of one of the cradle switches. Therefore, the braking action is positive, and an accidental interruption of the circuit results in a safe condition. The instant one of the cradles is moved, the clutch is released and the brake applied. (The Cutler-Hammer Manufacturing Co., Milwaukee, Wisconsin.)

RUBBER SOLUTION AND CEMENT MIXER.

THE EIMCO CEMENT CHURN.

Rubber cement making has grown in importance and volume during recent years, resulting in the development of special churns designed to reduce the working time and improve the product. For example the mixer here pictured is a strong, heavily built machine designed to stand hard work and the strain of high speed. The mixing tank is of cylindrical type and made of heavy boiler plate. It has a hinged cast-iron man-hole cover which makes the machine absolutely gas-tight and prevents the escape of solvent fumes.

A special patented agitator is one of the features which it is claimed reduces by one-half the time required to mix the product and also greatly improves the quality. The agitator is so designed that it scrapes every inch of the interior of the mixing tank; brings all of the solution into treatment and prevents any of the material from collecting in the corners, thus keeping the inside of the tank clean.

The speed arrangement permits using a slow mixing action at the start and an exceedingly high speed to finish the opera-

MAGNETIC CONTROL BOARD FOR CALENDERS.

effects an ordinary service stop, while an upward movement causes a quick stop by dynamic braking, accomplished by short-circuiting the motor armature through a resistance. The change from one voltage to the other is made by operating a push-button switch on the control board. The motor field rheostat, which is mounted on the left of the control board, is adjusted by hand, and is short-circuited by a push-button switch on the controller, thus allowing two different speeds—fast and slow—for each setting of the rheostat. The motor can be run in either direction by means of a reversing switch on the control board.

tion. This is another feature that helps materially to reduce the operating time.

The illustration shows the machine set up for operation and the type of agitator used in machines of 300 to 1,000 gallons capacity.

These machines are built in various sizes and types with single and double agitators to meet all requirements. Tilting trough

THE EIMCO CEMENT CHURN.

types are constructed with capacities of 50 to 200 gallons and are tilted to discharge their contents. The cylindrical or non-tilting types of 50 to 1,000 gallons capacity are discharged through bottom gates. (The East Iron & Machine Co., Lima, Ohio.)

TWO-HEAD VERTICAL STRANDING MACHINE.

The accompanying illustration represents a 30-reel two-head vertical stranding machine for stranding copper wires from No. 28 to No. 36 B. & S. gage. It is designed to take metal spools $3\frac{3}{4}$ by 2 $\frac{1}{2}$ inches, on which the manufacturers ship the wire, thus doing away with respooling. The lower head carries 12 reels and the upper head 18 reels. The heads are arranged to run in opposite directions at a ratio of 4 to 5, and also in the same direction at the same speed.

VERTICAL STRANDING MACHINE.

The machine is driven by tight and loose pulleys, and is equipped with a stop motion which stops the machine when any wire breaks or the reels run out. The tight and loose pulleys are 6 by $1\frac{1}{2}$ inches and run 325 r.p.m. This gives a speed of the lower disk of 215 r.p.m. and that of the upper disk 175 r.p.m. The take-up sheave is 8 inches in diameter, and a complete set of change gears is provided for different lays. The bench space of the machine is 2 feet 8 inches by 1 foot 9 inches. (New England Butt Co., Providence, Rhode Island.)

RODLESS HYDRAULIC VULCANIZING PRESS.

The rodless hydraulic press has been perfected to overcome the defects of the old style presses with threaded rods on which the nuts are constantly working loose, thereby throwing the

platens out of parallel, injuring the work, and forcing two of the rods to bear the entire load.

In the rodless press the cylinder, cheek pieces and top head are one solid open-hearth steel casting. The cylinder and lower face of the top head are machined at one setting, thus insuring perfectly parallel surfaces between the platens. This construction secures absolute rigidity as there are no parts to work loose. Another improvement over the ordinary press is found in the copper-lined cylinder which makes a perfect surface for the packing of the ram to slide upon. Without this copper lining the cylinder and ram in a short time become corroded and rapidly wear out the packing requiring frequent replacement.

RODLESS PRESS VULCANIZER.

Where the platens are steam-heated, cooling ribs are cast upon those that contact with the head and ram platens, thus preventing overheating of the top head and ram.

To vary the opening of a rod-press, dependence is placed on adjustment of nuts on the rods. In the rodless construction a series of rings is placed between the top plate and the head. These are made in multiples of an inch, are instantly removable, and without adjustment the plates must come parallel. (The Charles Burroughs Co., 141 Commercial street, Newark, New Jersey.)

A NOVEL RUBBER CEMENT DISPENSER.

The rubber cement dispenser here shown has been recently perfected and will undoubtedly become popular with users of rubber cement, due to the saving of labor and conservation of cement obtained by the construction of this device.

THE McNUTT CEMENT CONTAINER.

These containers, ranging in capacity from one-half pint to one gallon, may be filled in the usual manner and closed by a screw cap, thus keeping the contents in good condition until used. The cement feeds from the bottom of the container to the brush cup, thereby permitting the use of settling compounds with uniform results, avoiding the waste common to ordinary containers.

The brush is protected by being immersed in the cement when not in use and a disk that prevents the cement from reaching the handle of the brush, acts as a cover to the cement cup. (W. H. McNutt, 83 Chambers street, New York City.)

Index to "Rubber Machinery" will be sent free upon request.

MACHINERY PATENTS.

MACHINE FOR IMPREGNATING TIRE FABRIC.

TIRE fabric is subjected to vacuum and then passes by means of a channel through an impregnating chamber containing rubber solution that forms a seal for the channel.

TIRE FABRIC IMPREGNATOR.

A vertical section of the apparatus is here shown, A being the vacuum chamber enclosing the fabric-roll B, and C is the channel communicating with D, the solution tank, E indicates the drying rolls and F the fabric wind up roller.

In operation, the free end of the fabric is fastened to a cross-bar attached to a pair of metal ribbons, the ends of which are coiled on roll G, the other ends passing downward through the channel and impregnating tank and are attached to the roll H, which is revolved by hand, threading the fabric through the apparatus. The fabric is then attached to the apron I which carries it between the drying rolls and finally to the wind-up roll.

(John E. Thropp and Peter D. Thropp, assignors to the Delaski and Thropp Circular Woven Tire Co., all of Trenton, New Jersey. United States patent No. 1,312,878.)

MACHINE FOR SPLITTING EXTRUDED DOUBLE SOLID TIRES.

The double tire A shaped by extrusion through a die is fed along a roller track B by profiled rollers C and CX and severed longitudinally by a rotating disk E working in a guard F. This is provided with extensions adapted to divert the severed sections through a right angle to facilitate their delivery on roller tracks I, J by a roller G and coating weighted roller H.

SOLID TIRE SPLITTING MACHINE.

The rollers C and CX may be replaceable or mounted for lateral adjustment. Water may be supplied to the cutter E to facilitate cutting, and the cutter may be

laterally adjustable or replaced by a hand knife. (Dunlop Rubber Co., C. Macbeth, and H. Willshaw, 114 Regent street, Westminster, England. British patent No. 130,116.)

New Goods and Specialties.

FOR THE PROTECTION OF LINEMEN.

TO MEET THE DEMAND from linemen for rubber articles to aid them in protecting themselves from electric wires, makers of rubber goods are constantly developing new ideas. Certain standard goods come to be required and others are much in demand. A new item is shown in the accompanying illustration. It is made of three layers of rubber and two of canvas arranged alternately, with the canvas layers laid crosswise with respect to each other. This trough is shaped to fit over live wires for insulation purposes. Two hard rubber rings, slotted, with an opening sufficiently large to admit the wire, serve to clamp the shield securely to it. Each shield is subjected to a submerged test of 30,000 volts of electricity before leaving the factory. The device can be applied in other ways as well as over wires. It may be used on the cross-piece or elsewhere, since it opens out easily when required. (Mathias-Hart Co., 516 Atlantic avenue, Boston, Massachusetts.)

LINEMAN'S PROTECTOR.

KENYON LIFE-SAVING SUIT.

One of the newest designs in life-saving suits is shown here. It consists of a suit of rubberized material provided with the usual weighted feet, mittens in one with the sleeves, etc., but the novel feature, of which little appears in the picture, consists of two wing-like extensions back of the shoulders, which when inflated, form the buoyant portion of the suit. The suit is open at the top and is drawn up with a strap as indicated. This design has been patented. (C. Kenyon Co., 754 Pacific street, Brooklyn, New York.)

CORD TIRE OF NOVEL DESIGN.

The growing popularity of cord tires has resulted in many new designs being put on the market. Some of these are decidedly novel, with the design cut into the tread so as to provide a non-skid feature. The one illustrated has a side-wall especially prepared to withstand abrasion, rut wear, and the steel cables in the beads are separately insulated. The breaker strip is of heavy impregnated fabric. (The Rubber Products Co., Barberton, Ohio.)

"STRONGHOLD" CORD TIRE.

AUTO BABY CRIB.

GORDON MOTOR CRIB.

A crib for the tiny tot is illustrated here, which is eminently convenient, safe, and practical, and may be attached to the robe

rail or rear of the front seat of an automobile. It is made of durable tan cloth fitted to a frame of black enameled steel, and is trimmed with a finish of fabric leather of the rubberized type. The crib is 32 by 14 inches in size and is steadied by a spring which attaches to the back seat or floor of the car. By means of

this spring, also, the crib can be adjusted for children of different weights

up to two years of age. There is also a hood that is adjustable, to protect the child from sun, rain,

and wind. With a crib of this kind the mother can drive her own car if she so desires, while the baby is near enough to be within reach of her hand. By unsnapping the understrap and

loosening two thumb-screws, the crib may be folded against the back of the seat when unused, yet remain attached to the car ready for immediate adjustment. (Gordon Motor Crib Co., 27 West So. Water street, Chicago, Illinois.)

"FITWELL" BABY PANTS.

The "feelers" or antennae of the snail are of rubber with painted tips. This adds one more member to the family of "crawling bugs." (Animate Toy Co., 31 East 17th street, New York.)

TIGER SNAIL OF AUSTRALIA.

A manufacturer of toys has devised a representation of the tiger snail of Australia. It is made of metal with wind-up device by which it can be made to crawl on almost any smooth surface. This wind-up device is patented. (The "feelers" or antennae of the snail are of rubber with painted tips. This adds one more member to the family of "crawling bugs." (Animate Toy Co., 31 East 17th street, New York.)

AUSTRALIAN TIGER SNAIL.

"UTILITY FITWELL" BABY PANTS.

Another style of adjustable baby pants is pictured above. It has no buttons and requires no pinning or sewing, being adjusted by means of a buckled strap at the waist and drawstrings at the knees. This is made of waterproof fabric and also of rubber only. (Stern Specialty Co., 40 East 22d Street, New York.)

NEW WATERPROOF CAPE.

Women's single-texture waterproof capes are now popular in England. They are made with very wide skirts, sometimes as much as 112 inches, with only one seam. The favorite shades are biscuit, dull stone, or light mole, which afford a good contrast for the braiding on the deep, square collar. There are slits for the hands, finished with laps, and the fastening is accomplished by means of buttons and button-holes widely spaced the entire length. These capes are worn 46 or 48 inches long and afford thoroughly practical protection from bad weather

("The India Rubber Journal") ENGLISH RAIN CAPE.

THE "LINE-A-TIME" HELPS THE COPYIST.

A new device for holding note-books, copy, etc., for the convenience of the typist, has been developed as illustrated below. From the side supporting arm held in place by a single screw inserted beside the typewriter in the table or desk, rise side rods

"LINE-A-TIME" COPY HOLDER.

which support the plate on which the copy rests. A stationary bar bears against the note-book below the line of copy while another cross-bar on which are rubber rollers further assists in holding the copy in place. A coiled spring which stretches across at the top holds back the pages used. At the bottom, within easy reach of the right hand, is a screw for adjusting the line spacing to the requirements of the particular copy being used. The copy or note-book is then raised a line at a time as required, the line of copy being practically on a level with the eyes of the operator. The accessory has rubber feet and rubber to decrease noise and otherwise facilitate operation. (The Line-a-Time Manufacturing Co., Rochester, New York.)

GORED STORM RUBBER.

Among the standard lines of overshoes for men and women, a most popular one is the "storm" pattern, with a high back, a comparatively low quarter, and a vamp coming up high over the instep, the whole following closely the lines of a "Romeo" slipper. A style of rubber which combines this shape with that of a sandal is, to all intents and purposes, a "storm" with the side space filled in with a thinner gore acting like the elastic web of a "Congress" shoe. The style shown here has the extension heel which, besides strengthening the most vulnerable point of a rubber overshoe, also serves as a "self-

GORED STORM RUBBER.

acting" heel when removing the rubber. (Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, Canada.)

TO MINIMIZE PUNCTURES.

An inner tire which will tend to decrease the number of punctures and give additional mileage to tires is represented

THE "AIR-CONTAINER."

by the "Air Container" shown in cross-section above. This is built of cord and rubber and, it is claimed, will not deflate when punctured. (The Air Container Co., Inc., Boston, Massachusetts.)

NEW HEEL WITH PNEUMATIC INSERTS.

By means of a newly invented electrical machine, leather heels are transformed into non-slip pneumatic ones by inserting pieces of rubber which project slightly below the surface and prevent the leather from coming into contact with hard pavements. Any ordinary leather heel may be so treated. It is the intention of the inventor to place these machines in shoe stores, so that heels may be equipped with these pneumatic inserts at the time of purchase, if the buyer so desires. (Pneumatic Shoe Heel Machinery Co., Inc., 1133 Broadway, New York City.)

PNEUMATIC HEEL.

THE "COLONEL" GOLF BALL DIMPLED.

The popular "Colonel" golf ball, formerly made in meshed marking only, is now to be had in dimple marking, also, in various weights. The "Colonel 30" is the name of an entirely new weight in the dimpled marking. (The St. Mungo Manufacturing Co. of America, 121 Sylvan avenue, Newark, New Jersey.)

A TIRE OF CLASSIC DESIGN.

Among the new tires appear some treats with adaptations of conventional classic designs. The "Trojan," shown here, is of this type. It is made in the 30 by 3½-inch size. (Sterling Tire Corp., Rutherford, New Jersey.)

"TROJAN" TIRE.

STEAMSHIP MAIL BY FLYING BOAT.

To demonstrate the possibility of delivering belated mail to vessels at sea, the "Popular Science Monthly," New York City, arranged recently for dropping a rubberized mail bag like that described in THE INDIA RUBBER WORLD, August 1, 1919, from a flying boat to the *Adriatic*, two hours out of New York, in the Ambrose channel. The mail pouch, in an outer container, was attached to a steel airplane cable 200 feet long, having rubber shock absorbers inserted near the juncture point. Two-pound bags of shot were attached to each of seven divisions at the other end. These wrapped themselves around the stay from the foremast to the fore mainmast, jerking the mail bag from its chute into the water, from which it was pulled to the bridge by its own cable.

RUBBER MAT FOR RUNNING BOARDS.

A new mat for the running board of automobiles is made of a special rubber composition reinforced with impregnated fabric at the outside edges. This causes it to lie flat. Copper-plated washers are embedded in the rubber to support fastening bolts or screws. A patent is pending on this "Hipco" mat. (Hipco Manufacturing Co., 34 Columbus avenue, Boston, Massachusetts.)

"HIPCO" RUNNING BOARD MAT.

GAS MASK FOR CHEMICAL FUMES.

A new rubberized khaki gas mask has been patented which, it is claimed, will withstand rough handling and the heaviest chemical fumes. It also protects the wearer against dust, gases, and smoke as well as against fumes. The construction is different from the ordinary muzzle respirator, ear-loops holding the device in place.

"DIAMOND" FUME MASK.

The apron is made of rubberized fabric, in gray, and comes packed in an individual envelope under the trade-mark "Ritz" enclosed in a diamond. This apron can be cleaned with warm water and soap but should not be rubbed and should be dried by hanging in some place that is not hot.

TOOL KIT FOR VULCANIZING.

One of the mail-order companies includes in its catalog a tool kit consisting of eight especially designed tools for use in tire repairing. The set, packed in a leather case for rolling up, includes a roller, plug pliers, a probe, rubber roughener, cement brush, shear snips, a knife, and a stitcher.

(Charles William Stores, Brooklyn New York.)

A MOLDED CORD TIRE.

A tire which has, it is claimed, the best features of the plain, ribbed, and non-skid tires, is represented in the accompanying illustration.

CLASSIC.

they are outdistancing them in the beauty and variety of design and in the quality of workmanship of the finished product.

As an example of this equality a five-strap sandal is here shown. Designed on artistic lines, the shoe commends itself

for its beauty, while in finish and workmanship it is of the best. The upper is of white duck, the seams as well as the edges being bound with piping. The buttons are of white agate. The sole and heel, of white rubber, are joined to the upper with a neat, narrow foxing. The heel is low, being especially appropriate for growing girls, misses, and children, for which trade the sandal is intended.

(The Columbus Rubber Co., of Montreal, Limited, Montreal, Quebec, Can.

(The Columbus Rubber Co., of Montreal, Limited, Montreal, Quebec, Can.

"Aero" INNER TIRE.

A CUSHION INNER TIRE.

An inner tire that contains numberless cells or pores filled with air, like a sponge, tends to eliminate the liability to punctures and blow-outs. The "Aero" cushion tire shown here in cross-section is so made from Para rubber, molded to fit the casing. This cushion inner tire takes the place of the usual pneumatic tube and can be used with any make of casing or rim. This type of inner tire is made for bicycles as well as for automobiles. (Aero-Cushion Inner Tire and Rubber Co., 909 Ford Building, Detroit, Mich.)

CONVENIENT FOUNTAIN PENS.

A convenient design in fountain pens has been produced that has a metal cap on the end of the pen and this cap, in turn, is fitted with a ring for attaching to a watch chain. When the pen cap is in place, secured by screw-threads, the pen can be placed in the pocket with the assurance that it cannot slip out without attracting the notice of the wearer.

"MERCHANT" Writing Set.

This kind of pen may be obtained in a number of different designs in order to suit all tastes, some being ornamented with silver and gold mounting. In addition, one style included in the "Merchant" writing set comes in rolled gold, 14-karat gold, or sterling silver, with collapsible pencil to match, both having the ring in the end. Both the pen and pencil in this set are provided with tubes containing, respectively, ink tablets and extra leads. A different model is made with a self-filling lever. (The U. S. Victor Fountain Pen Co., Inc., successor to United States Fountain Pen Co., 115 Worth street, New York City.)

"VICTOR" COLLAPSIBLE FOUNTAIN PEN.

ADJUSTABLE RUBBER CURVE-RULERS.

Those who use drawing instruments will appreciate the convenience of these rubber curve-rulers. Two are of black and

"DAVENPORT" ADJUSTABLE CURVE-RULERS

white rubber, respectively, sliding between steel ribbons, and the third has a square lead bar sliding similarly, the whole rubber-covered. (F. Winthrop Davenport, Providence, R. I.)

"MILADI-DAINTIE" APRON.

A new apron for the maid or housewife takes the form of a dainty one with a bib, designed like the customary maid's apron, with a round apron part with a patch pocket for small articles.

BRAENDER CORD TIRE.

A CLASSIC SANDAL.

In the manufacture of rubber-soled, fabric-upper footwear, the producers are not simply approaching their rivals, the leather shoe manufacturers, they are already abreast of them in the race for business, and in some lines

United States Commerce in Crude Rubber for Calendar Year 1918.

THE DECISION OF THE TREASURY DEPARTMENT TO MAKE OUT ITS annual returns according to the calendar year, from January to December inclusive, instead of the fiscal year, from June 30 to June 30, which had been the rule for many years, will make statistical comparisons and the inferences drawn from them liable to some degree of inaccuracy. In the returns for the calendar year 1918, the figures for the first six months ended June 30, have already been used for the returns of the fiscal year 1917-1918, so that in using the figures it must be remembered that for six months they are identical in both annual reports.

CRUDE RUBBER IMPORTS.

For the calendar year 1918 the imports of crude rubber were 325,959,308 pounds, a falling off of over 60,000,000 pounds from 1917-1918, which was a record year for rubber importation. The value of the rubber was \$146,378,313, nearly 60,000,000 less than in 1917-18. From the Far East, now the main source of rubber, the United States imported in 1918, 268,710,068 pounds, valued at \$125,005,308, as against 312,322,887, valued at \$169,086,900 in 1917-18. From the Straits Settlements came 198,904,100 pounds compared with 221,389,870 pounds, from British India 9,248,210 pounds, from the other British possessions 19,543,495 pounds, from Hong Kong 562,717 pounds, and from the Dutch East Indies 37,344,813 pounds as compared with the 53,663,857 pounds for 1917-18. From the French possessions came 15,680 pounds, from China 559,658 pounds, as against 11,763 pounds, and from Japan a like notable increase, 2,529,395 pounds as against 61,160 pounds in 1917-18. It is interesting to note that the Philippines sent 666,012 pounds in 1918 and only 80,644 in 1917-18.

The second source of rubber is South America. Brazil sent 40,332,620 pounds, value \$13,378,588, in 1918, and 41,277,914 pounds, value \$14,307,158, in 1917-18; Peru sent 1,373,751; Colombia, 884,792; Argentina, 390,734; Ecuador, 244,521; Venezuela, 158,857, and British and Dutch Guiana, 53,477 pounds, in each case a marked falling off. The imports from Bolivia were 474,781 pounds in 1918.

Third among the producers was Mexico, the imports being 2,185,809 pounds compared to 1,033,087 pounds for 1917-18. The imports from Panama were 164,445 pounds, from Nicaragua 158,140 pounds, from the other Central American states 64,489 pounds. From the West Indies came 51,680 pounds, as against 69,352 in the previous period. Cuba sent 4,390 pounds. The imports from Africa increased slightly in 1918; from British possessions came 76,264 pounds instead of 28,454 pounds, and from Portuguese possessions 22,622 pounds instead of 38,414.

The other countries produce no rubber but act as middlemen for their own possessions and others. From Great Britain, the United States imported 6,627,165 pounds in the calendar year 1918 and 21,926,943 pounds in the 1917-1918 period; from Portugal came 424,424 pounds in 1918; from France 160,318 pounds, and from Canada 2,712,336 pounds, compared with 4,247,287 pounds for 1917-18.

IMPORTS BY CUSTOMS DISTRICT.

There was some shifting in the amounts received by the various customs districts: New York with 119,664,398 pounds, value \$49,381,919, in 1918, showed a marked falling off from the 171,643,218 pounds and the \$83,365,120 of 1917-18. Washington, which means Seattle and Tacoma, received 109,557,617 pounds, value \$51,099,147, a slightly higher price than the New York rubber; San Francisco received 53,063,123 pounds worth \$28,445,675, as against 80,907,215, a distinct decline in quantity; Buffalo fell to 693,490 pounds, Michigan to 336,194 pounds, Southern California to 78,345 pounds, New Orleans to 10,650 pounds.

On the other hand, Ohio rose to 19,157,829 pounds as compared

with 12,944,474; Massachusetts to 10,222,733 pounds, compared with 4,327,090 pounds; Dakota to 6,008,636, compared with 3,471,093; Vermont 4,095,971 pounds, compared with 3,471,093; San Antonio 808,372 pounds, compared with 33,193 pounds, and Chicago 1,297,791 pounds, compared with 809,095. Philadelphia's 31,480 pounds and St. Lawrence's 487,934 pounds are also increases. Omaha with 48,445 pounds and Pittsburgh with 96,732 pounds, are added to the list this year while Florida is left out. The figures show the distribution of the rubber according to the official ports of entry; they throw little light on the statistics of the ports where the crude rubber was actually landed.

CRUDE RUBBER EXPORTS.

Crude rubber was exported from the United States in 1918 to the amount of 6,150,755 pounds, value \$3,133,622. Of this, 5,568,816 pounds went to Canada, 227,125 pounds to Australia, 229,790 pounds to Cuba, and 123,395 pounds to England. The amount reexported in 1917-18 was 8,208,280 pounds, and in the year before, 12,355,898 pounds.

GUTTA PERCHA.

Gutta percha was imported into the United States during 1918 to the amount of 1,207,986 pounds, value \$225,922; of this, 354,794 pounds came from the British East Indies, 306,241 pounds from the Dutch East Indies, and 524,160 pounds from British Africa. The amount imported in 1917-18 was 1,151,312 pounds. This year 470,478 pounds came in at New York, 501,760 pounds at New Orleans, 228,696 at the Washington ports, and the remnant at San Francisco. To England, too, went 126,731 pounds of crude gutta percha.

GUAYULE.

Guayule amounting to 1,376,085 pounds, worth \$413,484, came into the United States in 1918, 1,371,385 pounds from Mexico, the rest from Colombia. Almost all, 1,323,435 pounds, entered at San Antonio, Texas; 47,950 pounds at El Paso; 4,700 pounds at New York; 9,778 pounds of this was reexported to Canada. In 1917-18 the imports of guayule were 4,307,539 pounds.

BALATA.

The imports of balata in 1918 were 1,547,338 pounds, value \$836,383, as compared with the 2,449,881 pounds and \$1,278,610 of 1917-1918 and the 3,287,445 pounds and \$1,649,452 of 1916-17, a steady decline. It all came to New York; 535,065 pounds from Panama, 316,520 pounds from Colombia, 260,491 pounds from Venezuela, 218,868 pounds from British Guiana, 120,078 pounds from Dutch Guiana, 32,814 pounds from the Dutch West Indies, 53,883 pounds from Trinidad and Tobago, 7,619 pounds from Brazil, and 2,000 pounds from Ecuador. Exports were: 652,902 pounds to Great Britain, 9,639 pounds to Canada, 43,644 pounds to Japan, and 5,000 pounds to Greece. In all, 706,185 pounds, worth \$436,252, were reexported.

RUBBER SCRAP.

The imports of rubber scrap in 1918 were 8,526,420 pounds, value \$645,581. The United Kingdom contributed 4,741,202 pounds, Canada 1,390,235 pounds, Newfoundland and Labrador 64,205 pounds, New Zealand 83,345 pounds, Australia 10,000 pounds, France 780,347 pounds, Italy 242,376 pounds, Cuba 585,435 pounds, and Brazil 473,196 pounds.

RECLAIMED RUBBER.

Reclaimed rubber amounting to 2,904,234 pounds, value \$502,176, was exported in turn. In 1917-18 the figures were 3,284,953 and \$567,278; this year's figures are the lowest for both amount and value, since 1914 at least.

JELUTONG (PONTIANAK).

Free jelutong to the amount of 9,932,476 pounds, value \$678,916, was imported in 1918, of which 6,807,262 pounds came from the

British East Indies, including Borneo, and 3,099,282 pounds from the Dutch East Indies. For the preceding years the amount of free and dutiable jelutong in 1917-18 was 17,475,863 pounds, valued at \$975,716; for 1916-17 only dutiable jelutong is reported, 23,376,389 pounds, worth \$1,044,022. The districts which received it were New York, San Francisco, Washington and Vermont.

THE EDITOR'S BOOK TABLE.

OPPORTUNITIES FOR HANDICAPPED MEN IN THE RUBBER INDUSTRY. By Bert J. Morris and Charles H. Pauli, Bureau of Vocational Guidance, Division of Education, Harvard University. Prepared by the Bureau of Vocational Guidance in Cooperation with Red Cross Institute for Crippled and Disabled Men, 311 Fourth Avenue, New York. Edited by Douglas C. McMurtrie. (Paper covers, 125 pages, 6 by 9 inches, illustrated.)

THIS VOLUME effectually states in untechnical language the opportunities afforded handicapped men in the rubber industry. The basic features of the industry, the source of crude rubber, and the organization of a modern rubber factory are outlined. Reference is made to these provisions for training workers and teachers in shop schools.

The book chiefly consists of a systematic account, in the form of brief descriptions, of the operations used in the preparation of crude rubber for manufacturing purposes and those involved in the main manufacturing divisions of the industry, such as rubber footwear, rubber clothing, medical goods, mechanical goods and tires. The operations are treated in detail. After each description a brief statement is made concerning the time required to learn the work, the average wages paid at the present time, the opportunities for advancement, and the suitability of the work to various handicaps.

The book is instructive and will doubtless prove helpful in assisting many crippled war veterans to self-supporting positions in the rubber industry.

THE CONDENSED CHEMICAL DICTIONARY, COMPILED AND EDITED BY THE TECHNICAL STAFF OF THE CHEMICAL ENGINEERING CATALOG. First Edition, 1919; 525 pages, 6 by 9 inches. The Chemical Catalog Co., Inc., 1 Madison Avenue, New York City.

This volume is designed for technical and non-technical inquirers who will find the book a short cut to concise information concerning the properties, derivation, grades, containers for, uses, fire hazard, and railroad shipping regulations of an extensive list of chemicals and other materials embraced in commerce and industry.

India rubber is catalogued under three heads, thus: P. 135. Caoutchouc, See Rubber. P. 267. India Rubber, See Caoutchouc. P. 406. Rubber, See Caoutchouc. Which is of course strictly accurate but not very informing.

Balata is stated incorrectly to be "rubber gum."

It is somewhat surprising that in the descriptions of the following named materials, their use in the rubber industry has been omitted; asbestos, barytes, caustic soda, fossil flour, glue, lime, lithopone, magnesium oxide, sulphur, sulphuric acid, talc, zinc oxide, besides other items described and used in the rubber industry in less important degree. In spite of these more serious omissions which will doubtless be corrected in subsequent editions the volume will prove valuable for reference in commercial and industrial circles.

TRAINING IN THE RUBBER INDUSTRY. TRAINING BULLETIN No. 20. United States Department of Labor. United States Training Service, C. T. Clayton, Director, Government Printing Office, Washington, D. C., 1919. (75 pages; 6 by 9 inches.)

This bulletin devoted to training workers in the rubber industry has been prepared for the use of instructors in factory training and for factory managers desiring authoritative information on the subject. Much valuable information is contained in the first 17 pages concerning the various features of factory training such as the purposes in view, industrial relations, operation, methods, and supervision. Following some brief

remarks on wild and plantation rubber the manufacturing operations are taken up. The operations involved in making rubber boots and various styles of shoes are explained in sequence with many illustrations, including the assembly of parts. Similarly the items of automobile tire manufacture are discussed, followed by a list of important defects to be covered by inspection.

The pamphlet closes with a bibliography on rubber drawn from books, pamphlets and periodicals in the Library of Congress, Washington, D. C., and compiled by the Research Section of the United States Training Service, April 1, 1919.

AN EXPORT ORDER AND ALLIED TOPICS. (SECOND EDITION.) Foreign Trade Department, National Association of Manufacturers, New York City. (Paper cover, octavo, 48 pages.)

This booklet is intended to show, by a series of letters, documents and forms, the successive steps involved in handling an export order, and gives in reproduction every detail of the transaction from the first inquiry of the customer to the receipt of payment and close of the transaction. Another section gives facsimiles of various forms used in connection with export shipments, consular requirements of foreign countries, and other information of interest to houses doing an export business. There is added to this some account of the workings of the National Association of Manufacturers, and the benefits accruing to members of that association.

NEW TRADE PUBLICATIONS.

THE BUFFALO FOUNDRY & MACHINE CO., BUFFALO, NEW YORK, has had the excellent idea of distributing to the rubber trade a colored peace map of Europe.

* * *

THE RAYBESTOS CO., BRIDGEPORT, CONNECTICUT, HAS STARTED publication of a handsome house organ called "The Silver Edge," to acquaint dealers with the uses of its brake-lining and the method of application, and to bring about better cooperation between the manufacturers and their customers. The 16-page magazine is printed in two colors, is copiously illustrated with half-tones and well-drawn diagrams, introduces several of the company's salesmen, and includes other matter of special interest to automobilists and repair men. Another feature is a page in the form of a poster, which can be detached and hung up in the repair shop with advantage.

* * *

"THE MASON MAIL," PUBLISHED BY THE MASON TIRE & RUBBER CO., Kent, Ohio, after five months as a four-page bi-monthly will be expanded into a monthly publication of interest to outsiders as well as to those connected with the Mason organization. The same name will be retained and the first monthly issue will appear early in November. Charles V. Gilbert will continue to edit the publication.

* * *

A PROOF THAT THE WAR IS REALLY OVER MAY BE FOUND IN THE sale by the Du Ponts of their war plants and equipment. The Du Pont Chemical Works of Wilmington, Delaware, issue a pamphlet containing lists of what they offer for sale. These include the grounds, buildings and fixtures of the big plants at Pompton Lakes, New Jersey, and at Hopewell, Virginia. The lists comprise many articles used in general manufacturing equipment from engines and elevators to bolts and nuts; also office, hospital and restaurant equipment.

* * *

THE GILLETTE RUBBER CO., EAU CLAIRE, WISCONSIN, HAS recently published two booklets, which have been distributed to all of the company. One is "The Square Deal," an introduction of the company to the employee. It tells what the company has done, is doing for the workers and what it may help them to do. It is a frank talk on the elements which will result in progress

and promotion, urging cooperation, and inculcating sound principles.

The other booklet outlines the principles and regulations of the Industrial Federation of the Gillette Rubber Co., which is described as "a democratic organization for the promotion of personal efficiency, a square deal to every member and establishment of just and fair dealing in all our relations with each other." Undoubtedly a study of these booklets must result in closer relations between the company and its employees.

* * *

THE MERCHANTS ASSOCIATION OF NEW YORK, YEAR BOOK, 1919: While much of the activity of the Association was devoted to war work, as S. C. Mead, the secretary, shows in his portion of this twenty-first annual report, the many branches of public welfare over which the various bureaus keep watch were by no means neglected. The readjustments needed by the return of peace have kept the many committees busy. The membership at the end of April was 5,881, the number of new members elected during the year being 824, the largest for any year since the Association was formed. The convenient lists of members according to their lines of business shows that 38 firms are engaged in the rubber trade. The year book is illustrated by photographs including an excellent likeness of W. Fellows Morgan, president.

* * *

DR. O. DE VRIES OF THE EXPERIMENT STATION AT BUITENZORG, Java, has published an authoritative book on the preparation and the properties of plantation rubber ("*Bereiding en Eigenschappen van Plantage-Rubber*," *Vereeniging Centraal Rubberstation, Buitenzorg*.) It is highly praised in an appreciative review by Professor P. van Romburgh in "*De Indische Mercur*."

THE OBITUARY RECORD. FOUNDED AN IMPORTANT INDUSTRY.

MAJOR WILLIAM WRIGHT HARRAL, who, with his brother, E. W. Harral, founded the Fairfield Rubber Co., at Fairfield, Connecticut, died recently at the home of his son in Mount Vernon, New York, aged 83 years. For some years he travelled in the West, selling rubber clothing and carriage cloth made by the company, and early in 1890 he took charge of the New York office and sales department on West Broadway and Franklin street, removing a year later to a larger building on Worth street. Ten years ago he retired from business, after over a quarter century of service for the industry he founded, and made his home with his son, George Harral.

Major Harral served honorably in the Civil War, taking part in the battle of Fort Sumter and several other important engagements, and later declined the offer of a very flattering position in the United States army.

FORMERLY A RUBBER MANUFACTURER.

Edward J. Slattery, who died in Boston last month at the age of 69, was at one time foreman of the cutting room of the Para Rubber Shoe Co., at South Framingham, Massachusetts, but being appointed postmaster of that town by President Cleveland he retired from the trade, and later devoted much of his time to public service.

He was for two terms a member of the State Senate and in 1898 was the Democratic candidate for Lieutenant-Governor of Massachusetts, and in more recent years served as secretary to James J. Curley, formerly mayor of Boston, during his term of office. He is survived by his widow and four sons.

A VETERAN RUBBER COMPANY BOOKKEEPER.

George W. Cummings, for many years connected with the Boston Rubber Shoe Co., died at the residence of his daughter in Brookline, Massachusetts, September 20, aged 77 years.

Mr. Cummings was of an old Boston family, the son of Daniel

Cummings. He attended the public schools and on his graduation from the English High School, entered the employ of his brother, in the wholesale flour business, later becoming partner in the firm of Charles H. Cummings & Co.

He afterwards became associated with the selling company which was formed to distribute the lines of several rubber footwear factories, and when that concern was discontinued he took charge of the bookkeeping department of the Boston Rubber Shoe Co., which department he conducted until that company was purchased by the United States Rubber Co. After a total service of nearly 30 years with these companies, he retired with a pension.

Leisure, however, became irksome after a time, and for the last few years he had been connected with a furniture concern in Boston. For some time his health had been impaired, and an operation for cancer was but a temporary relief. He is survived by his widow, a daughter, and a son, Thomas C. Cummings, who is salesman in New England for the mechanical goods department of the United States Rubber Co.

A PIONEER IN RUBBER AND OILSKIN TRADE.

Edward Macbean of the firm of Edward Macbean & Co., Glasgow, a pioneer in the rubber and oilskin trade of Scotland, died recently. He founded the business in 1876 and soon began to specialize in water-proof goods and oilskins. The first factory was at Port Dundas. Some years later, mills were erected at Johnstone, near Paisley.

The Macbean oilskins are known throughout the world, particularly the heavy oilskin coats worn by seamen.

The Breece expedition to the North Pole was fitted out with special clothing and rubber materials made by the Macbean firm. The Brattice cloth used in coal mines were an improvement of Mr. Macbean.

Mr. Macbean was in the United States in 1910 and at that time was annoyed by a newspaper account of his condemning German artificial rubber, which he discovered through THE INDIA RUBBER WORLD.

DEATH OF A SUCCESSFUL JAPANESE BUSINESS MAN.

The death is announced of Genrijo Yonei, president of the Meiji Rubber Manufacturing Co., one of the most respected business men of Tokio, at the age of 58 years. Besides controlling the Goshi Kwaisha Yonei Shoten, Mr. Yonei was managing director of the Kirin Brewery Company, and a director of the Japan Sheet Glass Company, which were developed chiefly by his exertions.

TREASURY DECISIONS.

FOUNTAIN PENS TAKED AS JEWELRY.

Internal Revenue officials have decided that "a fountain pen ornamented, mounted, or fitted with precious metals or imitations thereof, or ivory, or pearls, precious and semi-precious stones or imitations," or even a fountain pen consisting of a plain rubber holder containing a gold pen point, is subject to the jewelry tax on the total price for which such pens are sold. The Revenue Act of 1918, section 905, imposes a tax of 6 per cent on the selling price of jewelry, whether real or imitation, including pencils and pens. The penalty to dealers who fail to collect and account for the tax is a fine of \$1,000. (Treasury Decision No. 2893.)

CUSTOMS APPRAISER'S DECISIONS.

No. 38153.—Protest 817082 of American Chiclé Company, (Detroit).

CHICLÉ.—Chiclé sent from Mexico to Canada and there reduced to small pieces for convenience in transportation. Appraiser held it to be refined chiclé and assessed duty at 20 cents per pound, according to paragraph 36 of Act of 1913. Claimed that

it was crude chic, assessable at 15 cents by same paragraph. Opinion by McClelland, G. A. Chic was not refined by any process. Protest sustained. (Treasury Decisions, Volume 37, No. 15.)

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

(752.) An export company desires the addresses of manufacturers of tires in millimeter sizes.

(753.) A reader asks for the address of manufacturers of wood calendar shells.

(754.) An inquiry has been received for the address of a concern manufacturing rivetting machines for use in making outside boots for rubber tires.

(755.) A subscriber requests addresses of manufacturers of security or lug bolts for one-piece clincher rims on European cars.

(756.) A manufacturer asks where he can obtain the accelerator anhydrousformalin.

(757.) An inquiry has been received as to buyers of uncured friction scrap.

(758.) A reader asks for the addresses of manufacturers of improved machines for making square-rolled packing, imitating the hand process of folding rubbered cloth so as to make a packing square throughout.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

Addresses may be obtained from the Bureau of Foreign and Domestic Commerce, Washington D. C., or from the following district or cooperative offices. Request for each address should be on a separate sheet, and state number.

News of the American Rubber Industry.

FINANCIAL NOTES.

THE ENTIRE amount of the offering of \$36,000,000 of the United States Rubber Co.'s common stock was subscribed for without calling upon the underwriters to take any part. Subscribers for only \$2,316,550 par value availed themselves of the opportunity to pay in four instalments, the other stockholders preferred to pay \$33,683,450 par value in full on October 1.

The statement of the United States Rubber Co. and its subsidiaries for the six months ended June 30, 1919, shows surplus after charges and federal taxes of \$10,815,750, equivalent after preferred dividends to \$23.01 a share on \$36,000,000 common stock. This compares with \$10,283,025, or \$21.64 a share in the corresponding period of 1918:

	1919.	1918.
Total sales	\$99,489,372	\$108,515,725
General expenses and ordinary taxes	77,144,870	82,439,561
Operating profits	22,344,502	26,076,164
Interest charges, etc.	4,852,606	11,991,289
Federal and Canadian taxes	6,676,146	3,801,850
Net profits	10,815,750	10,283,035
First preferred dividends	2,308,484	2,468,888
Second preferred dividends	12,108	12,108
Subsidiary companies dividends	9,308	9,320
Surplus	8,285,850	7,792,709
Previous surplus	41,848,051	31,891,207
Total surplus	\$6,133,901	\$39,683,916
Items applying to prior period	50,133,901	40,640
Profit and loss surplus	50,133,901	39,643,256

The Boston Woven Hose & Rubber Co.'s balance sheet as of September 1, 1919, shows a surplus of \$2,035,183, an increase of \$352,986 over last year. After the signing of the armistice the Government cancelled many orders. This left a large inventory on the company's hands, which has now been reduced \$362,851 to \$2,675,225. It has increased its working capital during the year by \$514,099, the total now being \$3,439,598, and is free from debt. During the year the company began to manufacture automobile tops. This business has proved very profitable and will be largely increased in volume.

The company's balance sheet, compared with that for 1918, is as follows:

ASSETS.	September 1.	
	1919.	1918.
Patents	\$1	\$1
Office furniture	1	1
Land and buildings	1,502,130	1,558,982
Machinery and tools	943,493	987,414
Cash	581,118	420,770
Accounts receivable	1,228,073	1,351,472
Liberty bonds	410,376	250,649
Inventory	2,675,255	3,038,106
Total	\$7,450,409	\$7,607,395
LIABILITIES.		
Preferred stock	\$750,000	\$750,000
Common stock	3,100,000	3,039,700
Bills payable	790,000	1,552,000
Liberty bonds (loans)	325,000	
Accounts payable	253,257	309,044
Taxes	65,101	255,082
Accrued wages	21,866	19,372
Surplus	2,035,183	1,682,197
Total	\$7,340,409	\$7,607,395

The Goodyear Tire & Rubber Co., Akron, Ohio, recently announced that the \$15,000,000 worth of second preferred eight per cent stock which was issued during the war was to be called in at 105 on November 1. It offered to each employee the opportunity to subscribe for any number of shares up to twenty of its preferred non-assessable seven per cent cumulative stock, for which payment will be accepted at the rate of \$4 monthly per share, to be deducted from salaries, payments to be completed within two years, subject to an interest charge on deferred payments. Quarterly dividends of one and three-quarters per cent will be paid on the full par value of stock subscribed for. Special

inducement will be offered to subscribers to hold stock. Subscriptions started October 29 and closed November 1, the total number of subscribers in the factory and office being 16,016 and their subscriptions amounting to \$6,746,800. This did not include the plants in Canada, Arizona, or California.

It has become known that the Mason Tire & Rubber Co., Kent, Ohio, has a plan under way for increasing its capital stock to \$7,500,000. No definite announcement has been made, but it is understood that sales for the time being are to be restricted to present stockholders.

The Firestone Tire & Rubber Co., Akron, Ohio, is issuing \$10,000,000 of seven per cent preferred stock for the purpose of enlarging its plant. The immediate purpose of the issue is to provide the company with additional working capital, to construct a new mechanical building and a new steel rim plant, and to furnish additional equipment for plant No. 2 to increase its output, which consists of 3½-inch tires and tubes exclusively. The present output is 22,000 tires and 25,000 tubes a day; the additional equipment will raise this to 36,000 tires and 40,000 tubes daily. In the last complete eight years the amount of net sales and net earnings after preferred stock dividends had been paid were as follows:

	Net Sales.	Net Earnings.
1918	\$75,801,507	\$4,664,615
1917	61,587,219	4,615,298
*1916	44,135,326	5,837,021
1915	25,319,476	4,447,271
1914	19,250,110	3,157,719
1913	15,720,907	1,558,059
1912	11,683,200	1,126,911
1911	7,462,581	566,752

* Fifteen months—end of fiscal year changed from July 31 to October 31.

For the nine months, November 1, 1918, to July 31, 1919, the net sales amounted to \$59,145,396, and for the month of August the net sales were over \$10,000,000, the largest amount in the company's history, exceeding greatly the total year's sales of nine years ago.

The Goodyear Tire & Rubber Company of California has issued \$2,000,000 more of seven per cent preferred stock in addition to the \$6,000,000 put on the market in July, making eight million out of the ten million authorized.

The company has acquired 440 acres of ground at Los Angeles adjacent to the 600 acres, forming Ascot Park, that were first acquired. On this will be built also the plant of another subsidiary of the Akron parent company, the Pacific Cotton Mills Co., that will manufacture the cotton fabrics which enter into the construction of tires and other rubber products from the cotton grown in Arizona and Southern California. The Pacific Cotton Mills Co. has just issued \$2,000,000 of seven per cent preferred stock, out of \$3,000,000 authorized. The plant is expected to run 33,000 spindles.

Shares of The Fisk Rubber Co. are active, as the statement for the first eight months of 1919 is expected to be very favorable. Sales are amounting to more than \$5,000,000 a month so that last year's total of \$36,000,000 will be far surpassed. When the additions to its manufacturing equipment at Chicopee Falls are completed the company will be able to turn out 15,000 tires a day. For the last five years, surplus profits have been turned back into the business, but the directors now believe that a dividend on the common stock can be paid. This will be done probably before the new year.

The balance December 31, 1918, of \$4,425,923 had become \$8,009,143 by September 30, 1919, and the profits from January 1 through September 30, 1919, were \$4,199,399.

The Hodgman Rubber Co., whose factories are at Tuckahoe, New York, is issuing \$1,000,000 of 8 per cent convertible cumulative preferred stock. The concern dates from 1838 and is the oldest in the manufacture of rubber goods in the United States.

The McGraw Tire & Rubber Co. has applied to be listed on the Cleveland Stock Exchange. Its present capitalization is \$840,000 of 7 per cent cumulative preferred stock and \$1,950,050 of common stock. This will be changed into an issue of 100,000 shares of common stock of no par value and \$2,500,000 of preferred stock, with \$5,000,000 authorized. This will be used to withdraw the old preferred stock, the remainder for working capital. Each holder of common stock will receive two new shares for each share of \$50 par value.

The McGraw Tire & Rubber Co. has been in existence ten years, manufacturing cord and fabric automobile tires, truck tires and inner tubes. The net sales, which were \$746,000 in 1912, will be over \$7,000,000 in 1919. It has paid 12 per cent dividends on its common stock for the last three years.

The Phoenix Rubber Co., Akron, Ohio, that was organized in March, 1916, for the purpose of reclaiming rubber, is issuing \$200,000 of 7 per cent preferred stock of a par value of \$100 a share and \$100,000 of common stock at \$25 a share. Common stock will be sold only to purchasers of preferred stock at the rate of two shares of common stock for one of preferred.

The proceeds of the new issue will go into new buildings and equipment. One large three-story building planned will turn out 300 tires, 900 tubes, 20,000 pairs of soles, 20,000 pairs of heels, and 20,000 of other rubber products a day.

The Goodyear Tire & Rubber Co., Akron, Ohio, has sold \$40,000,000 of a total authorized issue of \$100,000,000 seven per cent cumulative preferred stock to a group of Cleveland, New York and Chicago bankers. The proceeds will be used to retire its two outstanding issues of preferred stock. The new stock will be offered for subscription at \$100 a share and accrued dividends and holders of present Goodyear stock, first and second preferred and common will have the preference.

REFINANCING PLANS OF STANDARD TIRE CO.

The Standard Tire Co., Willoughby, Ohio, is paying a 50 per cent stock dividend out of surplus and selling \$350,000 additional stock to its present stockholders; one-half of this is common and the other half preferred. It is also increasing the common from \$350,000 to \$1,000,000 and the preferred from \$150,000 to \$500,000.

About the first of the year R. J. Firestone, Tom A. Palmer, and E. A. Tinsman associated themselves together, interested Akron capital, and purchased the plant of the old Standard Tire & Rubber Manufacturing Co. at Willoughby, Ohio. The refinancing which has taken place is due to increased business requiring additional funds to handle the growing demand for the company's tires. In the last three months, the concern has more than doubled its output and with the additional capital will now be able to increase it materially.

DIVIDENDS.

The Advance Rubber Co., Brooklyn, New York, recently declared its semi-annual dividend of four per cent, payable September 10 on stock of record June 30, 1919.

The American Chiclé Co., New York City, has declared a dividend of one per cent, payable November 1 on stock of record October 21, 1919.

The American Zinc, Lead & Smelting Co., St. Louis, Missouri, and New York City, has declared its quarterly dividend of \$1.50 per share, payable November 1 on preferred stock of record October 24, 1919.

The Ames-Holden-McCready Co., Montreal, Quebec, has declared its quarterly dividend of one and three-quarters per cent,

payable October 1 on preferred stock of record September 19, 1919.

The Brunswick-Balke-Collender Co., Chicago, Illinois, has declared its quarterly dividend of one and three-quarters per cent, payable October 1 on preferred stock of record September 20, 1919.

The Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, has declared its quarterly dividend of one and three-quarters per cent, payable September 30 on preferred stock of record September 24, 1919.

E. I. du Pont de Nemours & Co., Wilmington, Delaware, have declared a dividend of one and one-half per cent, payable October 25 on its debenture stock of record October 10, 1919.

The General Electric Co., Schenectady, New York, has declared its quarterly dividend of two per cent, payable October 15 on stock of record September 15, 1919.

The General Tire & Rubber Co., Akron, Ohio, has declared its quarterly dividend of one and three-quarters per cent, payable October 1 on preferred stock of record September 20, 1919.

The Goodyear Tire & Rubber Co., Akron, Ohio, has declared its quarterly dividend of one and three-quarters per cent, payable October 1 on first preferred stock of record September 15, 1919.

The Hawkeye Tire & Rubber Co., Des Moines, Iowa, has declared a dividend of eight per cent, payable October 15 on stock of record October 1, 1919.

The Hood Rubber Co., Watertown, Massachusetts, has declared its forty-seventh consecutive quarterly dividend of one and three-quarters per cent, payable November 1 on preferred stock of record October 21, 1919.

The Kelly-Springfield Tire Co., New York City, has declared the following quarterly dividends: cash, \$1 per share, and stock dividend of three per cent, payable November 1 on common stock of record October 18; an initial dividend of \$2 per share, payable November 15 on eight per cent preferred stock of record November 1, 1919.

The Keystone Tire & Rubber Co., New York City, has declared its quarterly dividend of three per cent, payable October 1 on stock of record September 19, 1919.

The National Aniline & Chemical Co., New York City, has declared its quarterly dividend of one and three-quarters per cent, payable October 1 on preferred stock of record September 15, 1919.

The New Jersey Zinc Co., New York City, has declared a quarterly dividend of four per cent, payable November 10 on stock of record October 31, 1919.

The Owen Tire & Rubber Co., Cleveland, Ohio, has started payment of accrued dividends on preferred stock, checks being sent to stockholders who have paid for stock bought during the last quarter of 1917 and the first quarter of 1918. In December the company expects to pay accrued dividends on stock bought and paid for during the second and third quarters of 1918, and will continue this policy until all accrued dividends on preferred stock shall have been paid.

The Portage Rubber Co., Akron and Barberton, Ohio, has declared its regular quarterly dividend of three per cent, payable November 15 on common stock of record November 5, 1919.

The Tyer Rubber Co., Andover, Massachusetts, declared its regular quarterly dividend of \$1.50 per share, payable October 15, 1919, on common stock.

The United States Rubber Co., New York City, has declared its quarterly dividend of two per cent on its first preferred stock and a dividend of two per cent on common stock, both payable October 31 on stock of record October 15, 1919. The common stock dividend is the first since the interruption by the war and is accompanied by the declaration that it is the intention of the company now to place its common stock on a regular eight per cent basis.

The Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, declared its quarterly dividends of two per cent, payable October 15 and 31st, respectively, on preferred and common stock of record October 3, 1919.

RUBBER COMPANY SHARE QUOTATIONS.

The following rubber stock quotations on October 18, 1919, are furnished by John Burnham & Co., 41 South La Salle street, Chicago, Illinois:

	Bid.	Asked.
Ajax Rubber Co., Inc.	95 1/2	96 1/2
Brunswick-Ball & Collender Co., preferred	103	104
Du Pont de Nemours & Co., E. I., common	91	92
Du Pont de Nemours & Co., E. I., debentures	91	93
Firestone Tire & Rubber Co., common	178	180
Firestone Tire & Rubber Co., preferred	98	100
Fisk Rubber Co., The, common	51	52
Fisk Rubber Co., The, first preferred	98	101
Fisk Rubber Co., The, 2nd preferred	190	200
Goodrich, B. F., Rubber Co., The, common	82 1/2	83 1/2
Goodrich, B. F., Rubber Co., The, preferred	103 1/2	104 1/2
Goodyear Tire & Rubber Co., The, common	395	402
Goodyear Tire & Rubber Co., The, first preferred	109	111
Kelly-Springfield Tire Co., common	153	154
Kelly-Springfield Tire Co., first preferred	95	97
Lee Tire & Rubber Co.	29 1/2	30 1/2
Marathon Tire & Rubber Co.	55	57
Miller Rubber Co., The, common	188	195
Miller Rubber Co., The, preferred	103	106
Rubber Products Co., The, common	135	140
Portage Rubber Co., The, common	136	141
Swinchart Tire & Rubber Co.	87	90
United States Rubber Co., common	122 1/2	123 1/2
United States Rubber Co., preferred	116 1/2	117 1/2

RUBBER INDUSTRIES ATHLETIC LEAGUE BASKET-BALL TOURNAMENT.

Since the close of the baseball season the Rubber Industries Athletic League has turned its attention to basket ball to which it will devote Friday evenings throughout the winter.

It is the intention of the League officials to put on the floor a team which will compare favorably with any team that ever passed a ball. Only one team will be formed from the entire league membership which will represent the League as a body. The line-up will include such well-known stars as Ruckert and Studebaker of Firestone, Reich and Dreyfus of United States and Belsky of Ajax.

The court at Savage's Gymnasium on 60th street near Broadway, in the heart of the rubber district of New York, has been secured for each Friday evening during the season, beginning November 21.

WINNERS OF THE WATCH FOBS.

The baseball players, whose individual records during the season won for them the watch fobs presented by A. G. Spalding & Brother were: A. J. Savarese, Ajax Tire & Rubber Co., Inc.; L. A. Mayborn, Kelly-Springfield Tire Co.; W. Ruckert and C. D. Studebaker, Firestone Tire & Rubber Co.; L. Abbott and H. Knox, The Goodyear Tire & Rubber Co.; E. Head, E. Reich, J. Walsh, and J. Savage, United States Rubber Co.; and J. Gray, P. Teed, and G. Scott, The B. F. Goodrich Co.

GAS MASKS FOR INDUSTRIAL USE.

The gas mask is rapidly finding its proper place in the industries. Experience has shown that it has a wide application in protecting workmen from the noxious gases and fumes given off in many chemical operations. In rubber factories gas masks could be used around volatile solvents, such as carbon disulphide, carbon tetrachloride, sulphur chloride and certain organic accelerators. In allied chemical plants they give good protection in pyrite smelting and roasting operations wherever sulphur dioxide or oxides of nitrogen are encountered. The war gave great impetus to the development of better gas masks, and now the Bureau of Mines has established a gas mask department at the Pittsburgh Experiment Station, where masks of the army type will be developed for industrial use.

AMERICAN ZINC, LEAD & SMELTING CO.'S NEW PLANT.

The American Zinc, Lead & Smelting Co., of St. Louis, Missouri, having found its zinc oxide plant at Hillsboro, Illinois, too small to fill the growing demands for its output, has decided to build a new plant at Columbus, Ohio, on a 40-acre tract of land bordering on the Akron division of the Pennsylvania railroad. Construction will be pushed, and it is hoped to have the works ready for operation by January 1, 1920.

At this plant will be manufactured the Azo ZZZ brand of zinc oxide, and zinc ores free from lead for making this grade will be shipped from the company's mines at Mascot, Tennessee. The company has other mines at Joplin, Missouri, and Platteville, Wisconsin, and smelters at East St. Louis and Hillsboro, Illinois; Caneby, Kansas; and Granby, Missouri.

WILLIAM D. ANDERSON HEADS BIBB MANUFACTURING CO.

At the recent annual meeting of the Bibb Manufacturing Co., maker of tire fabrics, Macon, Georgia, William D. Anderson was elected president; E. T. Comer, chairman of the board of trustees; J. H. Porter, vice-president; J. I. Comer, second vice-president; Charles H. Williams, secretary and treasurer, and A. A. Drake, assistant treasurer. John A. Porter continues as general superintendent of the four mills at Macon, two at Porterdale, one at Columbus and another at Reynolds.

Extensive improvements are being made at Columbus and in one of the Macon mills, and an auditorium and other community features are to be built in each of the mill villages in Macon. Bonuses have been paid to faithful employees according to period of service from three to ten years. The usual dividends were declared at the annual meeting.

NEW EXPRESS PACKING RULES.

Effective December 10 the use of paper wrapping for express packages weighing over 25 pounds will not be permitted. Ordinary paper boxes, wrapped or unwrapped, are also forbidden. For shipments over 25 pounds, wooden containers, or containers of fiberboard, pulpboard or corrugated strawboard material are required. The cartons must be made of materials of specified "test strengths," similar to those required for the freight service, and the containers must bear the stamp of the manufacturers certifying that the material used is of strength required for the weight of the shipment carried in it, as called for in the rules. Shippers are requested to study Supplement No. 5 to Express Classification No. 26, in which these rules are embodied, and copies of which may be secured at any express office.

STANDARDIZATION OF GOLF BALLS.

At its first meeting since 1914 the British Golf Rules Committee resolved to submit to the association a new rule standardizing golf balls. Changes in rules by the English authorities are usually followed in America, and golf ball standardization will hardly be an exception. Such an innovation, it is believed, would pave the way for a firmer foundation for international play. With plans in the making in both England and the United States, and entries being booked for the 1920 championships next season may witness all titular play with a standard golf ball.

RUBBER STAMPS AID ARCHITECTS AND DRAFTSMEN.

Rubber stamps are being made that represent interior fittings, such as bath tubs, kitchen sinks with the faucets and so on, which should be convenient for architects and draftsmen who have to draw the same thing over and over again in different parts of a plan. The stamp prints the outline drawn to standard scale, and the impression can be touched up as required. Though only used for plumbing fixtures at present, the stamp offers possibilities for much wider application to parts of drawings that must be repeated frequently.—("Popular Mechanics.")

PERSONAL MENTION.

Duffy and Sears, who have recently opened offices at 133 Front street, New York, as crude rubber brokers, are progressive young men who have grown up in the crude rubber business.

L. A. Duffy began his rubber career with the New York Commercial Co. in 1902 and was transferred from New York in 1907 to Manáos where he remained two years with A. H. Alden & Co., the parent concern of the New York Commercial Co.

From 1913 to 1916 he was connected with W. R. Grace & Co., New York City, resigning to go with the Hagemeyer Trading Co. as assistant manager of the crude rubber department. Here he remained for two years and after a few months with J. Frank Dunbar, New York City, resigned to form the partnership with Mr. Sears.

S. H. Sears also served his apprenticeship with the New York Commercial Co., from 1903 to 1911, when he went to the Firestone Tire & Rubber Co., Akron, Ohio, as a crude rubber expert, and in 1916 was sent to the Far East, visiting the Malay Peninsula, Java, and Sumatra, in the interest of the Firestone company. Mr. Sears was assistant manager of the Firestone crude rubber department when he resigned to engage in business with Mr. Duffy.

The following appointments have been made by The B. F. Goodrich Co., Akron, Ohio: Edward H. Fitch, for three years manager of Philadelphia branch, promoted to the position of manager of manufacturers' sales for the entire Goodrich line, with headquarters at Akron; C. H. Smith, for twenty years in charge of Diamond sales in Chicago and the mid-west district, promoted to managership of Chicago branch, in charge of both Goodrich and Diamond tire sales and the entire Goodrich line of products; N. E. Oliver, for some years in charge of Diamond sales in the New York district, appointed manager of the New York branch, supervising sale of all Goodrich products and retaining supervision of Diamond sales; E. P. Rowen, for fourteen years manager of Chicago branch, appointed manager of Diamond tire sales for the United States, with headquarters at Akron; and H. J. Morehead, for four years manager of the New York branch,

promoted to manager of Philadelphia branch, in charge of sale of both Goodrich and Diamond tires and the entire Goodrich line of products.

F. K. Stephenson has been appointed export manager of The Portage Rubber Co., Akron and Barberton, Ohio, with headquarters in New York City. He was formerly export manager for the Republic Rubber Co. in the same city.

B. C. Swinehart has resigned as general manager of the United & Globe Rubber Co., Trenton, New Jersey, and will return to Akron, Ohio, where for six years he was with the Swinehart Tire & Rubber Co.

L. G. Chase, formerly efficiency engineer of the Rosemary Manufacturing Co., Rosemary, North Carolina, has been appointed mechanical engineer of the Yarnall-Waring Co., Chestnut Hill, Philadelphia, Pennsylvania.

E. V. Peters, general sales manager of The New Jersey Zinc Co., New York City, will spend a month in the West, accompanied by R. M. Neumann, of the Chicago office, manager of western sales, and will visit among other cities, Denver, San Francisco, Los Angeles, Portland (Oregon), and Seattle.

C. T. Anderson has been appointed manager for The Portage Rubber Co., Akron and Barberton, Ohio, succeeding B. Anderson-Smith, resigned, at Philadelphia, Pennsylvania.

S. B. Woodbridge has been made director of sales of the lithopone, dry colors and pigment division of E. I. du Pont de Nemours & Co., Wilmington, Delaware. He had been identified with Harrison Bros. & Co., Philadelphia, for ten years previous to the taking over of that concern by the Du Pont company, and was also sales manager for the Beckton Chemical Co., manufacturer of lithopone and allied with the Harrison company at the time both were taken over by the Du Pont company.

Leslie E. Freeman has been appointed resident representative of the American Chamber of Commerce for Brazil in the United States, with offices at 37 Liberty street, New York City.

Curtis L. Moody, for the past four years with The Fisk Rubber Co., Chicopee Falls, Massachusetts, and manager of the schedule and mold engineering department since its establishment two and one-half years ago, has resigned to accept an executive position with The Perfection Tire & Rubber Co., Fort Madison, Iowa.

E. T. Peterson has been appointed manager of the Buffalo, New York, branch of the Pennsylvania Rubber Co., Jeannette, Pennsylvania.

Captain Harry B. Tuttle has been appointed special representative for bicycle and motorcycle tires and tennis balls manufactured by the Pennsylvania Rubber Co., with headquarters at Jeannette, Pennsylvania.

L. A. DUFFY.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

AN INCREASE of \$20,960,780 in all kinds of property values in Providence is shown by the official assessment of the Board of Tax Assessors for the year 1919. In the list of more than 1,000 individuals, firms and corporations that are assessed upon a valuation of \$50,000 or more are the following that are directly, or indirectly, associated with the rubber industry: American Multiple Fabric Co., \$94,380; Augustus O. Bourn, \$84,640; Bourn Rubber Co., \$272,580; Walter S. Ballou, \$87,640; Joseph Banigan estate, \$1,045,580; Samuel P. Colt, \$219,060; Mary E. Davol, widow of Joseph Davol, \$834,500; Davol Rubber Co., \$500,000; Glendale Elastic Fabric Co., \$117,300; International Braid Co., \$1,079,320; William B. McElroy et ux, \$118,100; Mechanical Fabric Co., \$202,500; Revere Rubber Co., \$1,346,200; Rhode Island Hospital Trust Co., trustee under the will of Joseph Davol, \$465,100; James E. Sullivan (trustee), \$288,780; United States Rubber Co., \$1,651,960.

The Revere Rubber Co., Providence, has purchased additional land at Valley and Eagle streets, aggregating nearly 35,000 square feet for the purpose of enlarging its plant. This with the land already owned gives the company a tract containing more than 1,000,000 square feet.

The property of the American Locomotive Works, containing about 450,000 square feet, was acquired more than a year ago and the rebuilt and new structure were recently put in operation for the manufacture of light rubber goods, especially druggists' sundries.

Since taking over the old Banigan Rubber Co.'s plant several years ago the Revere Rubber Co. has steadily increased its plant. The original factory buildings are now used for the manufacture of solid rubber tires for motor trucks, the production of pneumatic tires and tubes having been transferred to other plants of the United States Rubber Co., which controls the Revere Rubber Co.

Work was commenced during the past month on new buildings that will add nearly 60,000 square feet of floor space and cost approximately \$200,000. One of the new buildings will be used for laboratory purposes and the other for manufacturing. Both buildings will be of concrete and steel, three stories high. The laboratory building will be 150 by 50 feet and the manufacturing building, 120 by 100 feet.

Another forward step in the movement for the welfare of its employees has been taken by the National India Rubber Co., at Bristol, by the installation of an excellent dental equipment. The outfit consists of a sterilizer and stand, an air compressor, unit equipment and dental chair, an aseptic table stand, dental cabinet, a Bosworth light and a gas oxygen outfit. Employees may have dental work performed at only a nominal fee to help cover the cost of material used. Dr. M. J. O'Brien is in charge.

A legal department has also been established which is to be conducted for the sole interests of the employees of the corporation. Judge Frank H. Hammill, attorney-at-law, has been engaged to maintain an office at the company's plant where he will spend a portion of every working day. Legal advice concerning personal and property rights will be provided without charge.

The Glendale Elastic Fabric Co. has commenced extensive alterations and repairs at its four-story building in Providence.

The Davol Rubber Co. has commenced the erection of a one-story pumping house at its plant in Providence.

P. Raymond Wesley has been made general manager of the Davol Rubber Co., Providence, succeeding Edwin M. Caldwell who resigned October 1. Mr. Wesley has been with that company in responsible positions for about 25 years.

Day and night shifts are being employed at the International Rubber Co.'s plant in West Barrington, owned by the O'Bannon Corporation, owing to the pressure in the market for carriage cloth, one of the products of this concern.

A twelve-ton boulder has been placed on the lawn in front of the office of the Alice Mill of the Woonsocket Rubber Co., facing Fairmount street, Woonsocket, upon which has been mounted a bronze honor roll tablet of the employees of that corporation who went from the Alice Mill into various branches of the country's service during the World War. It bears the names of 90 employees. The memorial was dedicated with appropriate exercises on Saturday, October 11, in the presence of the entire force.

The Woonsocket Rubber Co. has received recognition from the United States Government for taking back into its employ every former worker who went into military or naval service, who applied for his place upon returning. Of the employees who went into service, more than two-thirds are reported as being back at their old jobs or better ones.

WAR MEMORIAL ERECTED AT THE ALICE MILL OF THE WOONSOCKET RUBBER CO.

WESLEY APPOINTED GENERAL MANAGER.

THE APPOINTMENT of P. R. Wesley to the position of general manager of the Davol Rubber Co., Providence, Rhode Island, was a natural and fully deserved promotion of one who had risen step by step during a service of more than a score of years with that corporation.

Mr. Wesley was born in Columbia, Connecticut, September 3, 1871, and was educated in Hartford, that state, where he was graduated with the degree of B.S. from Trinity College in 1894. For three years, while in college, he served on the "Hartford Telegram," and after graduation became buyer for a department store in Providence, Rhode Island. He entered the employ of Joseph Davol, founder of the Davol Rubber Co., in a private capacity in 1898, and then served successively in the pricing and purchasing departments and as assistant to general manager C. J. Davol, now president of the company. Mr. Wesley was made manager of sales four years ago, and on October 1, this year, he became general manager.

P. R. WESLEY.

THE RUBBER TRADE IN NEW JERSEY.

By Our Regular Correspondent.

TRENTON NOTES.

DISTRICT MANAGERS representing the Empire Tire & Rubber Co. in all sections of the country recently held a three-day conference at the plant at Trenton. Twenty-two representatives attended and plans were arranged for launching the sales campaign next year. Officials announced at the session that bright prospects are held for the coming year, when all records in the automobile tire industry are expected to be shattered.

The Empire Tire & Rubber Corp., Trenton, has engaged a number of women to act as inspectors of rubber goods at the plant.

The Zee-Zee Rubber Co., Yardville, New Jersey, has inaugurated a plan to establish branches in the various cities of New Jersey. The company requests that a merchant in each town deposit between \$250 and \$5,000, according to size of territory, with the rubber corporation. The deposit will be held for one year at six per cent interest, the principal being returned to the owner when business connections are severed.

Nicholas Loukopulos, a former Trenton merchant, sailed on October 20 for Patras, Greece, where he will introduce the products of the Acme Rubber Manufacturing Co., and establish agencies there for the sale of tires. The Acme company believes that with automobiling increasingly popular in Greece a big demand for American tires will ensue and the Trenton concern is the first in that field.

The Thermoid Rubber Co., Trenton, has appointed John T. Spicer general sales manager, with offices at the Trenton factory. Mr. Spicer has been advertising manager of the company for some time.

The Atlas Tire & Rubber Co., Trenton, has changed its name to the Trent Rubber Co.

MISCELLANEOUS NEW JERSEY NOTES.

Dr. Frederic Dannert, a leading authority on industrial chemistry, delivered on October 17 the first of a series of thirty lectures on corporation chemistry. This and other lectures in the same group deal with advance industrial surveys, from the point of view of the industrial chemist, of original sources of raw materials and purification plants in the primary markets, including mines, forests, plantations, etc. Subsequent lectures will give directions in the line of efficiency in executive and advisory departments, of laboratory management for business purposes, and of the economic department. The lectures will be given at the College of Technology, 367 High street, Newark, New Jersey, on Friday evenings.

The Victory Tire & Rubber Co. has changed its name to Rydon Tire & Rubber Corp. and discontinued its New York office at 5 Columbus Circle. It is temporarily located at 610 Eighth avenue, Asbury Park, New Jersey, while its new factory is being built.

The Driver-Harris Co., Harrison, New Jersey, is building a three-story reinforced concrete addition to its factory, 50 by 100 feet, to cost \$50,000.

The Howe Rubber Co., of New Brunswick, New Jersey, has opened a new cafeteria on the roof of its plant for the comfort and convenience of employees. The opening was a chicken dinner for the 400 employees. The meals are being served at cost. The idea was inaugurated by W. H. Albert, comptroller of the company.

Charles Andrew Perkins, formerly office manager of the Endurance Tire & Rubber Co., New Brunswick, New Jersey, died recently at his home in New Brunswick, after a long illness, aged 32. He was a member of the New Brunswick Lodge of Elks and sang in the Christ Church choir at that place.

The Braender Tire & Rubber Co., Rutherford, New Jersey, is putting up a four-story addition to its factory, which it is expected will double its present production capacity.

THE RUBBER TRADE IN MASSACHUSETTS.

By Our Regular Correspondent.

THE OLD BAILEY RUBBER STORE, for over 30 years on Boylston street, Boston, is holding a sale preparatory to removing to an even more central location in the shopping district. The new store will be at 11 and 13 Avon street, directly adjoining the Jordan, Marsh Co. annex. The business will occupy the entire four-story and basement building, which will be refitted and equipped for the purpose.

The C. J. Bailey Co., which succeeded to the business of the late Mr. Bailey, will continue to carry a full line of all kinds of rubber goods, but will add thereto a complete line of women's ready-to-wear garments, gowns, shirtwaists, etc. M. S. Lawrence, the treasurer of the company, who will have general management of all departments, was for more than 30 years associated with the late C. J. Bailey, and he will be assisted by H. E. Bailey, son of the founder of the house, and for several years an assistant to his father. While these new lines are to be added, the same attention will be given to the rubber trade, in which the house has become famous.

The embargo on transportation has no terrors for the Ajax Rubber Co., of Trenton, New Jersey, at least as far as the Boston branch of the company is concerned. Motor trucks are bringing tires to this city, the run from the factory being made in 15 or 20 hours. Big trucks holding about 700 tires are used, and on the return trips they are loaded with fabric. Thus time and expense are saved, with a certainty of satisfactory service.

C. E. Aldridge has been appointed manager of the Boston branch of The Portage Rubber Co., Akron and Barberton, Ohio, succeeding G. D. Niles, resigned.

Richards & Co., Inc., Boston, one of the oldest houses in the metal trade, established over a century ago, has recently entered the crude rubber business, making a specialty of Ceylon rubber. This new department is in charge of John Heard, who has been associated with the house for the last decade.

Thomas C. Cummings, for many years connected with the United States Rubber Co., and its subsidiary companies, has associated himself with E. M. Hamlin & Co., bankers, Boston, where he is devoting much of his time to rubber industrial investments. Mr. Cummings was first identified with the National India Rubber Co., Bristol, Rhode Island, later with the Mechanical Rubber Co., Cleveland, Ohio, and more recently until October was located with the mechanical department of the Boston office of the United States Rubber Co.

H. C. Krimmel, who has been manager of truck tire sales in New England for The B. F. Goodrich Rubber Co., Akron, Ohio, has been transferred to the Chicago branch of that concern. He is succeeded by Robert C. Freeman, who has been with the company several years, first as truck tire salesman in some counties of this state, then given exclusive Boston territory, and later made special sales representative to large consumers of truck tires.

The Boston Rubber Shoe Co. has opened a fine recreation room on the first floor of one of its big buildings at its Plant No. 2 in Melrose. The dedication exercises were held October 7, when various officials of the company were present, and addresses were delivered by Superintendent Philip C. Benjamin and by Mayor Adams of Melrose, who highly commended the efforts of the management in its social service to its employees. An interesting musical program was given under the auspices of young women

employed in the factory, and a dance followed the formal exercises. The new recreation room is large, well-lighted, has an excellent dancing floor, a new piano and will accommodate about 400 persons. A matron and teacher of dancing and of physical exercises will be present when the hall is opened for the brief recess period in the forenoon, in some departments, and during the noon hour.

The Associated Industries of Massachusetts held a two-day annual meeting in Boston October 22 and 23, which was presided over by its president, Frederic C. Hood, treasurer and general manager of the Hood Rubber Co., of Watertown. Mr. Hood made two addresses during the conference, one at the opening, and another on the second day, this latter being on the subject of "Employment Relations." The address was an able one and received the hearty approval of the entire assemblage. Mr. Hood retired from the presidency at this meeting and was succeeded by Charles A. Andrews, who is prominently connected with a leading fisheries company. William H. Gleason, formerly of the Revere Rubber Co., Chelsea, Massachusetts, was reelected treasurer.

Chester J. Pike, who for several years was New England selling agent for the United States Rubber Co., but who for the last decade has occupied a prominent position in the advertising world as New England manager of Hoyt's Service, Inc., was chairman of the entertainment committee at the convention of the American Association of Advertising Agencies, which was held in Boston the middle of October.

The Boston Woven Hose & Rubber Co., Cambridge, finds the growth of its leatherette department increasing to such an extent that it is erecting a special building on a lot adjoining its present plant on Portland street, Cambridge. The plan of the building is to have each operation of the manufacture isolated from all others and each room is separated by a twelve-inch fire wall. Four concrete storage bins are provided for the storage of chemicals.

An interesting feature is the arrangement for carrying off vapors peculiar to the manufacture of leatherette. These vapors, heavier than air, are carried away through the floor. The company is developing an extensive foreign trade for its leatherette.

The Converse Rubber Shoe Co., Malden, will soon build a five-story reinforced concrete storehouse, 75 by 52 feet, at an estimated cost of \$75,000.

The United Shoe Machinery Corporation is building a three-story reinforced concrete building at its Beverly, Massachusetts, plant. It will be 400 feet long and 120 feet wide, and will be used mainly as a storage warehouse.

The Tyer Rubber Co., Andover, Massachusetts, has greatly enlarged the scope of its machine shop, where a large amount of new equipment has been installed, thus better enabling the company to handle its repairs, and also to manufacture its own mold equipment for tires and sundries. The company reports a marked increase in its export trade in druggists' sundries during the present year. A dinner gathering of the management and employees was held at the Phillips Inn, the evening of October 27, when plans for closer cooperation and mutual service were discussed.

The Fisk Rubber Co., Chicopee Falls, Massachusetts, has organized an educational department, to which all boy employees are eligible. It is under the supervision of Miss Louise Scott. English, spelling and bookkeeping are the subjects now taught, and shorthand and typewriting may be added later. The class is held three nights a week, the sessions lasting from 5.30 to 6.45 o'clock.

The Firestone Tire & Rubber Co., Akron, Ohio, has appointed G. I. Engle, formerly manager of its branch at Springfield, Massa-

chusetts, to be special manufacturers' representative for the New England district.

EASTERN NOTES.

The Norwalk Tire and Rubber Co., Inc., Norwalk, Connecticut, is building a five-story addition to its factory, 85 by 160 feet. The foundations are now being put in and it is expected that the building will be completed by March 1, 1920.

The Goodyear Cotton Mills, Inc., Killingly, Connecticut, recently offered its employees an opportunity to subscribe to its seven per cent cumulative stock. About 200 responded, of whom 13 took stock to the amount of about \$1,000 each and 36 others \$500 each, the average subscription being \$270, and the total, \$54,000. This stock carries a bonus of three per cent to all who subscribe and remain employees of the company.

The Mechanical Tire Co., Inc., 49 North Third avenue, Mount Vernon, New York, has increased its capital to \$100,000 but no stock has as yet been issued. Aron Rubin is secretary.

The Amalgamated Tire Stores Corp. of Delaware has been organized to acquire the assets of the Newman Tire & Rubber Co., Inc., New York City, now operating eleven stores in New York and Pennsylvania and one in Baltimore, Maryland. No indebtedness will be incurred and the new corporation will open thirty to forty more stores in other cities. The officers are: Stanley Newman, president; Arthur Newman, vice-president; and William Friday, secretary and treasurer; directors—J. Robinson-Doff, Edward R. Hewitt, George M. L. LaBranche, Jay Rathbun, Jason Rogers, and Frederick A. Travis, in addition to the officers named above. The audit and inventory were made by A. H. Wahn & Co., 120 Broadway, New York City.

The Crompton & Knowles Loom Works, Worcester, Massachusetts, has disposed of its branch plant at 17th and Glenwood avenue, Philadelphia, but has not yet vacated the premises. New property has been purchased on the northwest corner of Rosehill street and East Allegheny avenue, where such changes as may be necessary will probably be made in the building already on the site. The company is also building an addition to its Worcester foundry and increasing the foundry capacity at its works at Providence, Rhode Island.

The Keystone Tire & Rubber Co., Inc., Keystone Building, New York City, has expanded its system of chain stores for automobile tires and tubes so that the number is now 171. They are to be found in every state in the Union and in all the important cities. Each is incorporated separately as a subsidiary of the parent company. The company expects \$20,000,000 worth of business a year.

A. J. Sandhoff, who has been interested in various lines of rubber production for many years, has been made assistant superintendent of the Habirshaw Electric Cable Co., Yonkers, New York. Mr. Sandhoff had been connected with rubber companies in the middle west for the past six years.

Adolph Hirsch & Co., Inc., 53 Park Row, New York City, has been incorporated by Adolph and I. Henry Hirsch, the members of the former copartnership of Adolph Hirsch & Co., to continue the business of importing rubber and other products from Brazil. The officers are: Adolph Hirsch, president; I. Henry Hirsch, vice-president and treasurer; and Arthur A. Glass, secretary.

The following tire and rubber companies incorporated within the last few years in the State of New York, have been dissolved: Durable Tire Co., Ironclad Tire Co., Overroad Tire Co., Queen Rubber Co., and the Worthmore Tire Co. The address of all at the time of incorporation was 1789 Broadway, New York City.

The L. H. Butcher Co., Inc., having outgrown its quarters, has removed from 100 William street to 239 Front street, New York City, where it has consolidated its office and warehouse in the five-story and basement building on which it has taken a long

term lease. Increased quantities of color and chemical stocks will be carried.

The Pennsylvania Rubber Co., Jeannette, Pennsylvania, has elected George W. Daum assistant general manager, while H. Wilfred DuPuy has resigned his position as treasurer in favor of A. H. Price.

The Vulcanized Rubber Co., of Morrisville, Pennsylvania, is erecting a new brick office building 80 by 120 feet, adjoining its plant.

J. F. Sieberling, son of F. A. Seiberling, president of The Goodyear Tire & Rubber Co., Akron, Ohio, has been elected president of the New Castle Rubber Co., located at New Castle, Pennsylvania.

GOODRICH ADVERTISING DIRECTOR.

THE APPOINTMENT of E. D. Gibbs as advertising director of The B. F. Goodrich Co., Akron, Ohio, is in line with the policy of that company in maintaining its publicity campaign among the leading advertisers of the country.

E. D. Gibbs.

Mr. Gibbs has a national reputation in the advertising world. For twelve years he was advertising director of the National Cash Register Co., Dayton, Ohio, during which time he built up one of the largest advertising organizations in the country and gathered about him a staff of experts in every branch of publicity. Under his direction the company acquired the second largest printing plant owned by a private corporation.

Resigning his position there, Mr. Gibbs associated himself with Robert Patterson, former vice-president of the National Cash

Register Co. and conducted a business in Chicago as advertising and sales counsel. Five years later he took charge of the publicity of the Bush Terminal Co., New York City, resigning that position to become associated with The B. F. Goodrich Co.

His appointment as advertising director is in harmony with plans of H. E. Raymond, first vice-president, to be relieved of the supervision of the company's advertising and concentrates the full direction of advertising under the personal supervision of W. O. Rutherford, second vice-president. Mr. Gibbs' appointment in no way disturbs the present advertising department, which will be continued as heretofore under the direction of E. C. Tibbetts, advertising manager.

Mr. Gibbs has gained a reputation as a writer and lecturer on advertising topics and has been prominently identified with the development of advertising, having held the office of president of the Associated Advertising Clubs of the World, of the Sphinx Club of New York and the New York Sales Managers Club. He is also a charter member of the Sphinx Club of London, England.

THE RUBBER TRADE IN OHIO.

By Our Regular Correspondent.

IN THE ACCOMPANYING ILLUSTRATION, the upper picture shows the reunion dinner given in October by The B. F. Goodrich Co., Akron, to those of its employees, men and women, who had been in its service for twenty or more years. B. G. Work, president, presented gold service pins to 160 men, all but twenty-four of whom are still on active duty. The pins bear the company's "wreath and G" and four stars, each star representing five years with the concern. In two cases father and son went up together; there were cases of two and of three brothers having

served the twenty years together; six of the veterans were women.

Among the officials who have served twenty years or more are: B. G. Work, president; H. E. Raymond, C. B. Raymond, H. K. Raymond, and W. A. Means, vice-presidents; and E. C. Shaw, a director. Among the speakers was Percy Leavitt,

THE GOODRICH REUNION OF LONG SERVICE EMPLOYEES.

GOODRICH WORKING FORCE IN 1873.

whose portrait is shown, who has been with the company for thirty-nine years. He read a history of the company, illustrated with slides, describing his experiences during that period. The lower group represents the entire working force of the Goodrich company in 1873, numbering less than 100 where to-day it is more than 20,000.

AKRON NOTES.

The Housing Bureau of The B. F. Goodrich Co. is offering to employ the opportunity of buying homes by the payment of \$700 to \$900 down and the balance in monthly instalments. The houses are now being constructed in one of Akron's residential districts and will sell for from \$7,000 to \$9,000.

Liberty Park is henceforth to be called "New Goodrich Field" until familiarity with the name makes "Goodrich Field" sufficient. Improvements are to be made during the coming season, and it is expected that the park will be made one of the finest industrial athletic fields in the country.

A. G. Underwood, until recently manager for The B. F. Goodrich Co., Akron, in Milwaukee, Wisconsin, has succeeded H. M. Bacon as sales manager for Diamond Tires and accessories.

J. C. Lawrence, assistant treasurer of The B. F. Goodrich Co., Akron, has been assigned to the post of director of branch operations, succeeding C. E. Cook, who is now director of mechanical sales.

T. B. Tomkinson, connected with The B. F. Goodrich Co. since its merger with the Diamond Rubber Co., has been promoted to the position of assistant to the comptroller of the company.

He began his career in the rubber industry as a cost clerk for the Diamond Rubber Co. and was brought into prominence because of his intimate knowledge of the company's business at the time of the merger, after which he was made assistant auditor, a position which he held until his recent promotion.

E. C. Shaw, for many years vice-president of The B. F. Goodrich Co., is working energetically for increased facilities for the prevention and cure of tuberculosis in Akron. He is also head of the committee which will erect one of the most extensive polyclinics in the world as a memorial to the Akron soldiers and sailors who participated in the world war. The latest move made by Mr. Shaw is the taking over by Summit County of a large sanitarium formerly operated by five counties.

Employees of the Firestone Tire & Rubber Co., Akron, were

offered until October 6 to purchase from one to five shares of seven per cent preferred stock of the company in addition to that to which they were entitled as common stockholders.

The Firestone Tire & Rubber Co., Akron, entertained 100 local tire dealers at luncheon September 24 and took them through plant No. 2 which has recently been put into operation. The luncheon was given to introduce George H. Bacon, formerly of Baltimore, Maryland, who has recently been appointed manager of the local sales branch of the company. It was announced that the output of the company has been increased from 22,000 to 36,000 tires per day for the coming year.

E. C. Vermilion, for the past year identified with the Americanization work of the Firestone Tire & Rubber Co., has been made director of Americanization work of the public schools following the resignation of E. P. Wiles, formerly of Cleveland.

The latest development in industrial sports in Akron is the formation of an industrial polo league, under the management of J. D. Thomas, formerly county treasurer. The Firestone Tire & Rubber Co., The B. F. Goodrich Co., The Goodyear Tire & Rubber Co. and The Miller Rubber Co. are among the rubber factories who have joined the league. The games are to be played in a local amusement park.

The Miller Athletic Association of The Miller Rubber Co., Akron, has won the industrial tennis championship of the city.

The Akron Rubber Mold & Machine Co., Akron, has neither changed hands nor is considering such a move. To the contrary, the officers of the company, consisting of S. W. Harris, president and general manager; W. E. Wilson, vice-president and assistant general manager, and G. F. Hobach, secretary and treasurer, are all active in their respective positions and authorize the announcement that decision has been reached to purchase and install new equipment and increase the size of the plant, which will enable the company to take care of its rapidly increasing business and insure improved service on deliveries to its customers.

Arthur H. Leavitt, who returned to The B. F. Goodrich Co., Akron, in charge of pneumatic truck tire and motor products sales when he received his discharge as major in the Motor Transport Corps, has resigned to accept the position of assistant sales manager with The Akron Rubber Mold & Machine Co., Akron. He had been with the Goodrich company eight years prior to 1917, when he was the first Goodrich employee to enlist.

The Portage Rubber Co., Akron and Barberton, has elected M. S. Long president in place of W. W. Wildman, resigned. The following appointments have also been made: H. M. Kerr, formerly auditor of factory costs and accounts for The B. F. Goodrich Co., Akron, controller; E. W. McCreery, formerly assistant sales manager of the Republic Rubber Co., Youngstown, Ohio, assistant sales manager; B. M. Schreckengost, special factory representative with headquarters at the factory.

The company has ordered the preparation of plans and specifications for a three-story reinforced concrete addition to the factory, to cost approximately \$200,000.

The Rubber City Clearing House Co., Akron, has increased its capitalization from \$200,000 to \$500,000, and is building a four-story building of modern construction, 125 by 150 feet with railroad frontage, which will cost approximately \$150,000. The concern deals in blemished seconds and surplus stocks of tires and also in raincoats, rubber shoes, hot-water bottles, etc., in the nature of seconds.

The India Tire & Rubber Co., Akron and Mogadore, Ohio, has appointed William G. Lerch superintendent. He was formerly in charge of tire production for The Miller Rubber Co., Akron.

The insurance plan of The Goodyear Tire & Rubber Co., Akron, recently adopted, operates on a service basis and not on

that of salary. Employees may carry as high as \$5,000 insurance after 20 years with the company. Ten years entitles a man to \$2,000 and 15 to \$2,500. The initial policy is for \$1,000. These amounts are not affected by the State Workmen's Compensation Fund.

The Goodyear Tire & Rubber Co. has been cited by the War Department for its part in the war. The flag which was given the company as an acknowledgment of its patriotism is hanging in the lobby of the factory office of the company.

Miss Gertrude V. Seiberling, daughter of F. A. Seiberling, president of The Goodyear Tire & Rubber Co., Akron, was married to John L. Handy on October 4, 1919, at Stan Hywet Hall, the Seiberling residence.

The American championship in balloon racing was won by Ralph H. Upson, pilot of the balloon "Goodyear II" of the Akron Aero Club, when he won the recent race which started October 1 from St. Louis, Missouri. Upson was the seventh out of the ten contestants to report landing and the fourth to land in Canada, coming down at 8:55 p. m. October 2 at Dunham, Quebec, in a severe thunderstorm. The duration of the trip was 26 2/3 hours and the straight line distance, 1,020 miles. Upson also won the 1913 race and R. A. D. Preston, another Goodyear man whose picture appeared in THE INDIA RUBBER WORLD for November 1, 1918, won in 1914. Both Upson and Preston are therefore qualified to enter the international balloon race in 1920.

"Every foreign-born workman speaking English and no man without his first papers by 1921," is the slogan of The Goodyear Tire & Rubber Co. in its Americanization program, aided by the factory school where aliens are taught to read, write, and speak English. There are now 61 classes weekly, and the entire course consists of 250 hours of class-room work in three grades comprising conversational English, history and government, and the ideals of Americanization. Each student is advanced to the next higher class as soon as capable.

CLEVELAND NOTES.

The Thermoid Rubber Co., Trenton, New Jersey, has opened a local sales office at 1302-1303 Swetland Building, Cleveland, in charge of H. R. Portugal. Carl A. Schell, in charge of engineering, also has his headquarters at the same place.

The D. & M. Cord Tire Co., Engineers Building, Cleveland, is building a one-story brick building, 140 by 220 feet, for the exclusive manufacture of cord tires, and is planning a three-story brick, steel, and concrete building, 120 by 285 feet, to be started during the coming year. The manufacture of inner tubes will be postponed until completion of the latter building. The production of cord tires is planned to start about February 1, 1920.

The McElrath Tire & Rubber Co., Cleveland, has accepted the factory site offered by the Chamber of Commerce of Ravenna, Ohio, which consists of ten acres of land west of the Erie railroad depot, adjoining the railroad on Oakwood street. The formal acceptance written the Ravenna Chamber of Commerce, signed by R. P. McElrath as president of the company, was dropped in a box from an airplane so that it landed on the new factory site. Ground will be broken in the near future.

The Zenith Tire & Rubber Co., Leader Building, Cleveland, has purchased 236 acres of land at the east edge of the city, between Euclid avenue and the Nickel Plate and New York Central railroads. Plans are being prepared for a group of buildings consisting of a power plant, main factory, and administration building, to cost approximately \$1,000,000. Construction work will start early next year.

MISCELLANEOUS OHIO NOTES

The Pennsylvania Rubber Co., East Jeannette, Pennsylvania, has opened a branch office at 120 East 8th street, Cincinnati, in

charge of J. G. Smith, recently returned from overseas where he served as a lieutenant in Germany.

The Kelly-Springfield Tire Co., New York City, has leased for ten years the six-story and basement building at 212-214 East 8th street, Cincinnati, Ohio, where the Cincinnati branch will be established.

Announcement has been made by the Rubber Products Co., at Barberton, that its output of tires will be doubled within the next sixty or ninety days. A large factory addition was recently completed and is now being equipped with machinery. This concern is comparatively new in the tire business, having first engaged in it only two years before the war. Previous to that time it specialized on rubber sundries only.

The vice-president and factory manager of The Master Tire & Rubber Co., Dayton, Ohio, George H. Witsaman, has had 18 years' active experience in the tire industry. He was with The B. F. Goodrich Co., Akron, from 1901 to 1908, being the sixth man in its employ to build automobile tires. From 1908 to 1915, Mr. Witsaman was with The Dayton Rubber Manufacturing Co., Dayton, as superintendent, and from 1917 to June 1, 1919, as factory manager. In the interim from 1915 to 1917 he was experimental and construction engineer in the experimental department of The Goodyear Tire & Rubber Co., Akron. Mr. Witsaman remained with the Dayton company until

G. H. WITSAMAN.

June 1 of the present year when he resigned to assist in the formation of The Master Tire & Rubber Co.

A convention of managers and salesmen including the export manager of The Mason Tire & Rubber Co., Kent, Ohio, was held October 9-10, for the purpose of going over in detail the policies of the company for the coming year. Branch managers from all over the country were present.

The Steele-Allderfer Co., Cuyahoga Falls, Ohio, manufacturer of wooden crates for transporting tires, hose reels, etc., has increased its capital stock from \$85,000 to \$250,000, to take care of its increasing business. Ground has been broken for the erection of a number of fireproof buildings, and the present main structure will be enlarged by a two-story addition, 60 by 100 feet. The new buildings will include a two-story one, 40 by 100 feet, to accommodate a new large band sawmill; a new office building; a garage; and a dry kiln. Electrical machinery will be installed and a traveling crane to replace the present derrick system for handling logs. The officers of the company are: T. A. Steele, president; Charles McCuskey, vice-president; W. H. Schnabel, secretary; F. R. Steele, treasurer.

Charles J. Hazen has been appointed advertising manager of The Marathon Tire and Rubber Co., Cuyahoga Falls, Ohio.

The Perfect Rubber Co., Mansfield, Ohio, plans to begin the manufacture of rubber novelties, water bottles, and druggists' sundries in the near future.

The De Vilbiss Manufacturing Co., Toledo, Ohio, manufacturer of atomizers, etc., has increased its capital stock from \$700,000 to \$2,000,000 for the purpose of carrying on its increased business. It has also purchased the plant of the Lenk Wine Co., in West Toledo, to provide a new factory for its Aeron system. This includes seven brick buildings and four of wood, with a total floor space of 75,000 square feet. These will be remodeled and modernized.

The East Palestine Rubber Co., East Palestine, Ohio, at its adjourned annual meeting, elected an entirely new board of directors, namely: C. F. Adamson, J. F. Stoddard, J. H. Whitten-

berger, William G. Morris, C. F. Woods, S. B. McClure, and P. H. Murphy. The following officers were elected: C. F. Adamson, president and treasurer; S. B. McClure, vice-president; and J. F. Stoddard, secretary.

JOHN YOUNG, FIRESTONE'S CHIEF CHEMIST.

JOHN YOUNG, chief chemist of the Firestone Tire & Rubber Co., Akron, Ohio, was born in Perth, Scotland, in 1886 and educated at Perth Academy and the Royal Technical College at Glasgow, taking degrees with honors in organic chemistry.

JOHN YOUNG.

Mr. Young started as assistant chemist with Thomas de la Rue & Co., London, England, his investigations being principally on gums and mucilages, printing inks and paper, and hard rubber for fountain pens. Later he proceeded to British Guinea, being appointed assistant chemist on a rubber and sugar plantation, and during his two years' stay there, he had charge of all the scientific work in connection with the rubber production, including collection and setting out of seeds and seedlings, fertilization experiments, investigation of plant diseases, collection and coagulation of latex.

In 1911 he went to Akron, Ohio, to work in the research laboratory of the Diamond Rubber Co., under Dr. Spence, and while there he published several papers, in collaboration with Dr. Spence, on the theory of vulcanization.

In January, 1916, Mr. Young was appointed assistant chief chemist of the Firestone Tire & Rubber Co., and later in the same year was promoted to the position of chief chemist, in this capacity having charge of the general and research laboratory, and all compounding work and factory control. Early in 1917 it was found necessary to enlarge the department, and a new set of laboratories was equipped to take care of the growing needs of the department which now has a staff of 45 well trained men.

Mr. Young passed examination for associateship of the Institute of Chemistry of Great Britain and Ireland in 1909 and was elected a Fellow of the Institute of Chemistry in 1914. He was elected a Fellow of the Chemical Society of London and a member of the Society of Chemical Industry in 1910. He is also a member of the American Chemical Society.

MID-WESTERN NOTES.

By Our Regular Correspondent.

THE PORTAGE RUBBER CO., Akron and Barberton, Ohio, has appointed the following new branch managers in the Middle West: Chicago—J. V. Wedgewood, succeeding J. W. Wildman, resigned; Minneapolis—W. R. McCarty, succeeding L. T. Ware, resigned; Detroit—S. R. Waller, succeeding L. T. MacGregor, resigned.

The Victor Rubber Co., Springfield, Ohio, has opened a branch at 1720 South Michigan avenue, Chicago, Illinois, with F. A. Richards as branch manager and George Hoff as office manager. Mr. Richards was formerly with the McGraw Tire & Rubber Co., Cleveland and East Palestine, Ohio, and Mr. Hoff comes from the Detroit office of the Victor company.

The Pennsylvania Rubber Co., Jeannette, Pennsylvania, has appointed Daniel McAvoy in charge of its branch at Omaha, Nebraska.

The Federal Rubber Co. of Illinois, Cudahy, Wisconsin, has appointed J. W. Culver, formerly district manager of the Boston Woven Hose & Rubber Co., as manager of its mechanical rubber goods division.

The Racine Rubber Co., Racine, Wisconsin, is building a four-story brick addition with basement, 175 by 80 feet. New equipment is being installed in the company's power house, including additional boilers and a low-pressure turbine with direct-connected generator. The cost of these improvements will be approximately \$500,000 and it is expected that the plant will be ready for full operation about the first of February. L. T. Vance is vice-president and general factory manager.

The Surety Tire & Rubber Co., St. Louis, Missouri, has increased its capitalization to \$1,500,000.

The International India Rubber Corp., South Bend, Indiana, is building an addition to its plant which will give it 4,000 extra square feet of floor space for storage purposes. A new factory building will also be erected at an early date.

Charles E. Miller, of the Anderson Rubber Works, Anderson, Indiana, is building additions to the plant to add about 40,000 square feet of floor space, making the total available floor space about 100,000 square feet when these improvements are completed. One building is 108 by 108 feet, with basement, and all are of concrete, steel, and brick construction. It is expected that the new buildings will be roofed in by the end of November and will be operating in the spring after the installation of new machinery for the manufacture of the company's tires and rubber-working machinery.

The B. F. Goodrich Rubber Co., Akron, Ohio, has appointed Frank S. Thrope local manager succeeding J. B. Olson at its store at South Bend, Indiana.

The Indiana Cord Tire Co. has removed from South Bend, Indiana, to Mishawaka, Indiana, the adjoining town. The company manufactures the "cord-inner-tire" composed of cord fabric with a breaker strip. R. W. Thomas is president and A. A. Peterson is treasurer and general manager.

The Palmer Tire & Rubber Co., St. Joseph, Michigan, manufacturer of Palmer safety cord tubes and Palmer molded tubes, contemplates the building of an addition to its factory next year so as to enable it to manufacture a tire by a process designed by its president, John E. Palmer.

The Canton-Blackstone Co., Youngstown, Ohio, has received authorization to do business in the State of Michigan with a capital stock of \$15,000. Arthur L. Irish is secretary.

W. P. Kastner, 2125 Michigan avenue, Chicago, Illinois, who makes a specialty of dealing in rims and rim parts for automobiles which have not been recently manufactured, has opened a branch at 1741 Woodward avenue, Detroit, Michigan, with N. J. Gender as manager. Standard equipment is also carried.

The Jaxon Steel Products Division of the General Motors Corp., Jackson, Michigan, manufacturer of automobile wheel rims, is enlarging its plant at an approximate cost of \$250,000, to include two one-story buildings, 100 by 460 feet, respectively, which will be completed at an early date.

SOUTHERN NOTES.

Jack Miller has been appointed special Texas representative of The Portage Tire & Rubber Co., Akron and Barberton, Ohio, with headquarters in Dallas, Texas.

The Hibbs Rubber Co., 200 South Boaz street, Fort Worth, Texas, has recently purchased a 20-acre site on the outskirts of the city, on which it will build a modern three-story factory building. This company has recently installed at Houston, Texas, a complete tire rebuilding plant equipped throughout with its own special machinery. It is also shipping this machinery into other states. C. D. Hibbs, the president, is the originator of the process and patentee of the machinery used in rebuilding tires by the Hibbs method.

The Firestone Tire & Rubber Co., Akron, Ohio, has appointed R. L. Benham manager at its branch at Houston, Texas. M. T. Smith, one of Firestone's city salesmen in San Antonio, has gone to Houston with Mr. Benham.

The Black & Decker Manufacturing Co., Baltimore, Maryland, has broken ground for a new and larger building, 100 by 200 feet, to be erected west of the present factory and connected with it. It will be of steel and brick construction to conform architecturally with the eight residences the company is building on Joppa Road, and will be finished like them in stucco. It is expected that the new unit will be completed by December 1 so that operation may begin soon after the first of next year. The company has already moved its general offices from 105 South Calvert street to Towson Heights, Baltimore.

The Kelly-Springfield Tire Co., New York City, has awarded the contract for its new plant at Cumberland, Maryland. This will cost approximately \$8,000,000 and will be ready for operation in May, 1920. The capacity will be 10,000 tires and 5,000 truck tires daily. The company's "Caterpillar" truck tire is meeting with great success.

The Portage Rubber Co., Akron and Barberton, Ohio, has promoted A. M. Fisher to the position of sales manager at its branch at Atlanta, Georgia, succeeding J. D. Pasho, resigned.

The Pennsylvania Rubber Co., East Jeannette, Pennsylvania, has opened a branch office at Charlotte, North Carolina, in charge of John D. Williamson, formerly North Carolina representative of the company.

THE RUBBER TRADE ON THE PACIFIC COAST.

By Our Regular Correspondent.

LOS ANGELES NOTES.

ASOT PARK, the site of the new plant of the Goodyear Tire & Rubber Co. of California, at Los Angeles, is now the scene of great activity. Construction work is being rushed on a tire factory building 580 by 300 feet, of steel and brick, a warehouse 580 by 340 feet, and a cotton fabric mill 580 by 130 feet. The ultimate plans call for enlargement to four times the initial capacity.

The steel strike in the East has to some extent interfered with the construction of the California Goodyear plant, but the work is progressing as rapidly as possible under the circumstances, and the company expects to be able to use as many as 4,000 workmen by the first of March. Practically all the men who assist in building the plant will be given an opportunity to stay with the concern and to learn the tire-making business.

The Goodyear company at Akron, Ohio, has turned over to the California company its established business in the states of California, Oregon, Washington, Idaho, Montana, Utah, Nevada, Wyoming, Colorado, Arizona, New Mexico, and Hawaii. Until the completion of the Los Angeles plant, the Akron company will supply the California one at wholesale. A. F. Osterloh, secretary of the Akron company, has arrived in Los Angeles to assume the active management and succeeds Harry Chandler as vice-president of the California company. He is also vice-president and general manager of the Pacific Cotton Mills Co.

The Pennsylvania Rubber Co., Jeannette, Pennsylvania, has opened a branch office at Los Angeles. The manager in charge is Mr. Edelman, who was formerly with the company's branch at Omaha, Nebraska.

An active movement in support of the plan to make Los Angeles the cotton handling and shipping center of the Pacific coast is urged by the California Development Board. The board in its bulletin explains that the cotton production of the Southwest will reach approximately \$43,000,000 this year, which is considerably more than half the value of the citrus crop. This is urged as a reason why the United States Railroad Administration should grant the city rates designed to develop this new industry of Los Angeles. It is believed that making Los Angeles a con-

centration point will have the effect of greatly stimulating production, as there are many thousands of acres in the Southwest on which cotton can be grown successfully.

The first Southern California motor-truck tour, which ended in Los Angeles recently, proved to be a highly successful event. The caravan was a concrete demonstration to cities, towns and rural communities of the economy and reliability of the motor truck. Los Angeles tire dealers, automobile and business men are now talking of making it an annual event like the farm tractor demonstration. Thousands of persons in cities, towns and along the highways gathered to see the trucks go by and to get an idea of what the motor truck will mean to them in future transportation matters. The first section of the caravan included a motorcycle and side car for the train captain, a pilot car for the tour manager, and a scout truck entered by the Automobile Club of Southern California. Then came a giant motor tire engine followed by a line of 21 trucks of nearly as many makes, all carrying capacity loads, varying from hay to drug store supplies.

A new departure for tire companies is the establishment at various points by the Miller Tire Sales Co., of Los Angeles, of tire service stations for its customers.

The Planet Rubber Co., Los Angeles, has completed arrangements for the marketing of its new stock issue, the proceeds of which will be used for the enlargement of its plant.

SAN FRANCISCO NOTES.

The Pacific Rubber Co., in order to take care of its increased business, has opened a branch in San Francisco at 150 Mission street. P. H. Stortz, the company's sales manager in Los Angeles, who has an extensive business acquaintance throughout the state, has been given charge.

W. C. Fitzgerald, manager of the San Francisco branch of the Mohawk Rubber Co., has made arrangement with the National Tire & Rubber Co., of that city, to distribute its tires through Contra Costa and Alameda counties.

The Pacific Coast Rubber & Supply Co., Inc., 316 Mission street, San Francisco, is now controlled by the following officers, who hold all of its stock: Irvin Reed, president and manager; Henry D. Byrne, vice-president; Frank C. Stephens, secretary and treasurer. Mr. Reed was formerly Pacific Coast manager of the Republic Rubber Co., Youngstown, Ohio. Mr. Byrne was a member of the old firm, Squires & Byrne Rubber Co., Pacific Coast jobbers.

The Hewitt Rubber Co. of California, 1210 Claus Spreckels Building, San Francisco, is the Pacific Coast division of the Hewitt Rubber Co., Buffalo, New York, and is in charge of Charles W. Harris. This office also controls the company's business in Hawaii and the Philippines. Pacific Coast distributors have been appointed as follows: Howard & Litchfield, 700 Polk street, San Francisco; General Auto Supply Co., Broadway at Hobart street, Oakland, northern California; J. B. Wood Tire Co., 927 South Hill street, Los Angeles, southern California and Arizona; American Tire & Rubber Co., Broadway at Oak street, Portland, Oregon; Tomford Tire Co., 2115 Fourth street, Seattle, Washington.

Salesmen of the Samson Tire & Rubber Corporation, of Compton, California, in the Los Angeles district, held an enthusiastic meeting at the factory during the past month. A. Seicher, president of the concern, gave a talk upon the technicalities of salesmanship, at the same time explaining the salient points of tire construction.

MISCELLANEOUS WESTERN NOTES.

The Kelly-Springfield Tire Co., New York City, has opened the following branches on the Pacific Coast: Bakersfield, California, J. E. Bradley; Fresno, California, W. A. Kidwell; Portland, Oregon, C. H. Mead; Seattle, Washington, H. M. Gagne.

The cotton crop of the Tucson, Arizona, section is expected to reach 800 bales this year, valued at about \$200,000. An exhibit of the local long staple will be displayed at New Orleans at the World Cotton Congress, under the direction of H. Lyon, managing editor of the "Tucson Citizen." Local growers are preparing to undertake a campaign to destroy the wild cotton plants near the cultivated cotton fields of the Santa Cruz Valley with funds contributed by the State Horticultural Board and the county of Pima. No particular danger from the boll weevil which infects these plants is feared, as the variety of the weevil is not the same as that which has done damage in the southern fields, but it is considered best to take proper precautions. It is thought that this species of weevil cannot live through the summer heat of Arizona.

The International India Rubber Corp., South Bend, Indiana, has appointed C. H. Mayer manager of its western district, including the states of California, Arizona, Utah, Nevada, Idaho, Oregon and Washington. Mr. Mayer was formerly with the United States Rubber Co. at San Francisco, Seattle, and Portland, and was its branch manager in the latter city for a number of years.

NORTHWESTERN NOTES.

The Northwestern Tire Corporation, with Jack Rosenstrob as president and manager, has opened quarters at 444 Stark street, Portland, Oregon, for the distribution of the Keystone, National, Speedway and Batavia tires. The Northwestern Tire Corporation is one of 145 similar stores in the principal cities of the United States from one coast to the other. It will do both a wholesale and retail tire business.

Frazar & Co., New York City, manufacturers of chemicals for the rubber trade, have opened an office at Seattle, Washington, to facilitate Pacific Coast exports and imports.

CANADIAN NOTES.

By Our Regular Correspondent.

THE CANADIAN CONSOLIDATED RUBBER CO., Limited, Montreal, Quebec, has made the following changes in its officers and directorate: directors—Sir Charles G. Gordon succeeds R. C. Colt, Lieutenant-Colonel Herbert Molson, M. C., succeeds Ernest Hopkinson, and W. Binmore succeeds Hugo Wellein. J. G. Barrows has been made an assistant treasurer and Walter Binmore has assumed the duties of treasurer in addition to those of secretary of the company.

The Ames Holden Tire Co., Limited, a subsidiary of Ames-Holden-McCready, Limited, Montreal, Quebec, has nearly completed its new plant at Kitchener, Ontario, including a main building 400 by 90 feet, two stories in height, and a power house, machine shop, laboratory, office, and cement house.

The new plant of the Mount Royal Rubber Co., 1399 Messier street, Montreal, Quebec, is shortly to be completed and machinery is due to arrive this month. Talmon H. Rieder is president of the company.

The Montreal Waterproof and Clothing Co., Montreal, Quebec, has increased its capital from \$99,000 to \$198,000.

W. A. Black, vice-president and general manager of the Ogilvie Co., Montreal, Quebec, has been elected a director of Ames-Holden-McCready, Limited, of the same city.

Ames-Holden-McCready, Limited, Montreal, Quebec, has opened branches in Regina and Saskatoon, of which L. T. McGivern will have charge.

The Columbus Rubber Co. of Montreal, Limited, Montreal, Quebec, has established a complete line of rubber footwear at its warehouse at 41 Princess street, Winnipeg, Manitoba. G. W. Barrett is manager. G. H. Connolly is manager of the company's branch warehouse at 709 Second street, west, Calgary, Alberta.

The Rubber Trade in Great Britain.

By Our Regular Correspondent.

THE ACTIVITIES of the Rubber Growers' Association in the way of finding new outlets for the use of rubber can hardly be considered superfluous in view of the fact that despite the general European demand the stocks in England are larger than at any previous period. It has been difficult to find storage room for all the rubber arriving, and Liverpool and Manchester stores are being utilized, in addition to the London headquarters. The fact that ships have had to wait as long as four weeks at Liverpool to discharge has not troubled the rubber manufacturer, though it has proved annoying to associated interests. Fine hard Pará at 2s. 6d. per pound continues to show an increase of 7d. per pound when washed, over its plantation rival, and the fact remains that this premium continues much the same as was the case ten years ago despite all the efforts that have been made by plantation interests to show that there is no solid grounds for the belief in its superiority.

RATES OF EXCHANGE.

A main topic of discussion with regard to foreign business is the rates of exchange, the present position of affairs not having been generally foreseen. Although the European countries are in the worst position, the state of affairs is not favorable to American exporters. At the time of writing a conference called by the United States Chamber of Commerce is discussing in New York the proposed standardization of rates of exchange, and a leading part in the conference is being played by Marshall Stevens, M. P., chairman of the Xylos Rubber Co., Limited, Trafford Park, Manchester.

TRADE CONDITIONS.

Trade generally is brisk, nearly all departments of the rubber industry reporting themselves busy. At the same time competition is keen and more goods of inferior quality are being made than has been the case during the last few years. The prevailing labor unrest is responsible for a matter which is proving of considerable annoyance to those dealers placing large contracts. I refer to the clause now general in contract that prices may be raised before delivery. The clause is generally as follows: "Our price is based on the present rates of labor and material and is subject to our confirmation on receipt of order. Should any increase come into effect before completion of the order our contract price to be increased accordingly." The buyer in some cases may be excused for an uncomfortable feeling that the "accordingly" may prove to be somewhat excessive as he has no means of checking the calculations. Still if these terms are not complied with there is but little chance of the business maturing. The proofing trade keeps busy and difficulty has been experienced in obtaining a sufficient number of hands. Owing to the high price of other outer coats and umbrellas the waterproof is being more generally worn than used to be the case, though it is a poor substitute for a great coat. One does not naturally see much of rubber and fiber soles for boots, but I was told by a manufacturer specializing in this material that he was bombarded with orders. An article for which there is a great demand at present on the Continent, particularly in France, is card clothing for cotton mills. The mills have to be set going again and the British supplies of card clothing are not bothered with the new French import tax on rubber goods as they sell by special arrangement to a department of the French Government which is financing the mills.

WOMEN IN RUBBER MILLS.

As stated in THE INDIA RUBBER WORLD of September 1, 1919, it certainly seems to be the fact that women workers in the rubber industry—I refer especially to those taken on during the war—

are less seriously affected by the peace than was thought would be the case. In recent visits to rubber factories I have noticed women still at work on the rolls, wet mixing mills, spreading machines, etc., work which was formerly done exclusively by men. It would appear that where an old hand does not claim his job the woman is allowed to go on.

LEYLAND & BIRMINGHAM RUBBER CO., LIMITED.

At the annual meeting of the Leyland & Birmingham Rubber Co., Limited, held in September, with R. T. Byrne in the chair, a dividend of 15 per cent was declared out of the disposable balance of £83,936; £10,000 was put to reserve, making it £75,000, and £46,543 was carried forward against last year's £28,933. In discussing the state of affairs at the various works at Leyland, Glasgow, Pierton and Mitcham, and at the foreign branch depots, the chairman spoke seriously on the labor position. After mentioning the considerable advances in wages and the system adopted of a bonus on output, he regretted to say that in common with many other industries in the country, they had suffered by the pernicious and suicidal policy of limitation of output which was still being pursued in many directions. He did not mind 47 hours or high wages, but he did ask for production and in a great many departments they were not getting it by a long way. It was seriously to be hoped that the operatives would realize the inevitable result of that disastrous policy before home and foreign trade was more seriously affected.

At an extraordinary general meeting a resolution was passed authorizing alteration of the articles of association so as to enable the directors to increase the capital of the company in view of the suggested capitalization of the reserves.

A NEW AMALGAMATION.

The United Rubber Producers, Limited, has been formed with a capital of £250,000, to acquire works for the production of rubber goods for the cycle, motor and allied trades. One works already acquired is the New Turco Rubber Co., Limited, of Clayton, Manchester, and another one is being negotiated for as a going concern. The Turco company is sole owners of two processes for the manufacture of rubber, which are expected to cause something of a revolution in the industry. The rebuilding of tires is to form a prominent part of the new company's business, this being a branch of the trade not hitherto taken up in England, though I understand it is well developed in America. It is stated that the rebuilt tire can be retailed at about one-third of the price of a new tire. In this connection I may remark that the government tires which were offered to reclaimers as scrap rubber had been purposely cut through. Whether this was to prevent them being rebuilt I cannot say. Rubber sponges are also to be an important article manufactured, Louis Alexander, the chairman of the new company, having been closely related with Mr. Leeson, formerly of the New Turco company, in the formation, a few years ago, of the Sorbo Rubber Sponge Products, Limited, whose works are near London.

COHEN & WILKS EXONERATED.

The name of this Manchester firm of waterproofers was adversely referred to in a recent report of the Parliamentary Committee inquiring into alleged defections in the Women's Royal Air Force. A Court of the Air Force was subsequently appointed to inquire into this and various other aspersions and the result of their findings is that Messrs. Cohen & Wilks and Mr. Cohen, a member of the firm, are completely exonerated from charges in connection with contracts for coats

and skirts, made by Miss O'Sullivan, assistant commandant and clothing controller of the force. The main charge was that the garments were cut on the bias, but the court found that only the sample coat was thus cut, the deliveries not being cut in that way after the lady had complained to Mr. Cohen. It was not found that the contract negated this form of cutting by which only a few inches of cloth per garment would have been saved. The result of the charges generally was that no one, either inspectors, officers or contractors, was really to blame for anything which had occurred, a somewhat common result when departments hold their own courts of inquiry.

LONDON BUSES.

A rubber authority has expressed the opinion that in less than two years all London buses will be running on pneumatic tires.

PROPOSED BRITISH ROAD TAXES INCLUDE TIRES.

Suggestions for keeping British roads in repair by the taxation of vehicles, are made in the "Financial Times," as neither the Government nor the local rates provide sufficient money for the purpose. It is proposed to tax automobiles according to weight on a progressive scale, so that a car weighing a ton would pay ten guineas or about fifty dollars and a car weighing a ton and a half would pay 465 shillings or about \$116. The proceeds would be devoted wholly to keeping the roads in order. It also is proposed to tax pleasure cars in proportion to the dust they raise and to impose extra taxes on tires that cut up the road. English makers might thus be driven to manufacture lighter cars which could compete with the American makes in the colonies and the foreign markets.

AN ASSOCIATION OF JAPANESE CRUDE RUBBER MERCHANTS.

The leading crude rubber merchants of Osaka and Kobe, Japan, have organized the Osaka and Kobe Crude Rubber Merchants' Association with headquarters at the offices of Y. Miyagawa & Co., the standing manager, in Kobe. The other members are Otomune Shoten, Limited, and the Yuasa Trading Co., Limited, both of Osaka, the Masuda Trading Co., Limited, and Mitsui Bussan Kaisha, both of Kobe. The latter firm will act as accountant's supervisor. The by-laws of the association prescribe the procedure in all the transactions and disputes of members.

Other Kobe members include the Ito-Cho Shoten, Imaeda Ryutaro Shoten, Oyawa Shokai, Limited, Ogura Sutejiro Shoten, Kawanishi Zembei Shoten, Kato Shokai, Takahashi Brothe Shokai, Tsubara Hilcojiro Shoten, Naigai Boyalci Kaisha, Limited, Nanyo Yashi Kaisha, Limited, Kuhara Shoji Kaisha, Limited, Miyazaki Tatsujiro Shoten and Sugimura Sataro Shoten.

The other Osaka members are Higashi-Indo Trading Co., Limited, Kawahara Girolisi Shoten, Furusawa Shoji Kaisha, Limited, Mitsui Bussan Kaisha and Gomei Kaisha.

FRENCH RUBBER STATISTICS.

Crude rubber was imported into France in 1918 to the extent of 18,957 tons—a decrease of 3,644 tons as compared with the preceding year; 197 tons came from the United States and 12,910 from Great Britain. The importations of manufactured rubber declined from 7,070 tons in 1917 to 6,526 in 1918. The United States furnished 2,863 tons of manufactured rubber in 1918 as compared with 2,705 tons in 1917; while imports for these two years from Great Britain were 3,138 tons and 4,146 tons, respectively.

In the past six months of 1919, France imported 39,588,664 pounds of crude and reclaimed rubber, value \$29,907,400, the official figures quoted by "Le Caoutchouc et la Gutta Percha." Of this 1,899,924 pounds came from French West Africa, 601,194 pounds from Senegal, 548,504 pounds from the French Congo;

England contributed 15,782,070 pounds, the British East Indies 10,185,354 pounds, Brazil 4,687,861 pounds, and other countries 5,882,755 pounds.

The imports of January-June, 1918, were 21,787,655 pounds, valued \$16,080,000, and in 1917, 29,159,142 pounds, valued \$19,697,000. The value of the manufactured rubber goods imported was \$25,374,400 in the first six months of 1919, \$11,078,800 in the same months of 1918, and \$14,962,000 in 1917.

The exports of crude and reclaimed rubber, January-June, 1919, were valued \$4,886,400; in 1918 they were 4,471,812 pounds and in 1917 7,678,022 pounds. Manufactured goods to the amount of \$15,112,400 were exported January-June, 1919.

DR. ANDRÉ DUBOSC, C. E.

THE LIKENESS here shown is that of the noted French chemist, André Dubosc, editor in chief of our valued contemporary, *Le Caoutchouc et la Gutta Percha*.

DR. ANDRÉ DUBOSC.

M. Dubosc's name stands high in the investigation and chemistry of rubber, and his books are standard in the literature of the rubber industry. His work, in collaboration with Dr. A. Luttiger, "Le Caoutchouc; Sa Chimie Nouvelle; Ses Synthèses," published in Paris in 1914, and in English later in this country, shows deep research and is a valuable contribution on the subject. Equally valuable is his "Les Cholestérols, au Point de Vue Scientifique et Industriel."

M. Dubosc is a tireless investigator, and a prolific writer, particularly on rubber chemistry. Among his studies and conclusions may be mentioned the recommendation of the use of formic acid, in place of sulphuric acid in reclaiming; the discovery of a new process for separating pure rubber from combined sulphur in reclaimings; a method of determining the amount of uncombined rubber in reclaimed vulcanized rubber; an investigation of the treating of crude jelutong with acetone and ether; a study of the various methods of analysis of the sulphides of antimony; of the influence of hypophosphites on colored crepe rubber; a review of catalysis and its application to vulcanization; essays on rubber substitutes, etc. Many of these were prepared for and published in THE INDIA RUBBER WORLD. His briefs of the work of contemporary scientists, as published in his own journal, show a complete grasp of the subjects, much research and keen observation.

M. Dubosc visited the United States in 1915-1916, and one result of his inspection and investigation here was the instituting in Paris of a course in chemistry applied to rubber, similar to those in this country, in England and in Germany, the classes being held in his laboratory in Paris.

FRENCH TESTS OF PNEUMATIC AND SOLID TIRES.

AN IMPORTANT PARIS TRANSPORTATION COMPANY HAS 100 TRUCKS of 2½ tons capacity running on dual pneumatics and is convinced that, for a 2½-ton load the pneumatic tire is superior to the solid because of its lower cost of maintenance and the greater tonnage transported by reason of the higher average speed. The experience of this firm is that with six-inch dual tires on the rear and the same size single on the front, the average tire life is 7,500 miles on the front wheels and 5,000 miles on the rear. There is reason to believe that if these trucks had been

designed originally for use with pneumatic tires the mileage would have been higher.

Tests to ascertain the comparative advantages of solid and pneumatic tires for trucks were made by the Michelin company in France, using a pair of 2½-ton trucks worked side by side, one of these trucks being on solid tires and the other on six-inch dual pneumatics. These tests lasted five months during which time the solid-tired truck ran 6,523 miles and the pneumatic-tired truck, 9,631 miles. The tests were brought to a close when the solid-tired truck became unfit for further service, a rear wheel being broken and the steering pivots very badly worn. The increased mileage, by reason of the higher average speed of the pneumatic-tired truck and the absence of visits to the repair shop amounted to about 50 per cent.

The following advantages in favor of pneumatics were noted as the outcome of these tests:

1. Lower cost of repairs and maintenance.
2. Increased tonnage transported by reason of the higher average speed.
3. Lower physical effort for the driver.
4. Better performance on snow or on heavy clay roads.
5. Truck less dependent on road surface.

Tire makers are not all certain that the pneumatic tire competes with the solid for heavy haulage, certain ones holding to the opinion that each type of tire has its distinct field. In France the opinion is growing that modern large-size pneumatics can compete with solids and such tire equipment is being offered for useful loads of 2 to 3½ tons.

It is maintained that the 10 and 12-inch tire does not give any better riding qualities than a couple of six-inch, while it has the disadvantages of very high cost, great weight, and difficulty of fitting.

In France only the soft-bead tire is known and some of the difficulties of mounting would disappear with the use of the straight-side tire. In France, too, the value of the detachable steel disk wheel has been thoroughly established by the severe tests of war service. ("Automotive Industries.")

THE RECONSTRUCTION OF GERMANY'S RUBBER INDUSTRY.

HAMBURG AS A RUBBER MARKET.

HAMBURG as a world market for middle grade rubber is a thing of the past. The fact must be faced that only comparatively small quantities of "wild" rubber, with the exception of the Pará qualities, will be collected and shipped to Europe. The experience of Liverpool, which was an important market for this kind of rubber, has been, during the war, that the drop in the price of rubber to about 50 cents a pound for the best plantation grades has killed what interest the producers had in collecting wild rubber so that they have turned their attention to other raw materials.

This will naturally affect Hamburg also, which will find besides in Amsterdam a new rival for the world rubber trade in addition to her former competitors, Antwerp and London, which have the advantage not only of dealing with their own colonies but of controlling abundant free capital in the hands of enterprising traders. The output of the Dutch East Indies plantations, which are owned almost exclusively in Holland, amounting to over 50,000 tons a year, will be shipped for the most part to Amsterdam or will at any rate be marketed there.

It will take all the enterprise, the combined effort and perfect organization of Hamburg business men to contend against the influence of the foreign markets and secure for Hamburg independence in trading and in the direct importation of plantation rubber to supply the needs of the German rubber industry.

GERMAN TRADE NOTES.

German Government control of industries keeps on. Small dealers in waste and reclaimed rubber are ordered, by a decree

issued May 13, 1919, to turn over whatever stock they gather to twenty-two specified firms in Frankfurt am Main, Hanover, Berlin, Hamburg, Dresden, Leipzig, Köln, Minden, Breslau and Lübeck.

The German Government has sanctioned importation of foreign motor tires, under license; unlicensed importations will be confiscated. The "Gummi-Zeitung" criticizes the measure sharply; it sees no reason for hurrying automobile business before German manufacturers are able to procure rubber and to have their chance to compete. The Continental Caoutchouc & Guttapercha Co. has published a protest against the sanction.

A "Protective Association of Inventors" has been formed in Berlin, which asks a government subvention to further its objects, which are to see that German inventors are protected in their patent rights, which have suffered much from irregularities of all kinds during the war, and also to further the use of German inventions wherever they are likely to serve German interests and the reconstruction of German industries.

HOLLAND'S RUBBER MANUFACTURING INDUSTRY GROWS.

When the war broke out in 1914 the principal manufacturers of rubber goods in Holland were, Hevea at Hoogeveen, Pompe at Amsterdam, Hollandsche Draad & Kahelfabriek, also at Amsterdam, Gebr. Merens at Haarlem, St. Joris, better known as Bakker, at Ridderkerk and Vredestein at Loosduinen. Many of these extended their operations during the war and the first two amalgamated with some other firms in the N. V. Vereenigde Nederlandsche Rubber Fabrieken, which has erected very large works at Doorwerth near Oosterbeek. Many new firms have gone into the manufacture of rubber articles, so that in the first months of 1919 there were 29 factories, large and small, in Holland where crude rubber was turned into finished articles.

The closing of the ports created a great demand for tires of all descriptions; rubber insulated wire, which had before been mostly imported, was made by the Hollandsche Draht & Kahelfabriek; the making of ebonite wares for the electro-technical industries was developed. The war introduced into Holland the cold vulcanizing process and the manufacture of surgical gloves and fingers, supplies, tobacco pouches, balloons, dentists' supplies, valve tubing, waterproof sheeting, erasers and so on. The little pilot balloons used by the Royal Meteorological Institute, which used to be imported, are now home made and a beginning attempted in the manufacture of tennis balls.

ALUMINUM LATEX CUPS.

That latex cups made of aluminum are in use on rubber plantations is well known and not particularly interesting. But the fact that they are made in the United States and by the

hundred thousands is another matter and worthy of more than passing notice.

The cup shown here is an American product made from a straight sheet of pure aluminum, No. 25 B. & S. gage, and goes through six operations before the cup assumes its final shape. The cups are finally cleaned in an acid bath

NESTING TAPPING CUPS.

and dried in hot sawdust. The fact that they nest is a convenience, not only in shipping but on the plantation as well. (American Metal Works, 4865 Stenton avenue, Philadelphia, Pennsylvania.)

- 129,917. Footstarch support. T. Coffey, 901 South Mabel street, Tulsa, Okla.
129,965. Life-saving garment. D. Del Re, Iron River, Mich., U. S. A. (Not yet accepted.)

ISSUED SEPTEMBER 24, 1919.

- 130,147. Artificial feet with rubber cushions to restrain ankle movement. W. H. Tressider, trading as W. R. Grossmith, 12 Burleigh street, Strand, London, Surrey.
130,280. Boot sole with top and bottom layers of wood and one or more intermediate layers of rubber, canvas, etc. V. Buckland, 68 Windmill Road, West Croydon, Surrey.
130,282. Rubber band stamp with means for adjusting tension and dismounting. F. Fitman, Bulla-Harre, Campbell street, East Kew, Victoria, Australia.

THE FRENCH REPUBLIC.

PATENTS ISSUED, WITH DATES OF APPLICATION.

- 491,067. (July 29, 1918.) Holder for cup and dripping spout in tapping. K. Kavenas Rubber Co.
491,113. (February 3, 1915.) Elastic insulated fender as lining for bullet-proof carriages. A. Delille-Dainger, G. de St. Marc, and S. de Szegnyik.
491,373. (July 6, 1918.) Pneumatic valve. Holt Auto Devices Co.
491,378. (October 5, 1918.) Improvements in leggings. Mme. E. Charlier, 36 B. F. Bergmann.
492,311. (May 17, 1918.) Respiratory apparatus for use in rarified atmospheres. J. F. S. Kent.
492,330. (October 16, 1918.) Hose coupling. J. P. Gagné.
492,350. (September 28, 1918.) Resilient tire for vehicle wheels. J. A. Allaire.
492,384. (October 18, 1918.) Improvements in rubber heels. R. W. Brockett.
492,419. (September 28, 1916.) Apparatus for walking on the water. E. Y. Gong, U. S. A.
492,421. (October 6, 1916.) Floating apparatus for walking on the water. P. Géné.
492,438. (October 22, 1918.) Life-saving suit. J. E. Lepage.
492,603. (October 28, 1918.) Sectional casing for pneumatic tires. Société Anonyme Berendek's Syndicat voor Banden en Deelen.
492,605. (October 30, 1918.) Non-skidding tire casing. E. Héritier, 96 rue d'Annonay, Saint-Etienne (Loire).
492,614. (October 1, 1915.) Casing. G. R. Delattre.
492,643. (October 1, 1918.) Improvements in hollow bodies made of rubberized cord fabric, and their process of manufacture. T. Sloper.
492,771. (December 24, 1915.) Gas mask permitting prolonged stay in unbreathable atmospheres. J. Tissot.
492,863. (August 27, 1918.) Tire improvements. Morand Bros. and Martin Cushman Wheel Co., Chicago, Ill., U. S. A.
492,844. Life-saving vest. Mme. Beaumont, etc. O. Newman.
20,859/483,349. (May 16, 1918.) First certificate of addition to patent dated November 1, 1916, for improvements in stylographic and other fountain pens. D. Cameron.

TRADE MARKS.

THE UNITED STATES.

- N. O. 112,581. The word LIBERTY above representation of statue of Liberty on horizontal rectangle beside vertical rectangle—rubber tire patch. Liberty Patch Co., Oklahoma, Okla.
113,078. The word AUTOGRAPH—fountain pens. Charles R. Keeran, Chicago, Ill.
114,256. The initials R & L enclosed in a rectangle—rubber overshoes. Rosman & Laveson, Philadelphia, Pa.
115,189. The word SAFESKIP—sheets of paper or paper and textile combined, plain or treated by coating or impregnation to be waterproof, for use in wrapping tires, etc. Safeskip Mills, Boston, Mass.
115,744. Conventional combination of the words VICTORY TIRES so arranged that the letter T serves in both words while the ends of its crosspiece are formed into the letters V and N—pneumatic tires and inner tubes. Victory Tire & Rubber Co., New York City.
116,048. The word TIRELESS—pneumatic and solid tires. Demas Armorer-Cast Tire Saving Co., Inc., Pittsburgh, Pa.
116,200. The word LILY—dress shields. Brooklyn Shield & Rubber Co., Brooklyn, N. Y.
116,353. The word SAWYER—fountain pens, erasers, etc. Samuel Ward Manufacturing Co., Boston, Mass.
117,499. The letters O and N connected by representation of a scroll bearing the word ORANGE—rubber and balata belting, etc. Olmsted-Flint Co., Cambridge, Mass.
117,634. The word ARMORCOLD—inner tubes. Armorcold Rubber Co., Morcanown, W. Va., and Washington, D. C.
117,733. The word MAYFLOWER—rubber heels and soles. Mayflower Rubber Works Co., Braintree, Mass.
117,916. The words W. Co. PATENT—proof dressing for textile fabrics. The words W. Co. PATENT—proof dressing for textile fabrics.
118,040. The word EXCELSIOR—belting, hose and packing. Boston Belting Corp., Boston, Mass.
118,413. The word VULCAN—treads and panels for stairways, floors, etc., composed of broken masses of hard mineral matter embedded in and matrix of vulcanized rubber. American Abrasive Metals Co., New York City.
118,554. The representation of a cross within a triple circle and the word HANES arranged within the cross vertically and horizontally so that the letter N serves in both words—tires and inner tubes. Hanes Rubber Co., Winston-Salem, N. C.
118,730. The words UNION HEAVY separated by representation of two hearts, one superimposed on the other—tires and inner tubes. Marius Greenspan, Chicago, Ill.

- 118,762. The word "Mimco" quoted—tires and tubes. The Mid-Continent Tire Manufacturing Co., Wichita, Kans.
118,879. The word FLUXO—laminated rubber and leather belts for motor vehicles. Detroit Leather Works, Detroit, Mich.
118,898. The word USCO—rubber pump-valves. United States Rubber Co., New Brunswick, N. J., and New York City.
119,818. Representation of a cross and a part of an arrow separated by the word VICTOS just above the cross, rubber offset-blanks. Vulcan Printing Co., Brooklyn, N. Y.
119,906. The word SPOKE—rubber, a sort of tread fabric.
119,947. The word OMO having a pair of wings spreading upward from the word, and a part of an arrow pointing downward from the word, waterproof treated fabric. The Omo Manufacturing Co., Middletown, Conn.
120,242. The word WILSON—sole—fabric coverings for rubber tires. George W. Eno Rubber Co., Los Angeles, Calif.
120,492. The initials O. K. D.—golf balls. Harry C. Lee & Co., New York City.

THE DOMINION OF CANADA.

- 2,866. The word VETERAN—rubber tires, footwear, hose, belting, and water bags. John M. Percy, Toronto, Ont.
2,879. Representation of label bearing words DICK'S PACKING and representation of two hands holding a twisted rope—packing and hose of all kinds. W. F. and J. A. Dick trading as Dick's Adhesives, Ltd., London, Eng.
2,882. The words CANADIAN BEAUTY and representation of a rose—rubber packing rings, jar rings, hose, and tires. Dunlop Tire & Rubber Goods Co., Limited, Montreal, Que.
2,884. Representation of two crossed snowshoes and a sunken shield—rubber boots, shoes, overshoes, and other footwear composed of a number of parts. Canadian Consolidated Rubber Co., Limited, Montreal, Que.
2,900. The words FACILITIES CHEWS—chewing gum. The Faultless Chemical Co., Baltimore, Md., U. S. A.
2,897. The word "IRIS" and a representation of the flower iris—elastic webs, sandalines, and cords, and rubber threads, cloths, and dress shields. Fair Bros. & Co., Limited, 2 Southampton street and St. George's Mills, Leicester, Eng.
2,898. The word "LILY" and a representation of a lily—elastic webs and cords. Fair Bros. & Co., Limited, 2 Southampton street and St. George's Mills, Leicester, Eng.
2,899. The words "THE ROSE" and the representation of a rose—elastic webs and cords. Fair Bros. & Co., Limited, 2 Southampton street and St. George's Mills, Leicester, Eng.
4,000. The word "VIOLET" and the representation of a violet—elastic webs, sandalines, and cords, rubber threads, cloths, and dress shields. Fair Bros. & Co., Limited, 2 Southampton street and St. George's Mills, Leicester, Eng.
2,901. The word "PANSY" and the representation of a pansy—elastic webs, sandalines, and cords, rubber threads, cloths, and dress shields. Fair Bros. & Co., Limited, 2 Southampton street and St. George's Mills, Leicester, Eng.
2,902. The word "SNOWDROP" and the representation of a snowdrop—elastic webs, sandalines, and cords, rubber threads, cloths, and dress shields. Fair Bros. & Co., Limited, 2 Southampton street and St. George's Mills, Leicester, Eng.
2,939. The words "MOUNTAIN GOLF TIRES WITH GOLF HOOF TREADS"—automobile tires. Frank W. Bull, Oshawa, Ont.
2,986. The word "TRIANGLE" within an equilateral triangle—rubber boots, shoes, overshoes, and other footwear composed wholly of rubber or rubber compositions. Canadian Consolidated Rubber Co., Limited, Montreal, Que.
25,081. The words "THREAD RUBBER" between two concentric circles and the letter W inside the inner circle—storage batteries and parts. Willard Storage Battery Co., Cleveland, O., U. S. A.
25,087. The word "IBEX"—tires. Frank Wesley Bull, Oshawa, Ont.
25,102. The word "SELICES" chewing gum, etc. Charles W. Pike, San Francisco, Calif., U. S. A.
25,122. The word "MADEIRA"—tennis balls, water bottles, fountain and combination syringes, face and ice bags. United Drug Co., Limited, Toronto, Ont.
25,127. The word "SYMBOL"—druggists' sundries. United Drug Co., Limited, Toronto, Ont.
25,128. The word "REPUTATION"—druggists' sundries. United Drug Co., Limited, Toronto, Ont.
25,168. The word "REDMON"—rubber-lined cotton hose, etc. F. Reidway & Co., Limited, Victoria, British Columbia, and Penenden, Manchester, Lancashire County, Eng.

Review of the Crude Rubber Market.

NEW YORK.

THROUGHOUT OCTOBER the rubber market has been very firm, with a steady and improving demand from the factories that has raised the price of plantation rubbers both here and abroad. The fluctuations in prices have been within narrow limits. At the close of the month prices were being strongly maintained. The Brazil market has been practically dead, the increase of production keeps the price down; it has become so unimportant that dealers take little interest in it. The market for guayule and balata has also been quiet. Prices for plantation and for South American rubber at the beginning and toward the close of the month are shown in the following quotations:

PLANTATION HEVEA. September 27, first latex crepe, spot 50-51½ cents, October-December 50¼ cents, January-March 51 cents, January-June 51-51½ cents, July-December, 1920, 52 cents, October 24, spot 53 cents, futures 53 cents, July-December, 1920, 53½ cents.

September 27, ribbed smoked sheet 49½ cents, October-December 49½ cents, January-March 50 cents, January-June 50 cents, July-December, 1920, 51 cents, October 24, spot 52 cents, futures 52 cents, July-December, 1920, 52½ cents.

September 27, No. 1 amber crepe, spot 47 cents, October 24, spot 49-50 cents.

September 27, clear thin brown crepe, spot 46 cents, October 24, spot 44-46 cents.

September 27, No. 1 roll brown crepe, spot 36½ cents, October 24, spot 40-41 cents.

SOUTH AMERICAN PARA AND CAUCHO. Spot prices: September 27, upriver fine 54 cents, islands fine 47 cents, upriver coarse 33¼ cents, islands coarse 21¼ cents, Cametá coarse 22 cents, caucho ball 33¾ cents. October 24, spot prices practically unchanged.

NEW YORK QUOTATIONS.

RECLAIMED RUBBER.

The reclaimed rubber market has shown marked improvement the past month. Boot and shoe reclaimers have been in strong demand due to activity in the carriage cloth, automobile topping and insulated wire trades. There has been slight improvement also in the call for tire reclaimers by the mechanical goods trade. Prices remain unchanged from last month's quotations.

THE MARKET FOR COMMERCIAL PAPER.

In regard to the financial situation, Albert B. Beers, broker in crude rubber and commercial paper, No. 68 William street, New York City, advises as follows:

"During October there has been a fair demand for paper, mostly from out-of-town banks, and the best rubber names have been taken at 5½ to 5¼ per cent, and those not so well known 6 to 6½ per cent."

ANTWERP RUBBER MARKET.

GRISAR & CO., Antwerp, report (October 31, 1919):
The market has continued firm during the past week although the demand has quieted down somewhat. The stock in Antwerp was 2,234 tons. Business in futures was a little quieter, 132,500 kilograms were registered. Prices at closing ranged from 9.45 to 9.55 francs.

SINGAPORE WEEKLY RUBBER REPORT.

GUTHRIE & CO., LIMITED, Singapore, report [September 14, 1919]: Influenced partly by advices of higher values in London, the rubber auctions which opened on Wednesday showed further advances in prices. At the commencement fine pale crepe realized up to 85½ cents per pound (three lots sold at 86 cents), showing an advance on the week of 3½ cents. Rubbed smoked sheet was in good demand at 84½ cents (two lots realized 85½ cents), which figure is 6 cents up on the week.

On the second day the tone of the market was distinctly easier and closing prices may be given as 84½ cents for crepe and 83½ for sheets. Lower grades were in good demand at 2½/4½ cents advance on last week.

The quantity cataloged was 1,035 tons, of which 948 tons were offered and 738 tons sold.

The following is the course of values:

	In Singapore, per Pound.	Sterling Equivalent per Pound in London.
Sheet, fine ribbed smoked	84c @ 85c	1/11½ @ 2/2
Sheet, good ribbed smoked.....	81c @ 83c	1/10 @ 2/1
Crepe, fine pale.....	85½ @ 87c	2/0 @ 2/1
Crepe, good pale.....	75 @ 83	1/0 @ 2/2

*Quoted in S. S. Currency — \$1 = \$0.567.

AMSTERDAM MARKET REPORT.

JOOSTEN & JANSSEN, Amsterdam, report [October 24, 1919]: During the past week the rubber market was very animated. Several parcels spot and afloat, c.i.f. Amsterdam, changed hands and also a part of the new arrivals, originally destined for subscription sale, were sold privately, on a basis of about 1 3/8-1 4/2% for Hevea standard quality.

On the terminal market, too, some contracts were closed for November and March delivery at f. l. 39 and for delivery in August at f. l. 38½.

BATAVIA RUBBER MARKET.

HERMANS, MARSMAN & CO., Batavia, report [July 15-August 15, 1919]: The market opened with a very weak tendency and prices decreased to \$456 for fine pale crepe and \$448 for prime smoked sheets. In the beginning of this month price improved a little on account of more demand from the United States. Speculators are paying good prices for October-December delivery, but only little is offered for this forward delivery. The market closed with the following quotations:

	In Batavia Per ½ kilo. Guelders.	Equivalent Per ½ kilo. U. S. Currency.
Fine pale crepe.....	1.20	\$0.480
First pale crepe.....	1.15	0.460
Prime smoked sheets.....	1.17	0.468
Prime pale crepe 75 per cent.....	1.12	0.448

* Quoted per ½ kilo (1.1 lb.) in Dutch Indian guilders (\$0.40).

STRAITS SETTLEMENTS RUBBER EXPORTS.

An official report from Singapore states that the export of rubber from Straits Settlements ports in the month of August amounted to 8,933 tons (of which 1,286 tons were transshipments), which compares with 7,818 tons in July, and 1,249 tons in the corresponding month last year. The total for eight months of the present year is 99,476 tons, compared with 45,407 tons in 1918 and 50,653 tons in 1917. Comparative statistics follow:

	1917.	1918.	1919.
January.....	3,746	4,700	4,700
February.....	6,495	2,314	15,661
March.....	8,209	8,858	30,908
April.....	6,103	6,584	10,848
May.....	6,629	13,587	15,845
June.....	8,725	6,515	5,059
July.....	7,351	1,978	7,818
August.....	3,786	1,249	8,933
Totals.....	50,653	45,407	99,476

FEDERATED MALAY STATES RUBBER EXPORTS.

An official report from Kuala Lumpur states that the Federated Malay States exported 10,626 tons of plantation rubber in the month of August, as against 8,640 tons in July and 5,291 tons in the corresponding month last year. The total export for eight months amounted to 69,983 tons, compared with 51,554 tons for the corresponding period in 1918 and 51,761 tons in 1917. Appended are the comparative statistics:

	1917.	1918.	1919.
January.....	5,995	7,588	7,163
February.....	7,250	6,839	10,809
March.....	7,088	6,709	10,679
April.....	5,955	7,428	7,664
May.....	7,177	5,851	7,008
June.....	6,609	5,161	2,606
July.....	5,798	5,706	8,640
August.....	6,487	5,291	10,626
Totals.....	51,761	51,554	69,983

(Compiled by The Rubber Association of America, Inc.)

TYRE MAKING MACHINE

SYSTEM "A. MATHERN"

The most widely used in Europe, owing to its perfection and simplicity in use. Millions of Tyres have been made on this machine during the last ten years.

Sole Maker: A. MATHERN, Zollikon - Zurich, Switzerland

F. CHASSAING, 307, Beckenham Road, Beckenham, LONDON.

SOLE AGENTS FOR

Great Britain, Belgium, Holland, Denmark, Sweden, Norway and the United States of America

The contract between The Batavia Rubber Company and the Keystone Tire & Rubber Company for the purchase by the Keystone Company of the output of the factory of The Batavia Rubber Company has been terminated and the latter Company is now selling its tires direct to the trade.

THE BATAVIA RUBBER COMPANY

Batavia, N. Y.

New York Office—52 Wall Street

THE MARKET FOR RUBBER SCRAP.

NEW YORK.

THERE has been hardly any change in the rubber scrap market since a month ago. Manufacturers have been buying in small lots, the interest being centered around boots and shoes and standard auto tires.

Price changes in the list since last month show a quarter of a cent advance in boots and shoes, a decline of one cent in standard white auto tires and three-eighths in solid truck tires, otherwise the list is unchanged.

THE MARKET FOR COTTON AND OTHER FABRICS.

NEW YORK.

IN OCTOBER after hovering around 32 cents for a time with sharp fluctuations, the spot price for middling uplands cotton advanced steadily and reached 36.60 cents on October 24. Speculation was based on the conviction that the crop would be even shorter than the government estimate and that the quality would be poor. Rain and bad weather spoiled the cotton and interfered with picking the cotton in season, while the insect pests abounded, the boll weevil appearing further north than ever before. The

demand is very great and the prospect is that prices will be extremely high.

EGYPTIAN COTTON. The supply of Egyptian cotton has been larger than was expected for the crop was good, though the staple was shorter than usual in many cases, owing to the native trick of cutting off the water in order to force the boll to open early. The high price offered offset in some degree English competition.

From the first to the middle of October, prices advanced sharply but later in the month the market fell off, medium Sakelaries bring quoted 58½ cents and medium uppers at 56 cents.

AMERICAN-EGYPTIAN. Arizona has yielded the largest crop yet produced, but this, combined with imported Egyptian, will not make up for the deficiency due to the shortage of Sea Island cotton. A fair amount of this cotton has been marketed and the demand, although somewhat restricted, continues to take care of the output of all gins. Prices have held steadily around 68 and 70 cents for the best grades.

SEA ISLAND COTTON. Sea Island cotton conditions show no change, with an exceedingly small crop in prospect. The government estimate of 15,000 bales will probably be reduced at the end of the year. Good grades are demanding very high prices. Probably a good grade of average extra choice could be bought for 70 cents.

TIRE FABRICS. The market is very strong. Increased production of tires and the condition of the cotton crop, with the increased shortage in long staple, make it impossible for the mills

to meet the demand. The product is sold substantially to the end of 1920.

OTHER FABRICS. A like excess of demand over supply prevails with other cotton fabrics. For waterproofing materials, for sheetings, for hose and belting, for drills and ducks it is the same story of goods very scarce and deliveries for next year only. Asbestos cloth and yarns are hard to get; there are almost no imports from England and none from Germany.

(Compiled by John Malloch & Co., Savannah, Georgia.)

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

NEW YORK.

IN COMMON with other important industries the rubber trade is suffering from the abnormal freight and labor conditions prevalent. In New York movement of all water-borne freight has been stopped for weeks. These conditions have stimulated demand for spot stocks and raised prices. In some lines production is very much oversold and deliveries postponed.

ANILINE OIL. Almost impossible to obtain at present from spot stock. Futures are booked so far that manufacturers cannot name a price or promise deliveries a month or six weeks ahead.

BARYTES. Stocks very low owing to shipments being tied up by harbor strikes.

BENZOL. Spot stock at great premium, because supply in quantities is practically off the market on account of the steel strike.

GOLDEN ANTIMONY. In great demand with supply very short.

MAGNESIA, HEAVY CALCINED. Stocks short, manufacturers oversold and in some cases closed down because raw supplies cannot be obtained owing to freight and labor troubles.

MONTAN WAX. The first shipments since five years ago have arrived at this port and are now available.

SULPHUR. General advance in all grades since October 1.

WHITINGS. Held at a premium because stocks are very low as shipments are tied up by the longshoremen's strike.

*Nominal.

HEVEA IN SOUTHERN NIGERIA.

In southern Nigeria the *Hevea brasiliensis* seems to have become acclimated. According to the "Nigeria Gazette," 300 five-year-old trees in the Sapele district yielded an average of a pound and a half of dry rubber in 1911. In 1912 four-year-old trees at Ebrite gave an average of seven pounds, while from September, 1916, to December, 1917, 1,000 eleven-year-old trees at Agege yielded 4,337 pounds.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

TABLE OF CONTENTS ON LAST PAGE OF READING.

SALVAGING RUBBER FROM THE DEEP.

RECOVERING TREASURE FROM SUNKEN SHIPS has always been a fascinating theme for the romancers and the novelists, and yet it now promises to have its practical side. Among the millions of dollars of cargoes sunk by the Germans in their campaign of ruthlessness on the high seas were large consignments of rubber in both the crude and the manufactured state. It is pointed out that of all articles other than metals, rubber is best adapted to remain submerged for a considerable time and yet be serviceable when recovered. At last accounts, the British had succeeded in raising 210 ships and recovering a large percentage of the cargoes, despite the painstaking manner in which the Germans sunk them and endeavored to render them useless for all time.

Now that the salvagers can work without interruption in vicinities where the depth of water does not preclude such operations, there seems to be no reason why a large amount of sunken cargoes may not be brought to the surface intact. Entire ships have been raised, and a vast number were sunk in depths where it is very possible to recover their cargoes. It is even said to be feasible

in the case of the *Lusitania*, which went down in 270 feet of water with immense amounts of valuables in her hold, although the ship itself will probably always remain where the marine murderers sent her.

JAPANESE RUBBER AMBITIONS.

THAT JAPANESE RUBBER MANUFACTURERS have been taking advantage of the situation created by the war is indicated by the activity which is displayed in all branches of the industry throughout the Flowery Kingdom. Their accessibility to the rubber plantations of the Far East has enabled them to secure raw material in sufficient quantities to put full steam ahead in manufacturing and the inventive, or imitative faculties of the Nipponese have been given abundant opportunity for development, as the list of inventions published in the current Japanese rubber periodicals indicate. The "*Gomu-Shimpo-Sha*" devotes several columns in each issue to inventions credited to enterprising citizens of the Mikado's realms, some of them, doubtless but improvements, or adaptations of American and English articles on the market, but their being put forth with the Japanese trade-mark is sufficient to give them more than an equal chance with the products of their Anglo-Saxon commercial rivals.

Automobiles are of course plentiful, but the pneumatic-tired jinrikisha is in evidence everywhere. The demand for jinrikisha pneumatic tires has been extraordinary, as the reports of the tire firms indicate. There is a healthy commercial rivalry between the rubber merchants and manufacturers of Osaka and those of Tokio. Some very interesting comments on the condition of the rubber industry in Japan are contained in "The Japanese Rubber World" under the caption "Peace and the Rubber Industry."

"It is a fact," says that paper, "that rubber manufacturing and the industry in general is progressing rapidly throughout Japan. We may congratulate ourselves that the trade is of an enduring character. The price of rubber articles is cheaper than similar articles fashioned of leather, fabric or wood, particularly in regard to clothing. Particular attention should be paid by Japanese business men and manufacturers to the rapid growth of the plantation rubber industry. Enterprises of this kind fostered by Japanese capital should be pushed with all speed. Rubber in the future is destined to take the place of many materials used in this kingdom and now that peace is at hand we should do all in our power to prepare for the conditions that will ensue with the establishment of peace. Having been on a war basis for so long, the world is unprepared for the peace situation. But the conditions in the rubber business are good and the prospects are excellent. A big change is destined to be wrought in the rubber business in the future. It is safe to say that it will take the surplus rubber supply of the world two years to replace the lack of the raw material in Germany and Austria caused by the war. Similar conditions exist in other parts of the world."

"While Europe has been fighting, we have been developing our rubber manufacturing industries. Our producers have easy access to the rubber plantations of the East and they have increased their products despite the British export duties."

GERMAN SYNTHETIC ASPHALT.

ANNOUNCEMENT has been made that Dr. Zimmer, the director of the A. G. Johannes Jeserich, at Charlottenburg, Germany, has worked out a process patented in all the principal countries for the production of synthetic asphalt which will render Germany independent of foreign sources of this material. A new company known as the *Gesellschaft Synthetischer Asphalt m. b. h.*, has been organized to exploit the invention and a factory is being erected at Velten near Berlin, but unsettled conditions in Germany render it uncertain when production will begin. The new invention may mean mineral rubber and open the field for a variety of plastics.

INDUSTRIAL TRAINING AND APPRENTICESHIP.

THE POLICY of the War Department in urging manufacturers, as a help toward relieving industrial unrest and reducing the high cost of living, to undertake industrial training for their workers while at the same time paying them a living wage during their period of apprenticeship, has much to commend it. Increased production is the greatest need of the day. That it means lower prices is axiomatic, and that it must come through greater individual efficiency is self-evident.

It is estimated that some 6,000,000 workers are required in American factories to do what 4,500,000 could do if well trained. This means that the average worker is only 75 per cent efficient. By intensive government training, thousands of unskilled men in many trades were turned into skilled workers in a short time during the war, and the same method will produce similar results under corporate management.

Industrial training is the logical way to improve the situation, and manufacturers are the proper persons to undertake it. This imposes a heavy initial expense on the part of employers, but leading firms in the metal, shoe and numerous other trades that have tried the experiment agree that it is a profitable investment. Usually the workers more than pay for themselves while learning. In the rubber industry the plan has given excellent results, especially in training women engaged in footwear, drug sundry, mechanical and sporting goods factories, and may well be more generally extended to work done by men.

Employers everywhere respond eagerly to a sound plan of industrial training because it gives them an opportunity for advancement in position, earning power and living conditions. Manufacturers begin to realize that it increases plant productivity in both quantity and

quality through greater efficiency rather than expenditure; that it produces leaders to take charge of work requiring skill and intelligence, and makes for contentment among operating forces. They see that raising the level of skill and education of their workers is building the greatest future bulwark of American industry.

FADS IN INDUSTRY.

IT IS A CERTAIN SIGN OF PROGRESS that managers of industrial plants from time to time have tried out various systems for the purpose of increasing their output and improving the standard of both the workmen and managers. Perhaps some of them when subjected to close scrutiny might have been termed fads, but others have been productive of real good and there is reason for the belief that eventually a summary of these experiments will result in the adoption of a proved standardized system.

First came the epidemic of cost keeping. When this was at its height any reasonably intelligent clerk with a good address could get the job of installing a cost system. It lasted until managers of plants realized they were spending more time in ascertaining the costs of their work than in improving their production methods. Some of these systems survived, but many big plants in the country are managing to worry along without them.

Then came the efficiency slogan, which still prevails to some extent. Efficiency was heard from everywhere, and so-called efficiency experts went from factory to factory taking notes and promulgating theories. The keynote of the theories was: "If we could only make the workman efficient all would be well." It cannot be said that efficiency has been the cure-all, for despite the good it has undoubtedly done in some cases, industrial conditions in many parts of this country are deplorable. The Germans particularly devoted their energies to developing their workmen along lines of efficiency, being greatly assisted by the government which exercised strict control over many essential industries. It must be admitted that the Germans, previous to the war, had made considerable progress along these lines which was reflected by the standardized products of their factories.

Just now the owners and directors of plants are directing their attention to the improvement of the efficiency of those in control, for without efficient management it is shown that efficiency of workmen is relatively useless even if it is possible to get it. H. L. Gantt, a consulting management engineer of New York, in a recent address touched on the crux of this matter when he declared: "Our most serious trouble is incompetency in high places. As long as that remains uncorrected, no amount of efficiency in the workmen will avail very much. Can we find a measure, or even a correct indication, of that efficiency? I think we can, but we shall have to revise our methods of cost accounting, for those at present in vogue are not designed for that purpose."

Rubber—The One Normal Commodity.

By Henry C. Pearson, of *The Magazine of Wall Street.*

FOR REASONS good and sufficient, all important commodities, with the single exception of india rubber, have doubled, trebled or quadrupled in price in the last four years. Why the apparent indifference of the great gum elastic industry to the high cost germ? It is thus explained:

The real beginning of crude rubber expansion was in 1876, when the British Government succeeded in establishing a small orchard of Pará rubber trees at Peradeniya Gardens, Hencat-goda, Ceylon. This was followed by the discovery of "wound response." In plain words this means that the Pará tree, the *Hevea*, can be milked daily, while other rubber trees and vines must rest after milking for months and even years.

With cheap and docile coolie labor it was soon found that plantation rubber could be produced cheaper and of as good quality as wild rubber. And numerous plantations in Ceylon, the Straits Settlements, Federated Malay States, Java and Sumatra were established. Just as the best of these came into bearing the automobile began its spectacular career. The demand for rubber became so great that from a normal price of \$1.25 a pound it sold as high as \$3 a pound. The dividends thus earned by the plantation companies, two and three hundred per cent, set English and to a lesser degree Dutch and Belgian investors aflame, and the "Rubber Craze" ensued.

New companies were formed by the hundred and the jungles cleared and planted in record time. So great was the expansion that the 100,000 acres in existence in 1905 had expanded to nearly 2,000,000 acres at the outbreak of the Great War. And the world's annual production in that period grew from 62,000 tons to 120,000 tons. Nor did the plantations stop at that figure. In spite of the war the product for 1917 was 256,976 tons, or more than double in two years and increasing at about 50,000 tons a year. Thus it is apparent that there is plenty of rubber.

PRE-WAR CONDITIONS.

At the beginning of the war plantation rubber was low. The \$1.25 rubber had given place to a 65 to 70-cent level, and it was to sink even lower. In spite of sporadic upward flurries it worked downward until 40 cents became the purchasing price. As the cost to the planter varies from 17 to 24 cents there was still a fair margin of profit, and the planters continued to sell. This in spite of frantic efforts on the part of planters' associations and hungry stockholders to restrict output, to valorize, to do anything to enhance the price.

Keeping pace with this increase in the output of crude rubber was the spectacular demand for pneumatic tires and tubes, for solid truck tires and an increased demand for all kinds of rubber goods.

In the light of such a market almost any merchants other than the far-sighted English would have held the customer up for higher prices. To be sure the big users were already possessed of big stocks, forward sales had been negotiated and there were vast supplies of reclaimed rubber available.

It was plainly seen that it was the part of wisdom to make it to America's advantage to buy in the Far East. For should

that supply for any reason be withheld or fail, a very few years would suffice to install great plantations perhaps in Mindanao, Philippine Islands, where soil and climate are ideal, and plenty of seed available. Or the great American *Castillon* plantations in Mexico, which were about to be replanted with Pará trees in the time of Diaz, might be suddenly available were present conditions reversed. If not there, perhaps in Guatemala, Honduras, Panama, Colombia, Venezuela or Brazil. With proper governmental guaranties from the countries named and a reasonable amount of sympathetic support from one's own government great planting projects could easily be installed. Indeed, they doubtless would be if the necessity arose.

Then there is the purely domestic experiment of "machine grown" rubber, right within our own borders and eventually taking its place with such enterprises as the cultivation of the sugar beet.

Then there are the extensive fonts of the Amazon and her mighty tributaries with a wealth of rubber trees, only the fringe of which has been touched. In the event of shortage the volume of rubber from Brazil, northern and southern, and from Bolivia and Peru would be increased enormously, and Africa, once the great rival of South America, would again figure as a big rubber producer. Furthermore, several of the great American companies have installed huge Pará rubber plantations of their own in the Far East. The constantly increasing product of three orchards, one of which is the largest in the world, and said to be the most economically administered, had a wonderfully steadying effect upon the market and was assailed by jingo papers as the "American invasion." Thus it was that the planters continued to produce and to sell, and in spite of lessend cargo space and the thousand and one handicaps of a great war the price of rubber continued low.

In the meantime the American rubber business grew and grew and at the time of the signing of the armistice we were using three times as much rubber as when the war began.

PRICES DECLINE.

With such a market for manufactured goods, even if the basic material be low, prices might well be high. But they became lower and lower during the first years of the war and with only two exceptions are still far lower than those of the other commodities.

One has only to study the accompanying Lubin graphs to see how remarkably low have been manufactured rubber goods.

Low priced crude rubber does not necessarily mean low priced rubber goods. The reason is rubber goods are built up of rubber, fabrics, compounding ingredients and labor. The rubber has been cheap but everything else entering into the finished product has shared in the great advance in price.

There are some 250 separate ingredients as solvents, fillers, vulcanizing ingredients, etc., regularly used by rubber manufacturers in rubber mixing processes. The prices of some went so high as to be prohibitive. Others disappeared from the market. All increased appreciably in price. A good instance is naphtha, which went from 13 cents to 24 cents and did not

HENRY C. PEARSON.

recede. The same was true of the 50 or more types of fabrics upon which the trade was dependent. As for tools, machinery, building material, labor, all took part in the advance.

To offset this which for the moment looked like calamity there took place a rapid revolution of methods of manufacture that is one of the most remarkable incidents of a remarkable industry.

PRODUCTION SPEEDED UP.

The scarcity of skilled labor caused by the draft resulted in the invention of hundreds of machines that turned hand-made goods into machine-made and if anything bettered the product. Old machines were scrapped and everything that the best mechanical engineers could offer to speed up production was promptly adopted. Team work of man and machine was applied in all lines of manufacture.

The chemist was called upon to add his assistance. An elastic organic substance, rubber-like to a degree, of low cost, made from waste material, was so treated that it could be incorporated in the best rubber and actually added to its value. This in itself saved thousands of pounds of rubber. The time consumed in vulcanization was lessened by half by the use of catalysts, that is by accelerators, or hasteners, so that there was a notable saving in steam and labor and an increase in production.

Speaking of time conserved in vulcanization: for years the great rubber shoe industry was handicapped by the so-called dry-heat cure requiring seven hours of slow baking. A revolution in this was wrought by the pressure cure, taking but a third of the time and incidentally allowing the use of a far wider range of compounds and producing a better product at a lower cost.

The great changes, mechanical and chemical, while apparently centering about the tire and footwear business, actually occurred in a notable degree in all lines of hard and soft rubber manufacture.

Working together the members of trade assured their supply of crude rubber from England by pledging themselves to purchase only for their own consumption. When war needs practically cut off their supply of zinc oxide, the notable tire toughener, they promptly substituted a toughening black that was useless in munition work. When cotton promised to be scarce certain of the big manufacturers planted thousands of acres of cotton and built gins by the score.

The labor situation in rubber, considering the general unrest, was handled with wisdom. Strikes were few and of brief duration. Manufacturers kept ahead of the H. C. of L., as far as their help was concerned, by successive increases of wages; by instituting factory stores, markets and war gardens and by providing housing facilities on a scale never before dreamed of. By piece work, bonuses, profit-sharing, premiums, pensions, insurance and hospitals, they made work profitable and the worker secure. Reading and recreation clubs were provided and a degree of friendliness and cooperation between employer and employee was the very definite and satisfactory result.

All of these efforts helped to keep the price of rubber goods down. In 1914, 1915 and 1916 rubber goods were on the average much lower than they were in 1913. In 1917 the constantly increasing cost of all materials except crude rubber brought prices up to the pre-war level. Since then there have been advances aggregating about one-third of the rise shown in "all other products." With it all the trade has prospered as never before and with no profiteering accusations made against it.

THE OUTLOOK.

As to the future there seems to be no need for uneasiness. The American industry, besides being the biggest in the world's rubber business, is by far the best equipped mechanically, chemically and in personnel.

It is, of course, dependent upon England and to a degree upon Holland for its raw product. England, however, never plays

fast and loose with good customers, nor does Holland. Besides which we have cotton, a raw material that England needs as much as we need rubber. But beyond this is the ability of the industry to adapt itself to shortages without stopping and to provide for itself anything, anywhere, anytime.

A SUGGESTED METHOD OF PACKING SMOKED SHEETS.

Though the better plantations in the Far East use great care in packing ribbed smoked sheets, which is a standard grade of plantation rubber, still the consumer is obliged to wash the

PRESENT AND SUGGESTED METHODS COMPARED.

rubber, or at least to inspect it carefully, because dirt sifts in and splinters from the wooden cases in which the sheets are packed get mixed with the rubber. A method of packing, shown in the accompanying cuts, has been devised by The Republic Rubber Corp., Youngstown, Ohio, which should keep the contents of the cases thoroughly clean and thus save tire manufacturers time and expense. The outer sheets are made to hang over the sides of the case, and when that has been packed full the laps are turned back over the rest of the contents.

RUBBER FINANCES IN MALAYA.

The Scaport (Selangor) Rubber Estate, whose plantations are in Klang and Kuala Lumpur in Malaya, reports that in the fiscal year 1918-1919 rubber amounting to 397,500 pounds was collected, a shade less than the year before. The cost of production f.o.b. at port of shipment was 18.84 cents a pound, against 20.665 cents in 1917-18. The net sale price was 40.864 cents a pound. The profits for the year were \$95,973.71; out of these and those carried over from the year before a dividend of 12 per cent was paid out and the remainder, \$66,101.08, was carried forward to the following year.

The total planted area of the estate is 1,969 acres, of which 184 acres, planted in 1917, are not yet in bearing; the remaining 1,785 rubber yielding acres were planted between 1905 and 1914. The crop for the year ending June 30, 1920, is estimated at 550,000 pounds.

The Effect of Organic Accelerators on the Vulcanization Coefficient.¹

By D. F. Cranor.

A brief discussion of the already published work on the relationship of the mechanical properties of vulcanized rubber to the chemical composition, and a description of experiments with certain powerful accelerators which demonstrates that under certain conditions good mechanical properties can be obtained in rubber with a very low degree of chemical combination of sulphur.

DURING THE PAST FEW YEARS considerable material has been published regarding the relationship of the mechanical properties to the chemical composition of vulcanized rubber. It has been demonstrated that if vulcanization is carried to a point where maximum physical properties are obtained in the freshly cured goods, such goods are overvulcanized and subject to rapid deterioration; also, that the proper degree of vulcanization for soft rubber can be accomplished with less chemical combination of sulphur in the case of quick curing stocks, than with compounds which require prolonged heating to effect vulcanization. It is apparently quite generally believed that the coefficient of vulcanization for a properly cured pure gum mixing of good quality plantation *Hevea* rubber lies in the neighborhood of three, although it has been impossible to determine a coefficient which definitely represents the so-called optimum cure.

The fact that almost all practical rubber formulas to-day contain some one of the many organic accelerators makes further research necessary if scientific methods are to be applied to the estimation of the degree of cure of the mixings containing these substances. I have, therefore, undertaken extended work along these lines with view to making my testing methods more accurate and satisfactory. It has been the thought of the writer that results of greatest significance would be such as would indicate the amount of sulphur combination required to effect proper cure in a given sample of crude rubber, as compared with the combination necessary when the same rubber has added to it organic accelerators of various degrees of efficiency. Accordingly I have determined the physical properties and vulcanization coefficients of various samples of crude rubbers, when cured with and without accelerators, and have chosen certain series covering some of the results obtained in connection with powerful accelerators.

The determinations here described were made upon a mixing of standard ribbed smoked sheet and a sample of inferior brown plantation crepe. In both cases 100 parts of rubber were mixed with 6 parts of sulphur and 1 of zinc oxide. The latter was included in order to have the compound workable to best advantage with accelerators which exert a maximum effect only when used in the presence of zinc oxide. The sulphur was set at 6 per cent on the weight of rubber, it being desired to use enough to get a stock capable of being overcured before showing the phenomena of reversion, which has been mentioned by Schidrowitz, and at the same time one in which the amount of sulphur is sufficiently low to obviate acceleration due to an excess, thus allowing the effect of the catalysts to be most clearly demonstrated. The percentage of zinc oxide is held at a minimum, it being used only to activate the accelerators added to these mixings. Even such an amount exerts a slight retarding action on the combination of sulphur, this having been proved by Van Heurn (See THE INDIA RUBBER WORLD, page 251, February 1, 1919), and also by personal experience in our laboratory. This substance is also a factor in fixing the physical properties of the product, but it is necessary to include it in the basic formula in order to preserve the similarity of these mixtures with the treated compounds.

It will be noted by referring to Table I that the smoked sheet was vulcanized through a wide range of time changes at a vulcanizing temperature of 292 degrees F., or approximately forty-five pounds' steam pressure. All test specimens were cut by a die from sheets approximately 0.100-inch thick, which were vulcanized in an ordinary platen press, the temperature of which was controlled by a reducing valve. The tensile strength, ultimate elongation and loads required to produce definite elongation were determined by a Scott vertical combination rubber-and-fabric testing machine, the pulling jaw of which travels at a uniform rate of 20 inches per minute. The tensile product was calculated according to the method of Stevens. "Set" was determined in the case of the results recorded in Table I by stretching the specimen from one to eight inches and holding at such elongation for a period of ten minutes. The measurements were made ten minutes after releasing the samples from the jaws of the stretching device.

In the following tables the samples used for the "set" test were also stretched to eight inches, except in series where the figures for ultimate elongation are less than one to nine, in which case the samples for "set" were stretched from one to seven inches. As a matter of fact, practically no value is to be attached to the "set" results, as in many cases the figures are identical for samples having otherwise widely varying characteristics. They are inserted only to make the results complete, since the test is one which seems to be much used in general testing practice. The coefficient of vulcanization has in every instance been calculated from a direct determination of combined sulphur, made upon a sample extracted in acetone for a period of 24 hours at the boiling temperature of the solvent. The method used is the nitrate acid-bromine oxidation followed by fusion with potassium nitrate in presence of sodium carbonate. Two determinations were made upon each sample, and in almost every case the results check to within 0.10 per cent.

TABLE I.

COMPOUND A. UNVULCANIZED SMOKE SHEET, FRESHLY CURED 5 SHEETS TESTED 24 HOURS AFTER VULCANIZATION.

Minutes Curing at 292° F.	Tensile Strength Lbs. per sq. in.	Ultimate Elongation, inches.	Tensile Product, Pounds.	Load 100% E.	Load 800% E.	Set, %	Coef. of Vul.
10	1616	1.10	1402	583	1050	12.3	1.77
15	1646	9.6	1519	570	1230	12.8	1.95
115	1788	9.6	1650	680	1310	12.8	2.18
130	1856	9.6	1713	700	1330	12.8	2.25
145	2213	9.7	2064	730	1515	12.8	2.55
160	2133	9.5	1948	788	1500	12.8	4.08
175	2020	9.3	1806	883	1740	14.1	4.26
190	2313	9.6	2134	950	1840	15.6	4.76
205	2203	9.4	2060	1040	2100	6.4	5.07
220	2400	9.3	2146	1005	2010	Broken	5.25
235	120	4.5	52	Broken	Broken	Broken	5.47

It is seen with the smoked sheet that the series commences with a "heat" quite insufficient for proper vulcanization, and continues through 15 minutes' time changes to cover the entire range, including under, good and overvulcanization, and finally in the case of the last two members of the series, reversion and degradation due to overheating after the free sulphur content has been reduced to less than 1 per cent. This is especially

¹Read before the Rubber Division of the American Chemical Society at Philadelphia, Pennsylvania, September 5, 1919.

appeared in the 235-minute cure which has a strength of 120 pounds and an elongation of only 350 per cent or 1 to 4½ inches. Its superior physical characteristics were to be taken as the vulcanization criteria, the 190-minute cure which shows the greatest tensile product, or the 205-minute which shows the greatest resistance to stretching, would be selected. However, the former has a vulcanization coefficient of 4.76, and the latter of 5.07, and the author is confident that any rubber man would pronounce these pieces to be overvulcanized after making the most superficial examination. Unfortunately, insufficient time has elapsed since the original preparation of the samples to publish the results of natural weathering tests at this time. But accelerated aging test, if applied to an entire series such as this, will show those members which are decidedly over or undercured, and the results of physical and chemical tests made upon specimens so treated are, therefore, given in Table II:

TABLE II.

COMPOUND A. UNPULVERIZED SMOKE SHEET. ACCELERATED AGE RESULTS. TESTED 24 HOURS AFTER REMOVAL FROM HEATING OVEN.

Minutes Curing at 292° F.	Tensile Strength, Lbs. per sq. in.	Ultimate Elongation, Inches.	Tensile Product.	Load 700% E.	Load 800% E.	Sub. Perm. Set.	Coeff. of Vulc.
100	1673	1 to 9.3	1495	824	1060	12.5	1.97
115	1943	9.1	1700	1100	1970	12.5	2.33
130	2283	9.0	1975	1435	2283	12.5	3.15
145	1807	8.2	1424	1740	Broke	13.5	3.69
160	1235	7.4	971	Broke	Broke	4.02	5.07
175	1378	7.2	954	Broke	Broke	4.39	
190	1168	7.1	797	Broke	Broke	4.74	
205	77	4.8	28	Broke	Broke	5.13	
220	37	3.5	26	Broke	Broke	5.30	
235	9	Broke	Broke	5.43	

It is seen by the accelerated age test, that the sample cured 130 minutes, having original vulcanization coefficient of 2.85 (Table I), is the best of the series. It will be noted that this cure yields sample having a maximum strength, tensile product

FIG. 1. STRESS-STRAIN CURVES.

and the greatest resistance to stretching after the accelerated aging treatment. The selection of this as the best cured sample is well in accordance with the conclusions of Stevens in a paper read before the Society of Chemical Industry. In this it was shown that first-grade plantation rubbers vulcanized to a sulphur combination of about three stood up well during an aging period of 120 weeks, whereas those cured to a greater

degree deteriorated quite rapidly. This same figure has been indicated as the proper coefficient for a mixing of the nature in question by Spence, Kratz, Van Illeum and others.

Following the preparation and testing of the series above mentioned, the accelerators hexamethylene tetramine and dimethylammonium-dimethyl-dithiocarbamate (the addition product of dimethylamine and carbon bisulphide) were separately added to the original mixing, namely: smoked sheet 100 parts, sulphur 6 parts, zinc oxide 1 part, in the proportion of ½ of 1 per cent to the rubber contained in the batch. The former was selected as a moderately active accelerator and the other as an example of a group which probably comprises the most active accelerators known and, therefore, one of the most valuable for use in illustrating the extreme possible effects of accelerators on the mechanical and chemical properties of the resulting vulcanizates. This substance has been mentioned in the literature of rubber chemistry and should be a familiar one (see "Chemical Abstracts," January 10, 1918). The results in Table III show the effect of hexamethylene tetramine on the mixing.

TABLE III.

COMPOUND A. CONTAINING AN ADDITION OF ½ OF 1 PER CENT HEXAMETHYLENE TETRAMINE. SAMPLES TESTED 24 HOURS AFTER VULCANIZATION.

Minutes Curing at 292° F.	Tensile Strength, Lbs. per sq. in.	Ultimate Elongation, Inches.	Tensile Product.	Load 600% E.	Load 700% E.	Load 800% E.	Sub. Perm. Set.	Coeff. of Vulc.
100	1673	1 to 9.3	1495	824	1060	12.5	1.97	
115	1943	9.1	1700	1100	1970	12.5	2.33	
130	2283	9.0	1975	1435	2283	12.5	3.15	
145	1807	8.2	1424	1740	Broke	13.5	3.69	
160	1235	7.4	971	Broke	Broke	4.02	5.07	
175	1378	7.2	954	Broke	Broke	4.39		
190	1168	7.1	797	Broke	Broke	4.74		
205	77	4.8	28	Broke	Broke	5.13		
220	37	3.5	26	Broke	Broke	5.30		
235	9	Broke	Broke	5.43		

It is apparent from these figures that the compound containing this substance not only cures in about one-third the time required for vulcanization of the untreated rubber in the same formula, but the relationship of mechanical properties to chemical composition is altogether altered. If we refer the physical properties to the vulcanization coefficient as standard, by comparing the 50-minute cure with coefficient of 2.85 with the 130-minute "correct" cure of the untreated smoked sheet with coefficient of 2.85, it is seen that the "hexa" stock has 1,044 pounds per square inch greater tensile strength, one-half inch less stretch, a tensile product higher by 824, and that more than twice the load is required to stretch this stock to a given elongation. Making allowance for the toughening effect of the accelerator, the "hexa" compound is somewhat overvulcanized at the 50-minute cure.

In Table IV are indicated the results obtained by using the dimethylamine addition product at a vulcanizing temperature of 292 degrees F.

TABLE IV.

COMPOUND A. CONTAINING IN ADDITION ½ OF 1 PER CENT DIMETHYLAMMONIUM-DIMETHYL-DITHIOCARBAMATE (THE ADDITION PRODUCT OF DIMETHYLAMINE AND CARBON BISULPHIDE). SAMPLES TESTED 24 HOURS AFTER VULCANIZATION.

Minutes Curing at 292° F.	Tensile Strength, Lbs. per sq. in.	Ultimate Elongation, Inches.	Tensile Product.	Load 600% E.	Load 700% E.	Load 800% E.	Sub. Perm. Set.	Coeff. of Vulc.
1	1680	1 to 9.6	1530	375	725	1300	9.4	0.57
2	2340	9.6	2160	430	880	1675	9.4	0.77
3	2418	9.2	2140	582	1195	2207	9.4	1.09
4	2691	9.2	2303	600	1225	2398	9.4	1.21
5	2695	9.1	2363	655	1365	2508	9.4	1.45

In this instance it is seen that samples having satisfactory physical properties were obtained in vulcanizing periods of three, four and five minutes with the abnormally low coefficients of 1.09, 1.21 and 1.45, respectively. The same mixture was also vulcanized at 295 degrees F., the results being given in Table V:

TABLE V.

SAMPLES AS REPORTED IN TABLE IV CURED AT HIGHER TEMPERATURE. SAMPLES TESTED 24 HOURS AFTER VULCANIZATION.

Minutes Curing at 292° F.	Tensile Strength, Lbs. per sq. in.	Ultimate Elongation, Inches.	Tensile Product	Load 600% E.	Load 700% E.	Sub. Perm.	Coef. of Vule.
5	760	1 to 9.2	2194	710	1490	9.4	1.10
10	810	8.5	2850	1060	2330	9.4	1.39
15	827	8.4	2723	1500	2930	9.4	2.15
20	840	8.4	2734	1460	2910	12.5	2.68

NOTE: The greater degree of cure of this series as compared to that cured at 292 degrees can hardly be entirely attributed to the slight increase in temperature. It is probable that the low stock was heated to a greater degree in the course of curing.

In this series, the sample cured five minutes (coefficient 2.68) closely approaches the 2.85 coefficient of the correctly cured standard smoked sheet. Comparing the physical characteristics of these two, we find a difference of 1,554 pounds tensile strength in favor of the accelerated stock, a loss of 1.2 inches in elongation at the breaking point, a tensile product higher by 1,021, and an even greater resistance to stretching than in the case of the rubber containing hexamethylene tetramine. This sample is undoubtedly much overvulcanized.

Figure 1 shows the stress-strain curves of the three samples, all taken from the same lot of rubber and all cured to vulcanization coefficients of 2.68 to 2.85 by means of vulcanizing periods, ranging from five minutes to two hours and ten minutes. It affords a graphic illustration of the variation in physical properties referred to essentially the same vulcanization coefficient.

Figure 2, on the other hand, illustrates the range of the vulcanization coefficients for the same samples, referred to the load required to produce a uniform elongation of 700 per cent. By reference to these curves, we find that about 4.9 per cent of combined sulphur is necessary to produce a sample of untreated rubber requiring a load of 1,000 pounds to stretch it through 700 per cent. In the case of the same rubber containing an addition of $\frac{1}{2}$ of one per cent of "hexa," the same effect was produced when about 1.8 per cent of sulphur has been combined. With the introduction of the dimethylamine addition product, the corresponding coefficient drops to 0.9 per cent. Figure 2 also includes a curve representing the compound reported in Table VI, which consists of the basic formula and 1 per cent of the dimethylammonium-dimethyl-dithiocarbamate.

TABLE VI.

COMPOUND A. RIBBED SMOKE SHEET, 5 PER CENT SULPHUR AND 1 PER CENT ZINC OXIDE, TO WHICH HAS BEEN ADDED 1 PER CENT OF DIMETHYLAMMONIUM-DIMETHYL-DITHIOCARBAMATE. STOCKS CALENDERED AND STORED BETWEEN SHEETS OF HOLLAND CLOTH AT ROOM TEMPERATURE. RANGE ABOUT 70 TO 90 DEGREES F.

*Sample cut with the grain.

†Sample cut across the grain.

‡Sample cut across the grain.

§Sample cut across the grain.

These samples were not heated at all, being mixed, calendered and stored in the dark between sheets or holland cloth. The tests shown were made one month and two months after preparation, and certainly show that spontaneous vulcanization has taken place to a very considerable extent. With this mixing we find, by extending the curve toward the zero point, that this unheated material would require the load of 1,000 pounds to stretch it to 700 per cent when only 0.7 per cent of sulphur has entered into combination with the rubber. The general tendency is for the curves to flatten toward the load axis as the period of heating is reduced, and this gives some indication of the extent to which rubber is depolymerized by heat and shows that extremely low sulphur combination is sufficient to vulcanize when the period of heating is reduced to a minimum or entirely

omitted. The turn of the curve representing the untreated rubber in the neighborhood of the 5 per cent combined sulphur line again illustrated the reversion which takes place when heating is continued after the bulk of the sulphur has entered into combination. The turn at the 3 per cent point, in the case of the "hexa" sample is indicative of the great care necessary when

FIG. 2. RANGE OF VULCANIZATION COEFFICIENT.

using this substance, since if the sulphur in the compound is held down to a figure which is too low, results equally as disastrous as those coming from overcure will inevitably follow the overheating of such compounds.

Work along very similar lines was also carried out with an inferior type of brown plantation crêpe, the results of which are indicated in Tables VII and VIII:

TABLE VII.

COMPOUND A, IN WHICH INFERIOR BROWN PLANTATION CRÊPE IS SUBSTITUTED FOR STANDARD RIBBED SMOKE SHEET. SAMPLES TESTED 24 HOURS AFTER VULCANIZATION.

Minutes Curing at 292° F.	Tensile Strength, Lbs. per sq. in.	Ultimate Elongation, Inches.	Tensile Product	Load 600% E.	Load 700% E.	Sub. Perm.	Coef. of Vule.

TABLE VIII.

SAMPLE STOCK AS REPORTED IN TABLE VII, WITH ADDITION OF $\frac{1}{2}$ OF 1 PER CENT DIMETHYLAMMONIUM-DIMETHYL-DITHIOCARBAMATE. SAMPLES TESTED 24 HOURS AFTER VULCANIZATION.

Minutes Curing at 292° F.	Tensile Strength, Lbs. per sq. in.	Ultimate Elongation, Inches.	Tensile Product	Load 600% E.	Load 700% E.	Sub. Perm.	Coef. of Vule.
10	1520	1 to 8.5	1242	680	1195	12.5	...
20	2480	8.7	2074	943	1745	9.4	1.18
30	2830	8.4	2278	1383	2510	12.5	1.73
40	2910	8.4	2314	1400	2510	10.6	2.03
50	3332	8.5	2775	1420	2600	15.7	2.24
60	3090	8.5	2588	1122	2220	10.9	2.77

In this case, the figures reported are limited to the tests made on the straight rubber and the same rubber to which was added $\frac{1}{2}$ of 1 per cent of the dimethylamine-carbon bisulphide addition product. Preliminary tests on the rubber treated with hexamethylene tetramine showed that satisfactory vulcanization could only be obtained with the addition of higher proportions of zinc oxide. Figure 3 shows the complete stress-strain curves

of 120, 180, 240 and 300-minute cures at 292 degrees F. on the rubber with 6 per cent sulphur and 1 per cent zinc oxide, these being represented by the dotted line curves A, B, C and D, respectively. On the same graph there is also indicated the stress-strain curves corresponding to 1, 2, 3, 4 and 5-minute cures at 292 degrees F. in case of the same mixing containing a $\frac{3}{4}$ of one per cent addition to the powerful catalyst, these being the solid lines E, F, G, H, J and K, respectively. Addition of $\frac{1}{2}$ and $\frac{5}{8}$ of 1 per cent were not sufficient to produce good vulcanization at a temperature of 292 degrees in periods ranging from 2 to 5 minutes. These results are in general similar to those obtained by adding the accelerator to the smoked sheet, but are more notable, inasmuch as the brown cr pe was altogether incapable of being well vulcanized in its natural state, whereas through the use of the accelerator, samples having good physical properties are produced in extremely short vulcanizing periods.

It is to be noticed that the sample in Table VI cured 240 minutes and represented by Curve C in Figure 3, has all the characteristics of a technically undercured sample, although the coefficient amounts to 3.45, which is well above the 3 per cent limit mentioned for first-grade rubbers. On the other hand, the sample cured for 300 minutes is undoubtedly both overcured and overheated. The best cure would, therefore, fall between these points, but it is evident that no good cure is possible with this rubber except through treatment with chemical accelerating agents.

Although more results would be required before any definite conclusions should be drawn, the writer would summarize as follows:

SUMMARY.

(1) Although average good quality plantation *Hevea* rubbers may require a combination of sulphur of about 3 per cent to effect the proper or optimum cure, such rubbers can be vulcanized in a small fraction of the original time through the use of very powerful catalysts, together with zinc oxide, in which case excellent physical properties are obtained in samples, the vulcanization coefficient of which may be in the neighborhood of one.

(2) Inferior types of plantation rubbers which are incapable of being transformed into satisfactory vulcanizates through the

Fig. 3. COMPLETE STRESS-STRAIN CURVES.

agency of sulphur alone may be readily vulcanized in very short curing periods and at normal vulcanizing temperatures through the use of powerful accelerators in the presence of small quantities of oxide of zinc. Although such rubbers may be under-vulcanized when as much as 3½ per cent of sulphur is brought into combination through prolonged heating, good mechanical

properties may be found in samples having abnormally low vulcanization coefficients when the vulcanization is carried out with minimum heating through the use of powerful accelerators.

(3) No definite figure can be established for the vulcanization coefficient of properly vulcanized soft rubber goods in general, or for the optimum cure of any mixing in particular, for the reason that the mechanical properties, as well as the chemical combination of sulphur is influenced by the time and degree of temperature used for vulcanizing.

(4) It would appear probable, however, that in the case of any definite compound, the vulcanizing conditions could be standardized by the use of an accelerator, and that the degree of vulcanization could then be checked most accurately through determinations of the coefficient of vulcanization.

SOME METHODS OF TESTING THE HARDNESS OF VULCANIZED RUBBER.¹

By H. P. Gurney.

USUAL QUALITATIVE METHODS.

THE MOST NATURAL way for an experienced rubber man to estimate the hardness of a piece of cured rubber is to note the force required to indent it with the point of a pencil or similarly convenient means. Although practical rubber workers are thus able to distinguish very accurately between different grades

DENSIMETER. PLASTOMETER. DUROMETER.

of rubber coverings, the information acquired is of no value as a matter of record since it cannot be designated quantitatively.

QUANTITATIVE METHODS.

SPRING TYPE APPARATUS. The use of any of these different instruments for obtaining a figure expressing the hardness of rubber surfaces affords an accurate method for the comparison and recording of the quality of hardness by an arbitrarily chosen number.

In instruments of the spring type, the force is applied by means of a spring and the rubber is indented by a point of specified shape and dimensions.

The Durometer is an extremely convenient pocket instrument of this class. On its scale the hardness of glass or steel registers 100, while that of soft rubber good may register as low as 40.

At the Boston Belting Corp.'s factory, a so-called "Densimeter" has been in use for many years. This instrument is also of the spring type. A perfectly hard object has a densimeter reading of 1000, while softer objects may run as low as 250. There is one marked disadvantage in the use of the spring type of hard-

¹ Read before the Rubber Division of the American Chemical Society, at the Philadelphia meeting, September 2-6, 1919.

ness testers: namely, the existence of a noticeable variation in results due to the personal element.

DEAD WEIGHT TYPE APPARATUS. The Plastometer is an instrument of this type in which the penetration by a steel ball, of $\frac{1}{4}$ or $\frac{1}{2}$ -inch diameter, under a load of one kilogram, is read in $\frac{1}{100}$ ths of a millimeter. Owing to the fact that the downward force of the indicating dial rod is 85 grams, the depression measured is not that due to an increase of load from 0 to 1000 grams but to an increase from 85 to 1085 grams.

In the practical use of this instrument, it is recommended by the makers that the readings be taken after one minute. The advisability of observing this time element is seen when it is noted that the initial reading is about 5 per cent lower than the reading found after the lapse of 60 seconds. The reading at 20 seconds is 2 per cent lower and that at 40 seconds 0.6 per cent lower than the reading at 60 seconds.

HARDNESS AND ITS RELATION TO THE MODULUS OF ELASTICITY.

In order to get an insight into the nature of hardness, it was arranged to measure the actual depression into rubber valve samples using both the $\frac{1}{4}$ and the $\frac{1}{2}$ -inch balls of the Plastometer. This was measured in terms of the volume displaced and the force of depression. Two samples were taken, one of 40 and the other of 110 plastometer.

When charted, we find that the force-depression volume plots are nearly straight lines and are approximately the same regardless of the size of the ball used. The fact that the reading on one instrument does not always correspond exactly with a certain

reading on another, but holds true within certain limits only, is probably explained by the fact that the plots are not straight lines but are really slightly curved upward and at slightly different rates.

Hardness may be defined as the ratio of force to volume of depression and would have dimensions—

$$\frac{\text{Mass}}{(\text{Length})^2 (\text{Time})^2}$$

The modulus of elasticity, which is sometimes used to measure the hardness of vulcanized rubber, is usually defined as the stress required to double the length of a rubber sample. It is so defined because the ratio of stress to strain is not uniform, although occasionally assumed as such for computation purposes, as with airplane shock absorbers.

The dimensions of the modulus of elasticity are—

$$\frac{\text{Mass}}{(\text{Length}) (\text{Time})^2}$$

hence it varies from the dimensions of hardness by the inverse of the dimension of length.

The value of the use of an absolute or rational measure of hardness would not necessarily involve a different instrument for testing. The figures obtained with the present instruments could be expressed in terms of any convenient units, such as pounds per cubic inch, kilograms per cubic centimeter, or dynes per cubic centimeter.

The Runge Solution Process for Rubber Reclaiming.

Special Correspondence.

THE RUNGE-WERKE AKTIENGESellschaft (Runge Works Corporation) in Spandau, which up to the beginning of 1917 was Max Fränkel and Runge, the largest German rubber reclaiming factory, has just made public some very interesting facts concerning reclaiming by the solution process.

ALKALI AND SOLUTION PROCESSES.

First, however, a few words about the German preparation of reclaimed rubbers. Among the many processes the most important at present are the so-called alkali process and the solution process. In the alkali process the fiber contents of the rubber waste are removed by being converted through the action of the alkali into a substance that is soluble in water, while the mass of rubber itself remains undissolved. In the solution process, on the contrary, the fibrous contents remain undissolved, while the mass of rubber is dissolved by the solvent employed, leaving a rubber solution from which, after reextracting the solvent, the mass of rubber is separated.

GERMAN RECLAIMED RUBBER CONSUMPTION.

The consumption of crude rubber in Germany in 1913 was over 20,000 tons. There are no statistics for the consumption of reclaimed rubbers; it was relatively small and may be estimated at something like 6,000 tons. A slight proportion of this German consumption of reclaimed rubber was made up of the rubber waste which was reclaimed in the rubber factories themselves and then made into rubber goods.

By far the greater part of the reclaimed rubber worked up in Germany in the peace period that preceded the war was imported from foreign countries, especially the United States and England. The chief reason for the slight consumption of reclaimed rubber in Germany before the war was that even in professional circles reclaimed rubbers were not looked upon as real rubber material, but only as substitutes which must be used only with the greatest possible secrecy.

RECLAIMING INDUSTRY STIMULATED BY THE WAR.

Conditions during the war gave for reclaimed rubbers a wholly

different value, for after the blockade instituted by the English the war management very soon was compelled to make use of reclaimed rubbers to an extent which every person in the business would previously have thought impossible, and which was also not affected by the production of synthetic rubbers. What was impossible in peace times was learned from the war, namely, the extraordinary adaptability of reclaimed rubber to many purposes.

The German industries that worked in rubber learned that they must give full weight to the facts that reclaimed rubbers are already a mixture of rubber and additional materials, that they contain the rubber in a vulcanized form, and that the methods of treating them in manufacturing must be different from those employed with crude rubber.

PRODUCTION OF THE RUNGE WORKS.

The reclaimed rubber production of the Runge works, reached before the war the record amount of 1,850,750 pounds in 1912 and then dropped to 1,090,432 pounds in 1914.

In the ensuing war years the output developed as follows:

	Pounds.
1915	1,433,275
1916	1,692,552
1917	1,958,872
1918	2,142,577

In the course of the war nearly all German users of rubber became favorable to the products of the establishment, so that the total production of reclaimed rubber increased steadily in spite of the fact that in the course of the later years of the war the supplies of rubber waste became smaller and smaller and had led to rapidly increasing limitations on the general use of reclaimed rubber. In 1918 the reclaimed rubber production of the Runge works amounted to over two million pounds and the returns on account of the rise in prices were roughly \$1,666,000. The firm, too, was greatly hampered at times in its production by prohibitions against the use of certain materials, for instance, by the Imperial Navy Office with regard to the solution reclaimed rubber for ocean cables, and so on. Nevertheless in the future course

of the war the Navy Department not only became the greatest user of solution reclaimed rubbers, but admitted their advantages without reservation.

NEW USES FOR SOLUTION RECLAIM.

This so-called solution process, a novel process for the utilization of rubber waste, the Runge works was the first to bring into use, not merely in Germany, but in the world. The process yields by-products which in turn make it possible to employ new methods of working in the manufacture of rubber products. The Runge firm had, even before the war broke out, obtained the patent rights for a series of processes which offer not merely the possibility but the probability of introducing revolutionary innovations in branches of industry which are remote from the rubber industry, and which before the war were not taken into consideration at all as users of rubber. The scarcity of rubber brought on by the war made it impossible to develop the possible applications of these productions of the firm. But in the coming days of peace the overproduction of the rubber plantations leads to the expectation of ample provision for the German rubber market, whether in the form of crude rubber or of rubber waste, while other industries will have to contend with a continuous marked deficiency in the raw material that must be imported from foreign lands.

The prospects for the solution reclaimed rubbers making good are much more favorable than they were before the war. The matter is one which affects especially the processes for the production of proofed fabrics, also linoleum-like flooring and other necessities for the building trade. The textile and linoleum industries are precisely the branches of industry which in the approaching days of peace for Germany will have to suffer greatly from the lack of raw materials.

THE FUTURE OF RECLAIMED RUBBER.

In the opinion of the Runge works, Germany's consumption of reclaimed rubber in the coming peace time will be uncommonly great. If German economic experience with the employment of reclaimed rubber, acquired during the war, is fully utilized, the production of a given quantity of rubber goods will require only half as much raw rubber as in the peace period preceding the war, and the other half of the rubber will be supplied by reclaimed rubbers, while the excellence of the product need not be in any way inferior to that of the earlier peace goods.

A natural prerequisite is that not only must rubber waste not be exported, but it must also be imported. If for example, in the preceding peace time the largest German rubber goods factory exported to England 8,800,000 pounds weight of worn out automobile covers and received back in return 4,400,000 pounds of reclaimed rubber, such a procedure will hardly conform to the economic requirements of Germany.

It is the belief at the Runge works that in the future German economic life and the rubber reclaiming industry will have a marked development.

SOLUTION RECLAIMING PROCESSES.

There are many reclaiming solution processes, several being of other than German origin.

HEYL-DIA PROCESS (BRITISH). By this process ground rubber is heated under moderate pressure in naphtha at a temperature of not more than 120 degrees F. The naphtha is drawn off and with it most of the sulphur. The rubber is then heated to over 350 degrees F. with a fresh solvent, when it dissolves. The solvent is then removed and the sulphur washed and dried.

THE BASLE PROCESS (SWISS). This covers the use of various ethers boiling at a temperature of about 100 degrees C.

ZÜHL PROCESS (GERMAN). Vulcanized waste is dissolved in five times its weight of naphthalene at a low temperature. The naphthalene is then distilled from the mixture with steam.

KOENER'S PROCESS (GERMAN). Waste rubber is heated with

solvents such as benzene for a time, after which the solution is further heated with water and the solvent subsequently distilled off.

DEBAUGE PROCESS (FRENCH). Tires are soaked for two or three days in xylol or other solvent, when the fabric can easily be stripped away from the rubber. The rubber attached to the fabric layers can be removed by a revolving wire brush, or by digestion in vacuum with boiling xylol. The rubber is ground while in the brittle, swollen condition produced by the solvent, and the latter recovered from the rubber and fabric by steam or dry distillation, in the latter case under reduced pressure. The solvent may also be removed by washing with acetone or alcohol.

O'NEILL PROCESS (AMERICAN). The caoutchouc is dissolved out from vulcanized waste rubber by treating the waste in a closed receptacle under about 60 pounds' pressure at a temperature below that determined to the rubber product (266 degrees F.) in the presence of boiling resin spirit. The solvent is removed from the dissolved and devulcanized rubber by vaporation. The product is said to have all the characteristics of the original rubber compound before vulcanization.

DE VILLERS PROCESS (FRENCH). Rubber-coated waste fabric is treated with boiling hot tetrachloride of ethane in two stages. The free sulphur is removed by a brief treatment and the solution of the rubber is accomplished by a second extraction with fresh solvent. After removing the fabric, the rubber is recovered from the solution by adding water and distilling off the solvent with water; or the solvent may be distilled dry, provided care be taken not to overheat the rubber.

COMPAGNIE GÉNÉRALE DES CAOUTCHOUCS DE TEREBENTHINE PROCESS (FRENCH, CANADIAN AND SWISS PATENTS). Rubber is recovered from rubbered fabrics by treatment with ethane tetrachloride, heating the fabrics during this treatment, filtering the resulting mass to remove the fabric, adding water to the filtrate and heating it to drive off the water and solvent.

GOLDMAN PROCESS (AMERICAN). Rubber stock is recovered from vulcanized rubber by bringing the latter in contact with a solution comprising resin and a material obtained by the action of dissolved resin on vulcanized rubber, and incorporating this solution with the comminuted vulcanized rubber and removing the solvent therefrom.

Cox PROCESS (AMERICAN). Rubber stock is recovered from vulcanized rubber by treatment in a resin solution together with a solution of vulcanized gum in a resin solution.

PORZEL PROCESS (AMERICAN). Rubber waste is finely ground and mixed with a rubber solution in the proportion of 2½ to 3 pounds of new rubber to each hundred of old, the solvent being gasoline or carbon tetrachloride. The mass is reground, after which the solvent and any contained moisture are removed as far as possible, the temperature being kept below the vulcanizing point, employing a partial vacuum if necessary. Molding and vulcanization are affected with or without the addition of sulphur, which, when employed, is preferably dissolved in the rubber solvent.

HARRIS PROCESS (GERMAN). Ground rubber scrap is heated with a solvent such as chloroform, carbon tetrachloride, benzol, etc., the inorganic matter is separated and the solution is treated with hydrochloric acid, rubber hydrochloride is formed and is either filtered off directly or is precipitated with alcohol or chloroform in a vacuum. After washing with alcohol, ether, or chloroform the rubber hydrohalogenide is heated with pyridin under a reflux condenser for 12 to 50 hours and the dark solution is poured into water and the regenerated rubber separates. (German patents No. 267,277, November 28, 1912; No. 267,993, December 29, 1912; and No. 267,994, January 21, 1914.)

HUTZ PROCESS (GERMAN). This consists in reclaiming vulcanized rubber scrap by treating it with hydrochlorines or the intermediate products obtained by the action of muriatic acid on glycerine. (German patent No. 268,843, December 24, 1912.)

Giant Cord Tires for Motor Trucks.

IN MANY RESPECTS the introduction of the motor truck has been not unlike that of the steam locomotive, some 90 years ago.

When the locomotive was ushered into a wondering and incredulous world its sponsors entertained fanciful visions of its future importance while the "iron horse" was still little more than a giant toy. Road conditions prohibited its use. Then followed a period during which the steel track was perfected. First, the rails were of hardwood strips, then ribbons of iron were replaced on these wooden rails, next all-iron rails were substituted, and eventually the heavy steel rail of to-day.

The adaptation of the motor truck to present-day traffic uses has been accomplished by conquering just such trying conditions as those which confronted the locomotive promoters of nearly a century ago. Gasoline makes the giant truck go, but without a suitable "track"; namely, suitable tires, its commercial or industrial advantages remain quite limited.

The first motor trucks were fitted with solid rubber tires since at that time no other tires were available. But they were far from satisfactory for every purpose. Overloading was the common cause of failure, while their inability to negotiate bad roads set decided limits to their utility.

Interested manufacturers began at once to develop tires that would permit the motor truck to branch out into broader fields of service. The advantages of pneumatic had long been demonstrated on the passenger car and the plausibility of this equipment for the commercial truck was the first thing to be investigated.

SPECTACULAR INTRODUCTION OF PNEUMATICS.

In the early spring of 1917, just before the entrance of the United States into the war, a motor truck service was inaugurated over the 1400-mile, round-trip route between Boston and Akron on a regular schedule with pneumatic equipment, the object being to secure data for defining the distinctive fields of solid and pneumatic trucking in view of all conditions.

It thus occurred that the inhabitants along the Lincoln Highway through Pennsylvania looked up in surprise one day to see a large five-ton truck rolling along at touring-car speed, on eight and ten-inch pneumatic tires, actually beating the one-way express schedule, yet with such smoothness of motion that a spare operator could sleep as comfortably aboard as in an ordinary Pullman berth, if not more so. After several trips back and forth, three more long-distance trucks joined the pioneer to form an express fleet, running on regular schedule from Ohio to New England points, and people began to wonder whether this might portend a new era in modern freight transportation.

The experiment was fairly providential in relation to the war,

when railroads were badly overburdened and when the motor truck had been called upon to save the nation from the peril of totally inadequate transportation facilities and to perform many feats to which they were wholly unaccustomed. Equipped with solid tires they had been pressed into service for hauling loads over long distances between cities, and even from the Middle West to the Atlantic seaboard.

Two important facts had been revealed to the Government through these experiences. First, that motor trucks on solid tires were largely limited in usefulness to hard surfaced roads, since these tires would slip and spin, or stall, in mud and ice and snow. Second, it was clear that the pounding of the solid-tired truck was damaging to every kind of road.

A prime end of the Akron-Boston experiment was to demonstrate to the United States Government that the giant

pneumatic tire offered the opportunity for motor trucks to become vastly more useful than they ever could be on solid tires. It was shown over a period of two years on every type of road and through the snowy passes of the Alleghenies that pneumatic tires not only enabled trucks to negotiate snow and mud where solid-tired government trucks had stalled, but also that the pneumatic equipment meant a marked saving to the roads themselves. How well, has been attested by the rapidity with which the pneumatic tire was adopted by the government truck service and also by the public following upon that epoch-making trial. Thousands of private truckers hastened

to adopt the new equipment, the economy and efficiency of which is confirmed by the continuous operation of the Akron-Boston service to the present day, two big trucks still handling rush shipments from Boston to Akron long after the railroad wartime shipping crisis has passed.

ADVANTAGES OF PNEUMATIC TRUCK TIRE EQUIPMENT.

Pneumatic tires on motor trucks save the load, the truck and the road, permit better time and therefore increase the amount of load that can be hauled in a given time. They have thus been a great aid in promoting universal use of the motor truck.

The country has been discussing the subject of the effect of heavy trucks on interurban pavements. Pneumatic tires on trucks work no harm to the roads, for they are built to distribute the load properly on the road surface. It is not primarily the weight of a truck that harms the road, but the bumping and pounding of the truck. With pneumatics this is eliminated, for the tire tread accommodates itself to the road surface and has no more harmful effect than a passenger automobile tire has.

(The Goodyear Tire & Rubber Co.)

A NEW ERA FOR PNEUMATIC CORD TRUCK TIRES.

DEVELOPMENT OF THE PNEUMATIC TRUCK TIRE.

While the establishment of the pioneer Akron to Boston express perhaps marks the turning point in the general adoption of pneumatic equipment on motor trucks, it was by no means new in 1917. In fact, the year 1908, nearly ten years earlier, marks the first efforts to develop a pneumatic tire suitable for truck service. The first tire produced was a 38 by 6 size of fabric construction. In 1908, 1909 and 1910, quite a few of these tires were applied to fire apparatus where the need for pneumatic cushion seemed most necessary. These early tires were quite satisfactory on fire trucks where the runs were short and the service was not continuous.

Starting with the six-inch tire in 1908, tires of seven, eight, nine, ten and twelve-inch sections were developed within the next few years. All of these tires were of fabric construction. As in the case of the early six-inch fire-truck tires these other sizes did fairly well in the fabric construction for short hauls and intermittent service. But when they were used for long hauls and under severe conditions, it was found that the intense heat generated caused the tires of fabric construction to disintegrate too quickly.

LARGE CORD CONSTRUCTION.

Now came an improvement of scarcely less significance than the adoption itself of the pneumatic tire. The principle of cord construction developed steadily through the years and was made practical for the more powerful gasoline passenger cars. The progress made in this direction pointed to the possible solution of the problem of pneumatic tires for trucks.

Finally the development of the cord tire was merged with the pneumatic truck tire in 1916 and the cord pneumatic truck tire was produced. This tire stripped away the limitations of the fabric type and made possible the use of pneumatics in the most severe service possible, as proved in the 1500-mile round trip between Akron and Boston.

Since the introduction of the pneumatic cord truck tire in 1916, and its thorough demonstration in 1917, the use of pneumatics has expanded rapidly. All tire manufacturers have adopted as standard the final sizes developed in 1914, including the 36 by 6, 38 by 7, 40 by 8, 42 by 9, and 44 by 10.

Thus, through some eleven years of development work, there has been provided for the truck industry and the public an improvement which bids fair to revolutionize motor truck transportation throughout the world. The cord tire has demonstrated that its great cushion and traction will enable the motor truck to do things heretofore impossible on solid tires. It is opening up new fields of usefulness for the motor truck and well informed men now look for a more rapid development in the truck industry than we have had in passenger cars, now that trucks can enjoy the same tire advantages that passenger automobiles have had.

PEACE PROBLEMS AND PROGRESS. THRIFT CLUBS IN RUBBER FACTORIES.

America has made tremendous strides in thrift during the four years in a continuance and increase in the practice of consistent savings is what the country needs above all else to bridge the present crisis, pay the nation's debts, and bring high prices down. Reckless spending by the individual is the greatest danger confronting the United States to-day. Hard work, common sense economy, wise buying and systematic saving on the part of everybody are required to avert national disaster and convert our war liabilities into peace assets.

To this end the Treasury Department is engaged in a great campaign to spread the gospel of saving and safe investment through the increased sale of Thrift and War Savings Stamps and Treasury Savings Certificates. It is asking employers of labor everywhere to encourage the organization of War Savings Societies and will also cooperate with manufacturers' repre-

sentatives in forming organizations for accident prevention to be known as Accident Thrift Clubs, the two purposes often being served by a single organization. Organizers are being sent into factories to help select officers, provide program material, furnish the initial stimulus and arrange systematic savings schemes for employees according to their incomes. This salutary movement is making headway in many rubber factories, and firms wishing to institute it among their own operatives should communicate with the Savings Division, War Loan Organization, United States Treasury Department, Washington, District of Columbia.

A NATIONAL THRIFT WEEK.

The Savings Division of the United States Treasury Department has announced plans for a National Thrift Week beginning January 17, 1920. The purpose of the week will be the endeavor to start the country off in the New Year with a sound financial program for every individual and household. Two ends are sought; first, that the condition of the individual be improved, and second, that the financial and industrial strength of the nation be increased by the great sums of capital which will accrue through the practice of steady saving and safe investment on the part of citizens. The program for National Thrift Week, as at present tentatively planned, is as follows:

National Thrift Day, Saturday, January 17, 1920.—To enlist the Nation in a campaign to "Save first and spend afterwards," making the present insure the future by regular saving to finance future opportunities or needs, and investments, preferably in loss-proof government securities.

Thrift Sunday, Sunday, January 18.—Sermons in all American pulpits on the relation of economic life to religious well-being, and the need of sharing with others.

National Life Insurance Day, Monday, January 19.—To emphasize the importance of protecting one's family with life insurance.

Own-Your-Own-Home Day, Tuesday, January 20.—To show why desirable and how possible to own a home.

Make-a-Will Day, Wednesday, January 21.—To urge men to make wills, and in so doing impress upon them the necessity of making provision for the future.

Thrift-in-Industry Day, Thursday, January 22.—To emphasize the need for factory thrift, and the economic value of cooperation between capital and labor.

Family Budget Day, Friday, January 23.—To show the importance of using the budget plan in family finance.

Pay-Your-Bills Day, Saturday, January 24.—To emphasize the moral obligation to pay debts.

Manufacturers of rubber goods and employers of labor in all allied lines can benefit themselves as well as the whole country and their operatives by cooperation in inculcating these principles in thrift, and by the sale of Savings Stamps and Treasury Savings Certificates through their offices. Investigation would probably show a large number of persons who would gladly take a definite percentage of their weekly salaries or wages in these interest-bearing Government securities.

CENSUS FOR MANUFACTURERS.

The schedules to be used in tabulating information for the approaching Fourteenth Decennial Census of the industrial resources of the United States will be mailed to every manufacturing establishment in the country during the month of December so that factory owners and managers can familiarize themselves in advance with the questions to be answered when the records of business for the calendar year 1919 have been compiled.

In addition to the general schedule a supplemental schedule will be sent to the 68 principal industries as classified by the Census Bureau. This supplemental schedule will allow detailed statistics of output to be set forth under the heading "products manufactured." All information gathered is strictly confidential and is to be used for general statistical purposes only.

Rubber Factory Foremanship.

By James Wright Cary.

A FOREMAN is one whose acquaintance with a business, competence in directing workmen and handling detail, warrants a superintendent in placing him in charge of a department. Where the "line control" method was followed he had a wide range of responsibilities, such as hiring and discharging workmen, o-k-ing time tickets, placing orders in process, obtaining supplies for his department, controlling wage rates paid to the men under him, and repairing machinery. In the circumstances it was perhaps natural that he should believe he knew his job better than anyone else, and he probably did. He was jealous of his authority, prerogatives and so-called "rights"; was intolerant of outside suggestion, a foe to changes and improvements unless recommended by himself; paternal and dictatorial toward his men; knew, or thought he knew how each phase of the work should be done; intended to be, and was consulted constantly as a matter of necessity, there being no one else; and at the same time was strangely unconscious of a well-developed "blind spot," one indication of which was his persistent refusal to train an "understudy."

Later, when meetings between the superintendent and the foremen became a regular feature of the organization, he sat in with considerable reluctance, and discussed the subjects under consideration, or offered suggestions for improvements in his own department just in proportion as he possessed an open mind, or was conscious of the necessity for, or ambitious to see improvements.

This type of foreman has held his own well down to the present, and belongs to what may be called the "old school." To him, the new ideas that began, little by little, to filter through the cracks in old line organization were things genuinely disturbing. He thought the old way was a good way, and in many respects it was. He knew that the management had depended upon him in a hundred ways, and had trusted his judgment and fidelity, his acumen, foresight and force. He had worked up from the bench, probably in surroundings inconvenient and unsanitary as compared with present-day equipment; had seen his department expand from a few men to a hundred or more, and new machinery take the place of old. He knew the whole story, and his fiber was interwoven in every line, and his personality impressed on the product from his department. He was genuinely attached to the shop, and in particular to his department, and was regarded as a successful foreman.

When the shop was small he was pretty generally informed as to the whole lay-out, but as the business grew he was more and more confined by his duties, and his time and energies were absorbed by them. The natural consequence was that the detail of other departments escaped him, and very gradually but surely he became detached from them. He was a capable mill-room or other foreman, but he knew little about spewing machines, tire building machines, presswork, shoe-making, or vulcanizing. He could handle men, but knew little of costs, up-keep or scientific management. He was simply a spoke in the big wheel, but as such was very competent, and in taking off my hat to him I wave him farewell, for this particular type of factory executive is passing. The forward-looking factory management will demand and secure foremen of a different type, better equipped. Like the old, they will be dependable, forceful, systematic. Like a trained chemist they must be able to analyze many things. The new system will require them to be specialists in more than one direction.

An expert shoemaker under present practice may be selected for inspector, and then it is but a step to the position of foreman. Or a cost clerk, as a reward for success, may be placed over the tire makers.

What to do with the old foreman? It will depend on what the laboratory terms his "elastic limit." In other words, can he absorb new ideas and develop accordingly? Can he match the new pace and keep up with it? The new method proposes to give him every opportunity and encouragement to do so. The chief difficulty will be found probably in his attitude of mind. If he is ossified in the belief that his is the one best way; if at heart he is opposed to changes; if he balks and uses his influence to create and maintain hostility among employees, then he will have to make room for the man who can meet the new proposals with an open mind and the paramount desire to be of the greatest possible benefit in the organization.

The new method begins with the scientific selection of men. Not that the old way was a failure, but the new way will require more from a foreman at the start and secure corresponding results from him afterward. He must have all the good points demanded under the old régime, plus a lot more.

Is there such a thing as scientific selection of the man? Undoubtedly. You do not pick a plow horse for a racer, nor does the crow displace the carrier pigeon for carrying messages from the battlefield. Consequently there must be a type of man who possesses inherent qualities capable of development along lines that will make him a factory executive, beginning with foremanship. In the search for this exceptional man, however, the very first thing to be assured of is the physical basis. This is a feature of profound significance. Suppose you find a man who qualifies intellectually, and you school him and coach him and spend a lot of good money to equip him for the exacting duties of the position ahead, and just at the time he is ready to qualify he goes to smash with a bad lung; or, in the midst of a strenuous campaign where he is called upon for every ounce of his personal equipment, he becomes a nervous wreck.

Is, therefore, the possession of a fortunate combination of brain and brawn essential to successful foremanship? Absolutely. Having picked your man physically, the point next in order for investigation is intellect. Intimately associated therewith is a man's schooling. He may have been a star quarterback, or able to bat a ball to the bleachers, but if he "fell down" in his studies while in school, you do not want him. There will, of course, be exceptions, but as a rule the man who showed no aptitude nor ambition in securing the rudiments of an education, will, as a sequence, not have received that mental development essential to enable him to "carry on" in the particular field under discussion. The better the mental equipment, the better are the chances for successful foremanship.

Having picked a man with brain and brawn, the third essential is temperament. Given a man with physique and mental equipment, it does not follow that, tossed in a blanket, he will land on his feet. He may be temperamentally unfitted for foremanship. He may lack that vital essential, control of men. He may have no "head" for detail, and a lot of other things.

It is but fair at this point to give the psychologist an opportunity to "show him up." Some doubt his value. Many a superintendent prefers to trust to what he calls his "judgment" of men; he can "size them up." This faculty has been termed the "sixth sense," but is after all, really psychology. But psychological or not, it is certainly good sense to take into account a man's bearing, his facial angle, his voice, eyes, walk, and especially any eccentricity that may distinguish him from the ordinary run of men. These in sum make up for you a replica of the man himself, and enable you to determine whether he is worth taking a chance on. For, taking it by and large, it is more or less of a gamble whether results will justify your choice.

It facilitates matters to chart your man. Make up a list of the qualities you wish a foreman to possess. Professional psychologists follow this method. Dr. Blackford thinks an executive should possess a "keen sense of justice, courtesy, dependableness (constancy, reliability, uniform disposition), courage, love, teachableness (ability to learn even from the lowest worker), openness of mind, tactfulness, sympathy (ability to appreciate the other man's position), understanding of human nature." William Kent would have him possess, "education and special knowledge, industry, aggressiveness, health, energy, initiative, tact, personality." Frederick W. Taylor would have chosen men with "brains, honesty, education, judgment or common sense, tact, technical or special knowledge, manual dexterity or strength, energy, grit, good health."

It is singular that these "authorities" should not more closely agree as to the elements that predominate in the 100 per cent man. Here are afforded, however, suggestions sufficient to aid in the creation of a chart for guidance, whereon to note impressions of the men selected for foremen, or for any other position. Naturally you will have these charts frequently before you, "keeping tabs," correcting first impressions, probably, and finally obtaining an accurate record of each man in whom you have a special interest.

You have, let us assume, a dozen men selected from among the foremen of as many different departments, and also a dozen "green" men picked from the ranks of whom you conceive as possessing abilities worth your time and money to develop. All these men have been under observation for some time, and to them you have confided your aim. The chances are the foremen know little about the factory outside their departments, and the new men are getting their first real acquaintance with rubber goods manufacture.

With the selection of these men enters your responsibility to train them so well that within a reasonable time they will be equipped to demonstrate in a practical way the value of the method you have employed. There are, doubtless, divergencies of opinion as to the details of such training, but the fundamentals are easily discernible. First, a basic knowledge of rubber; sources; methods used in its gathering or production in forest or plantation; its chemistry, inspection and selection. Second, manipulation and preparation for use in manufacture. This will carry the student through washing, drying, compounding, mixing, calendering, and include the preparation and use of fabrics. This knowledge must be acquired by personal contact with the work. The student should manipulate the compounds and understand why they are employed. He should work as one of a "crew" at every preparatory process, and should be coached and catechized frequently that there may be no question that he is acquiring a practical working knowledge. This he can demonstrate very readily by giving in writing the detail of each step in each process he observes. Furthermore, he should be encouraged in a critical attitude toward machinery, methods, appliances, and personnel, and to suggest betterments. This method will surely show whether a student has the critical faculty, constructive imagination, and practical ideas, all of which are essential to the equipment of the man who would qualify for foremanship. Having mastered basic details, the student should next acquire a working acquaintance with individual processes. He should learn to run a spewing machine, a jar-ring cutter, a sole cutter, a vulcanizer. He should learn how to make automobile casings, and tubes, hose, belting, shoes, and packing. In short, he should acquire a practical knowledge of how all of the goods produced by the factory in which he is employed are made.

As to the time required to complete such a course of study, it naturally depends on the man. Much could be accomplished in three months by intelligently directed, concentrated work. It is just as well to remember first, that men are being trained for executive factory positions in your factory, men to whom great

responsibility will be entrusted, not for one year, but for many years, and that you can well afford all the time necessary to gain this end; second, that there is bound to be a noticeable difference between these men in their quality, capacity, and ultimate value, and that a successful course of training must be based upon this. He would be a foolish tailor who tried to fit all men with one size of suit; he, per force, has several sizes, or he does little business. Why not have a series of study courses to which individuals will automatically adapt themselves? For example, the first lesson series would cover the study and manipulation of crude rubber, compounding ingredients and fabrics, the machinery required, and the manufacturing processes involved, supplemented by reading such works as "Crude Rubber and Compounding Ingredients," "Rubber Machinery," etc. Also lectures should be delivered before students by the master mechanic and the chief chemist. This series should be quickly disposed of, depending much on the skill with which you have picked your men. By this time you will have gained a better acquaintance with them and may have reason to believe there are some whose capacity for knowledge has reached the "saturation point."

Have prepared a second series for those who are fortunate enough to "carry on." This will include the study and practice of job analysis as applied to machinery, methods, men, and factory conditions; time study of manufacturing operations with a view to suggesting piece-work rates, which may be checked against those in force, simply for the education of the students. Incidental readings would cover such authors as Taylor, Gantt, Gilbreth, Emerson, Thompson, Knoepfel, Diemer, and others; also the current magazines devoted to manufacturing and kindred subjects. Lectures should be provided related to the general scheme, such as factory construction and equipment, chemistry of india rubber, production and use of power, machinery and tools, management of a work force, wages, etc.

A few words regarding job analysis and time study seem pertinent here. It must not be supposed that anything of a superficial nature will suffice to fit a student to make a proper job analysis, any more than holding a stop-watch on a factory operation constitutes time study. Much of the disastrous record in the past is directly chargeable to lack of proper preparation in these two lines. Job analysis requires a combination of trained observation coupled with good, practical ideas. Efficiency in making a time study cannot be acquired in a day or a week, even if intelligently directed, and it is open to question whether there is in the average factory organization any written standard practice worthy the name, giving detailed instruction of how a student should be trained for this work. It is no part of this discussion to devise a curriculum covering these subjects, but to point out that the average man has few qualifications for dealing with them. If, therefore, you are fortunate enough to bring forward all members of the school into the second series, by this time you may find some who have reached their intellectual limit, or at least do not show that capacity for assimilating knowledge that will warrant introducing them into a third series. Those who were found to have serious limitations need not necessarily be classed as failures, for each takes automatically, as one might say, his position in the scholastic gage-glass, according to his specific gravity.

There remain for further schooling the top-notchers from whom may be properly expected the highest returns. These men should give special attention to factory organization and management, interdepartmental relations, planning, routing, costs, waste, power, standardization, welfare, betterments, and so on, to the end that they may become foremen in name, but in reality, assistants to the superintendent. In sum, you will have secured men who know the manufacturing of rubber goods thoroughly, and are specialists in the lines made in your factory. They have worked with the factory rank and file to the point where they will be a credit to your organization.

LONG-STAPLE AMERICAN-EGYPTIAN COTTON.

LONG-STAPLE COTTON of the American-Egyptian type needs, as conditions for successful production, an unusually long growing season, freedom from boll weevil and an assured supply of water for irrigation. Dwight B. Heard told the Cotton Conference that met in New Orleans in October.

The production in 1918 was 38,246 bales of 500 pounds each of long-staple cotton, 34,300 of which were grown in the Salt

A FIELD OF AMERICAN-EGYPTIAN COTTON.

River valley of Arizona, 1,200 each in the Gila valley and in the California Imperial valley and smaller quantities in the Colorado valley in Arizona and the San Joaquin and Palo Verde valleys in California. Besides this, the Imperial valley produced 35,000 bales of short-staple and 5,000 bales of Durango cotton and the Yuma valley 20,000 bales. The short-staple product this year will probably be 10,000 bales larger, while the long-staple Pima crop will be over 50,000 bales.

This crop was of exceptional interest to spinners and to the manufacturers of choice cotton goods because the new Pima cotton was quite as desirable as Egyptian Sakellarides and could be spun into equally fine counts. In 1918, on an ordinary run of 2,112 bales at the gin of the Tempe Exchange, at Tempe, Arizona, under government classification and supervision, the grade and percentage of this lot of Pima cotton ran as follows:

Grades.	Per Cent.	Staples.	Per Cent.
No. 1 or fancy.....	14	1½ to 1¼.....	61
No. 2 or extra.....	52		
No. 3 or choice.....	17	1¼ to 1-M.....	37
No. 4 or Standard.....	9	1½ to 1½.....	32
No. 5 or medium.....	7		

In 1919 the percentage of cotton running 1-11/16 and 1¼ was larger than in 1918. The remarkable success in the Salt River valley, where 95 per cent of the Pima cotton produced in America will be grown this season, is largely due to the scientific care with which this industry has been developed. One feature is the fact that but one type of American-Egyptian cotton, Pima,

is grown throughout the entire district and all danger of crossing with inferior seed is avoided. Of the total area of 275,000 acres now under intensive cultivation by irrigation in this district, 88,000 acres, or 32 per cent. of the entire acreage, is planted in Pima; a percentage which can be readily maintained.

The growers realize that the immunity of the Salt River valley from the boll weevil and other pests which have handicapped the cotton industry in other sections must be maintained, and with the cooperation of the Government the best methods not only to prevent the importation of seed in which there could be any danger of infection, but to maintain the highest standard in the selection of the local seed, have been practiced. The cotton plant is essentially a sunshine plant, and there is probably no section of the world except Egypt where the sun shines with more regularity than in the Salt River valley.

This year 88,000 acres in the Salt River valley alone are planted. The land has been more carefully selected than before and it is not unreasonable to assume that from 45,000 to 50,000 bales of Pima cotton will be produced. In the Florence and Casa Grande valleys, including the Sacaton Indian Agency, southwest of Phoenix, this year's production will probably equal 2,500 bales, while in the Yuma and Parker valleys, along the Colorado River, and in certain sections of the San Joaquin valley in California 1,500 to 2,000 additional bales of Pima cotton can be expected, making a total production for this season of from 50,000 to 55,000 bales. In the Salt River valley there should be for sale this year from 20,000 to 25,000 bales of unmortgaged cotton.

It is significant that last season the total production of Pima cotton equaled the production of Sea Island cotton. The total manufacture in the United States of long-staple cotton, either Old-World Egyptian or Sea Island cotton in the five years previous to our entry into the war, was 275,340 bales annually, of which 78,650 400-pound bales was Sea Island.

With the increase this year of the production of Pima American-Egyptian cotton to approximately 50,000 bales, while there are only 15,000 bales of Sea Island cotton, it is manifest that the Pima cotton has become a very material factor in the long-staple market.

MEADE COTTON A SUBSTITUTE FOR SEA ISLAND.

Disheartened, and hopeless of the recovery of Sea Island cotton from the continued invasion of the boll weevil, the United States Department of Agriculture recommends the substitution of Meade cotton, developed by the Bureau of Plant Industry.

Meade cotton is a new upland long-staple variety, which is the nearest approach so far to Sea Island cotton in length and fineness of fiber and is recommended particularly to planters in the West Indian islands. It is named after the investigator of the Bureau of Plant Industry who was improving the variety when he died. It now produces lint averaging 1½ inches in length with unusually uniform fibers. The seeds are large and yield a high percentage of oil, about 24 per cent. They are slightly tufted at the ends like the seeds of Sea Island and Egyptian cotton, so that it is possible to use for this cotton the roller gins employed for Sea Island cotton.

In 1917 Meade cotton was picked two weeks ahead of Sea Island. It yielded twice as much, 230 pounds compared with 117 pounds, and it was easier to pick because the bolls are twice as large as Sea Island bolls. The lint ranges between 1¼ and 1½ inches, has good luster, a slightly heavier body than Sea Island and is scarcely distinguishable from it when properly ginned. It should be treated in the same manner and as carefully as Sea Island.

VENEZUELA'S CHIEF IMPORTS, AMONG WHICH WERE RUBBER articles and duck, were transported mainly by parcel post during the years 1917 and 1918.

Interesting Letters from Our Readers.

ANALYSIS OF THE COVERINGS OF A ZEPPELIN.

TO THE EDITOR:

DEAR SIR: The external covering (of a Zeppelin) was made of a tissue that was colored grayish blue at the top and black at the bottom. The gray blue was obtained by printing with indanthrene blue by means of a roller engraved with very fine lines as though for a border of calico. The tissue covered with its varnishes weighed 146 grams a square meter.

Treated with hot tetrachlorethene it loses its varnish of cellulose acetate which dissolves; with the varnish gone the tissue preserves its coloring, therefore it was printed before varnishing. The composition of the tissue per square meter was:

	Grams.
Printed cloth	113.8
Cellulose acetate	32.6

The prime material of the tissue was cotton in very fine threads. The lower portion was wholly black. It weighed 127.60 grams per square meter. Treated with solvents it yielded (1) Cellulose acetate, (2) Japanese black varnish.

After the black varnish was removed it showed a blue-gray coloring like that of the tissue of the upper portion. The black varnishing seems to have been put on after the balloon had been constructed, in order to make it less visible. The composition of the tissue, per square meter was:

	Grams.
Printed tissue	86.80
Cellulose acetate	31.9
Black varnish	7.

The tissues contained no trace of rubber varnish. The covering of the interior small balloons intended to hold the hydrogen was made of a thin silk tissue, covered with a varnish formed of:

(1) Factice of chloride of sulphur that could be extracted with alcoholic potash. (2) A fat varnish of linseed oil. (3) A varnish with a base of coumarone or of bakelite soluble in alcohol.

On this tissue were glued by means of a varnish of cellulose acetate two layers of gold-beater's skin. These gold-beater's skins were covered with a supple layer of cellulose acetate with a base of furfural. The composition of the tissue was as follows:

	Grams.
Weight of whole tissue per sq. meter	180.
Weight of varnished tissue	103.
Weight of varnished gold-beater's skin	77.
Weight of silk tissue	84.1
Various varnishes of tissue	18.9
Pure gold-beater's skin	65.1
Varnish of gold-beater's skin	11.9
Total weight of varnishes	30.

This wrapper bore no trace of rubber.

ANDRÉ DUBOSC.

Paris, France, November 20, 1917.

PHILIPPINE GUTTA AND THE BRITISH.

TO THE EDITOR:

DEAR SIR:—I understand from the newspapers that the gutta percha in the Philippine Islands is owned by the British. That we Americans are practically frozen out and cannot cover our own cables without English consent. Is not this another case of unwarranted British aggression?

JOHN MCCORMICK.

San Francisco, California.

(The newspapers are wrong. Philippine gutta belongs to the Filipinos, is gathered and marketed by them. The middlemen are Chinese who ship it to Singapore, grade and sell it. If you desire to lay a cable you can buy gutta in the Philippines if the Chinese do not get it first. If you do not plan cable construction but are simply working up a racial grudge better thrash a Chinaman. Don't hit an Englishman; first, because he is not at fault and second, because he is liable to hit back.—The Editor.)

A BIT OF CHARLES GOODYEAR HISTORY.

TO THE EDITOR:

DEAR SIR:—I wonder if you know that a man lives at the Congress Hotel in Chicago who was at one time quite intimately connected with Charles Goodyear? He is Mr. I. S. Deutsch, whose father bought the Goodyear estate at Burrville, Connecticut.

As a boy, Mr. Deutsch ran across a great variety of experimental curios left by Charles Goodyear. Later, Mr. Deutsch married one of the daughters of the late J. M. Brunswick, the pioneer of the Brunswick-Balke-Collender Co., and here again he was brought into contact with india rubber. For example, Mr. Bensinger, another son-in-law of Mr. Brunswick, was closely associated with Dr. B. F. Goodrich, and it is said that it was he who exerted strong influence in inducing Dr. Goodrich to go to Akron. As Mr. Deutsch remembers it, Dr. Goodrich's intention at first was to confine his factory output to hard rubber. He, however, later went into mechanical rubber goods and a general line, some of which were made on patents owned by Dr. Goodrich and Mr. Bensinger.

Strange to relate, Mr. Bensinger was one of the first to suggest the amalgamation of canvas with rubber to get additional resiliency and durability, essentially the same construction as is now used for the manufacture of tires.

W. C. JENKINS.

Chicago, Illinois.

(Bits of history of this sort are exceedingly interesting as they give valuable sidelights on matters that are oftentimes either forgotten or misunderstood. It is the writer's impression, however, that the hard rubber business which Dr. Goodrich took up came about long after druggists' sundries and mechanical goods had been installed and successfully manufactured. It may be true that Mr. Bensinger first suggested the amalgamation of canvas with rubber in Akron, but such use had been made in other manufactories for thirty or forty years, and indeed, dates back to 1820, to be exact, when it was used in England. In fact, it antedates the discovery of vulcanization. This statement of course is not made to minimize in any way the work that either Mr. Bensinger or Dr. Goodrich did, as the great company that was built up through the pioneer efforts of these men speaks for itself.—The Editor.)

RUBBER IN SLICKERS.

TO THE EDITOR:

DEAR SIR:—In the so-called slicker as made to-day, is rubber used? Also, was it used in the old-time slicker of forty years ago?

JOHN E. REYNOLDS.

Rockport, Massachusetts.

(The slicker as made to-day contains no rubber. It depends upon specially prepared oil for its waterproof qualities.

Years ago, however, rubber was used in making the old fashioned Cape Ann slickers. One of the prominent manufacturers forty years ago was Levi Nicholson of Swampscott. They were also made far down on Cape Cod and by Cummings & Howes at Orleans. They went out of business 35 years ago. The recipe used was:

- 1 gallon linseed oil.
- 1 gill Pratt's zinc dryer.
- 1½ ounces red Para rubber.
- Lampblack dissolved in turpentine to color.

One successful manufacturer treated the oiled surface with a sour milk wash with good results, an acid cure through the use of lactic acid.—The Editor.)

What the Rubber Chemists Are Doing.

By P. Schidrowitz and H. A. Goldsborough.

STUDIES IN VULCANIZATION. THE RUBBER STRESS-STRAIN CURVE.

THE AUTHORS have published the first of a series of papers* in which they purpose to carry out their deferred plan to discuss their studies in vulcanization. The leading features of their paper on the rubber stress-strain curve and determination of "correct cure" are given below, necessarily somewhat condensed.

NATURE OF STRESS-STRAIN CURVE.

E. Hatschek and H. A. Goldsborough examined the practicality of obtaining a single expression for the stress-strain curves of a series of cures of the same mixing. (The mixing employed in the fundamental experiments consisted of 100 parts of rubber to eight of sulphur, cured for periods varying from 15 to 405 minutes at 286 degrees F. in molds in live steam).

As bearing on the mathematical nature of "type," it is desirable to restate, briefly, the following characteristics of progressive cures of the same rubber-sulphur mixing, as first set forth by Schidrowitz:

1. The process of vulcanization is physically and mechanically of a definitely progressive character, and its progress can be accurately and graphically represented by a series of stress-strain curves.

2. The state of cure of a given mixing of any rubber at any given time (assuming standard conditions) is graphically expressed by the form and position of the corresponding stress-strain curves representing progressive cures which bear a certain mathematical relationship to each other for any one rubber, and a relationship exists between the series of curves representing progressive cures of any one rubber and the series of cures representing progressive cures of any other rubber.

3. As curing proceeds the curves come farther down the paper in regular fashion and do not intersect at any point.

4. At a part of the curve not far from the point of inflection the curves become parallel to each other. That is to say, the rate of stretch decreases with increasing loads, and is independent of the state of cure. The above characteristics for a single set of cures may be readily gathered from Figure 1.

Examination of the curves showed that they belong to the conchoid family, and it was found that a conchoid corresponding closely to the rubber curve could be expressed, referred to Cartesian coordinates as follows:

$$y = a - \frac{b \sin \alpha}{x} \quad (a, \cot \alpha = b \cos \alpha, \alpha)$$

The rubber curve is derived from the parent conchoid by plotting the ordinates against a constant fraction (n) of the corresponding abscissa, as expressed in the above equations.

The interpretation of the terms in the above expressions may be obtained from the following considerations:

(1.) a represents the distance between the pole of the curve and the asymptote.

(2.) n is a constant in the expression $x - (nx')$ in which x is the load at any point on the stress-strain curve and x' is a corresponding point on the parent conchoid.

(3.) an is a constant for any given set of curves.

(4.) n represents the increase of stretch per increment of load, or in other words slope or "type."

(5.) Hence a/n or $1/n$ is the degree of stretch or distensibility.

(6.) It follows that a represents a quality which is the inverse of stretch capacity, namely, toughness or tenacity.

(7.) b represents the limits of extension.

In every set of curves (progressive cures of the same mixing) there must be a specific curve in which $a = b$. It follows that this specific curve represents a theoretically ideal balance of properties. The curve in question is the one we term the correct or perfect cure.

It is remarkable that a/n (i. e., slope or type), which obviously represents a fundamentally important quality of a rubber, is a constant for any rubber, theoretically from the point of inflection upwards and actually, as found experimentally, from a point not far removed from the latter.

Expressed in other terms, this means that after the initial stage of stretching, equal increments of load produce equal elongations, whatever the state of cure.

FIG. 1. STRESS-STRAIN CURVES REPRESENTING SUCCESSION CURES OF ONE MIXING AT 15-MINUTE INTERVALS (E. G., V = 75 MINUTES, $a = 26$ MINUTES, ETC.) IN STEAM AT 286 DEGREES F.
PART OF A SERIES FROM 15 MINUTES TO 6½ HOURS.

It has been found by solving the correct cure curves by the method of trial and error that all correct cure curves are derived from the parent conchoid in which b (and therefore also a) = 10.5. Since the curve meets the asymptote at infinity, it follows that we are justified in concluding that all correct cures of a standard mixing consisting of 100 parts of rubber to eight parts of sulphur (whatever the nature of the rubber, provided it is Hevea) meet at a point for which the coordinates are $y = 10.5$, $x = 0$; that is, an extension of 11.5 times the original length is the limit of distensibility.

METHOD OF DETERMINING "CORRECT CURE."

From the above it will readily be inferred that to obtain the correct cure it is necessary to determine a , b and n . In other words, it is essential to determine (1) type and (2) the particular curve in any set in which $a = b$.

TYPE.

In practice the determination of a/n ("type") by means of the expressions corresponding to the coordinates is obviously inconvenient. Taking advantage of the fact that "type" represents increase of stretch per increment of load, we determine the

*"Journal of the Society of Chemical Industry," September 15, 1919, page 347T.

property by measuring the increase in elongation corresponding to two suitable points on the load coordinate as follows:

$$E_1 - E_2 = \frac{F_1 - F_2}{\text{Type (Conventional)}} \times 2.5$$

Where E = extension per cent at 600 grams per square millimeter and E_2 is that at 1040 grams.

The extensions corresponding to the loads stated for various types for the correct cure in each case were found to be as follows:

TABLE I
Types 33 to 45.
*Correct cure (extension at 600 grams and 1,040 grams per square millimeter mixing 160 of rubber to 8 of sulphur)

Type	(E)	Extension, Per Cent.	
		600 Grams per Sq. mm.	1040 Grams per Sq. mm.
32	270	968	82
34	815	900	85
35	805	892	87
36	794	884	90
37	783	875	92
38	772	867	95
39	761	859	98
40	750	850	100
41	740	842	102
42	729	834	105
43	718	825	107
44	707	817	110
45	697	809	112

† 9.26 Times original length.
‡ 10.08 Times original length.

A glance at the above table and Figure 2 will reveal the fact which is of fundamental importance, namely, that the lower (or better) the type figure (*i. e.*, the more rapid the decrease in extension with increasing tension towards the end of the curve), the less rapid is the decrease in the initial portion. In other words, a curve representing a rubber A which is flatter in type than rubber B, will lie for the whole of its course above the latter at the correct cure (*i. e.*, where $a = b$). As confirmation in this connection it is interesting to note that de Vries and Hollendorff, in a paper from the Central Station at Buitenzorg (which has adopted our method of determining "type"), found that "the maximum of tensile strength is found higher on the paper the flatter (smaller) the 'slope,' that is, the better type or quality as determined by this property." These authors found a range of variation in different grades of plantation rubbers of 36 to 53.

FIG. 2. STRESS-STRAIN CURVES REPRESENTING CORRECT CURES FOR TYPES 33, 34, 38 AND 43

The same authors in a previous paper¹ found that "the permanent set for one standard state of cure shows a close relationship with the property called 'type' by Schidrowitz. . . . As the 'type' in ordinary routine testing of raw rubber can be determined

in the same operation as tensile strength, a separate test for permanent set, when using the above-named mixture of rubber and sulphur only, is superfluous for ordinary samples. Only in the case of rubber prepared by special methods a deviation from the above given relationship may occur and lead to important conclusions."

A consideration of the above will demonstrate the fallacy of measuring the quality of a rubber by the resistance to stretch method, which consists in determining the load necessary to produce a given extension at a single point, and assumes that the greater the load the better the rubber. For rubbers of different "types," the reverse is actually the case. Further, it is obvious that the application of this method for determining state of cure, as suggested², may give fallacious results.

NON-VARIATION OF TYPE.

The authors have demonstrated that the constancy of a/b or "type" is not subject to variation by experimental conditions, citing particularly variations in curing time; mixing by different operators and machines; curing in different vulcanizers; method of heating; overworking the rubber mixing and variations of "rest" or "storage" after mixing.

THE CORRECT CURE.

We have shown that the curve in any series of cures which we select as the "correct" cure possesses certain attributes which represent (theoretically) an ideal balance of properties. It is the curve in which $a-b$, that is to say, the toughness or tenacity equals the limit of extension. It is obvious that for purposes of comparative evaluation of crude rubber, a certain definite curing standard must be selected.

There is a great and undeniable advantage in a method which not only indicates quite clearly which curve represents the "correct" or standard cure, but which in addition, in the case of a curve which is not correct, indicates quite clearly what the correct cure should be.

Some examples are given below of "correct cures" obtained on the basis of a single preliminary cure. The rubbers consisted of various plantation grades (smoked sheet, pale crepe, brown crepe, and scrap). Some rubbers of an experimental type are also included.

EXAMPLES OF "CORRECT CURES," OBTAINED ON BASIS OF ONE PRELIMINARY CURE.

true metals and a vulcanizing constituent. (Bela W. Rote, assignor to L. J. Weadock, both of Elyria, Ohio. United States patent No. 1,318,804.)

METHOD OF MANUFACTURING TIRE TUBES of layers of Japanese paper pasted together, coated with alcohol solution of resin and shellac and finished with a thick solution of india rubber on both the inner and outer surfaces. (Eisutario Ikeda, Tokio, Japan. United States patent No. 1,319,003.)

PLASTIC MASS RESEMBLING SOFT RUBBER OR LEATHER AND PROCESS, consisting in treating yeast with formaldehyde and subjecting the product resulting to the combined action of heat and pressure. (Ernst Krause, Steglitz, and Hans Blücher, Leipzig-Gohlis, Germany, assignors by mesne assignments, to the Chemical Foundation, Inc., New York City. United States patent No. 1,319,666.) (See German patent No. 314,728 granted to Hans Blücher, Leipzig.)

LEATHER SUBSTITUTE AND PROCESS OF MANUFACTURE. Sheets of fibres are saturated with a solution of a binding agent, dried and compressed, coated with rubber containing a vulcanizing agent and cured under heat and pressure. (Roland B. Respass, New York. United States patent No. 1,319,795.)

COMPOSITE SHEET MATERIAL consisting of a fibrous sheet impregnated with an oxidizing oil, textile fabric superimposed on one surface thereof, and a layer of elastic adhesive material uniting the fibrous sheet and fabric. (Alexis W. Keen and Pietro Frigeri, New York City, assignors to Rubber Regenerating Co., Naugatuck, Connecticut. United States patent No. 1,320,149.)

PROCESS FOR VULCANIZING RUBBER AND PRODUCTS OBTAINED THEREBY. A process for treating rubber or similar material which comprises subjecting the rubber to an organic dye adapted to produce oxygen and inducing vulcanization to take place under the action of said oxygen. (Iwan Ostromislensky, Petrograd, Russia, assignor, by mesne assignments, to New York Belting & Packing Co., New York City. United States patent No. 1,320,166.)

THE DOMINION OF CANADA.

RUBBER VULCANIZING PROCESS which comprises mixing dinitrobenzene and red lead with rubber or similar materials and vulcanizing the mixture. The patent also includes the vulcanized products of the action of red lead and dinitrobenzene. (The Canadian Consolidated Rubber Co., Limited, Montreal, Que., Canada, assignee of Sheldon P. Thacher, Weehawken, New Jersey. U. S. A. Canadian patent No. 193,394.)

THE UNITED KINGDOM.

COATING MATERIALS FOR FABRICS, ETC. Turkish birdlime is thinned with alcohol and used for rendering porous materials impervious, especially for making petrol tanks from porous materials such as canvas or from a material such as rubber, which is attacked by petrol. The birdlime is preferably treated with hot solution of borax or with hot water, then heated to 180 degrees F. and mixed gradually with the alcohol. To vary the consistency, diatomaceous earth shellac, or dextrine may be added. (C. A. Brackenside, Woburn Sands, Bedfordshire, and Gayner Pneumatic Co., 95 Cannon Street, London, British patent No. 130,379.)

LABORATORY APPARATUS.

AN EFFICIENT CONDENSER.

The Kobe Condenser has three sets of walls. The water for cooling enters through the upper side tube, thence it passes through the coiled inner tube and out by the lower side tube.

The distillate enters the adapter at the top, passes through the expanded middle tube and out by the tube at the bottom.

While in the apparatus the distiller is cooled in three ways; first, by the expansion of the middle tube; second, by the jacket of cold water around it; and third, by the cold tube coiled inside it.

A Kobe condenser of this type, with body six inches long, is as efficient as a regular Liebig condenser 35 to 40 inches long. It is especially recommended for liquids of low boiling points. (Eimer and Amend, Third avenue, 18th to 19th streets, New York City.)

THE KOBE CONDENSER.

The connection is made by means of an annular groove in the key of the stop-cock so that there is always communication between the lower flask and that of the upper one.

One arm of the stop-cock is extended until it opens above the liquid in the upper container. The liquid enters at an aperture in the lower part of this opening. Two different styles were made using the same principle in each. ("The Journal of Industrial and Engineering Chemistry.")

STOP-COCK FOR EQUALIZING PRESSURE.

IMHOFF TUBE.

IMHOFF SEDIMENTATION TUBE.

The Imhoff sedimentation tube for determining sediment in water and other liquids is shown in the accompanying illustration. It has a capacity of one liter graduated or divided as follows: up to 2 cc. in one-tenth cc.'s; from 2 to 5 cc. in one-half cc.'s and from 5 cc. to 4 cc. in single cc.'s. (Eimer & Amend, Third avenue, 18 to 19th streets, New York.)

New Machines and Appliances.

HERRINGBONE REDUCING GEAR DRIVES.

Complete drive units consisting of a pair of herringbone gears and pinions enclosed in an oil-tight case for reducing the speed of an electric motor to mills or calendars are necessary equipment in every rubber mill. The accompanying illustration of a vertical calendar drive shows the reducing gear commonly used to connect 66-inch calendars with 100 h.p. 950 r.p.m. motors.

The gears are made of furnace-annealed steel castings, the pinions, of hammered open-hearth steel forgings, are made integral with the pinion shaft, and the shafts are of open-hearth steel forgings. The low speed, or gear bearings are cast integral with the main frame and fitted with removable split shells of cast steel, babbitted. High speed, or pinion bearings consist of babbitted pillow blocks bolted to the frame. For rebabbitting or other repairs the pinion bearings may be readily taken down and the shells easily removed from the gear bearings. Genuine babbitt, or such other high-grade bearing metal as is most suitable, is used in all bearings. All bearings have oil ring lubrication, the oil being supplied by separate reservoirs below the gear and pinion shafts. Oil for lubrication of the

VERTICAL TYPE CALENDER DRIVE.

gears is kept separate from that in the bearing reservoirs by throwers and retainers on the gear and pinion shafts.

The main frames are made of iron castings of heavy section and proper dimensions to obtain rigidity. They are machined to carry the gear and pinion bearings in correct alignment, and are provided with foundation bolt holes of proper size.

Gear covers for all drives are entirely separate from the main frames, and form an oil reservoir for lubricating the gears. They are made of cast iron split horizontally in the center line of the gear and pinion shafts, and are machined and fitted together to obtain oil tightness. Covers are attached to the main frame in proper position by means of machine bolts. Oil gages, oil drains, also inspection and oil supply openings, are provided. (Fawcett Machine Co., Pittsburgh, Pennsylvania.)

HYDRAULIC BICYCLE TIRE PRESS.

The use of the formerly plebian bicycle is said to be rapidly increasing in popularity and in consequence bicycle tire makers are planning to increase materially their future production.

However that may be, the accompanying illustration of a British press-vulcanizer, with its novel features is of more than passing interest.

The press is made in two sizes for 26 and 28 inch bicycle tires. It is operated by two rams one of which closes the press and at the same time the other automatically expands the collapsible core which is made in eight segments. The loose tread ring for forming the pattern of the tire is not shown in the picture, but is fitted to the columns and is easily changed to enable the same side rings and core to be used with varying tread rings to produce any desired patterns. The time of vulcanization varies from five to seven minutes. (Francis Shaw & Co., Limited, Manchester, England.)

BICYCLE TIRE PRESS VULCANIZER.

SOLID WOODEN SHELLS.

The wooden shell formerly universally used in rubber factories was built in two pieces held together by glue and dowels reinforced at the ends with flat iron rings held in place by screws. Such shells frequently fell apart and have been practically superseded by metal shells.

Solid wooden shells turned and bored from one piece and reinforced against splitting by special cast rings sunk deeply into the ends, are made for the rubber manufacturing trade and other industries. They may be used either with wooden or metal center bars and are found very satisfactory. (Adolph Martin Sons, Inc., Passaic, New Jersey.)

WOOD CALENDER SHELL.

A NOVEL FACTORY SIGNAL.

The Klaxocator is an electrical code calling mechanism which will signal either audibly with horns, bells or whistles, or by electric lamps placed at any number of points throughout a factory. Its operation is entirely automatic after it has been set for a given code number by the operator.

While it is used chiefly for summoning officials, department heads and production foremen to the nearest telephone, it may be utilized for fire alarms, danger warnings, as an extension to telephone bells in noisy places, for signals between departments, for sounding the time of beginning and stopping work, or giving warning that power, light or water is to be cut off.

These code signals are sounded simultaneously as many points as signal stations are installed, or shown by lights, ac-

cording to the character of equipment. Horns used with the device are, similar to the well known electric auto horns and vary in shape according to whether it is desired to scatter the sound, to intensify it in a horizontal direction, or to deflect it downward. The horns are connected to an available 110 or

THE KLAXONATOR.

220-volt circuit, either direct or alternating current, while only a small current from a few dry cells is used in the central instrument.

When it is desired to call some person, the operator sets the desired person's code number on the dial and pulls a lever. The contact shaft is set in motion instantly by the spring and the circuit is closed a certain number of times in accordance with the position of the code drum. Every time the battery circuit is closed the relay closes the power circuit and operates all the horns, whistles, gongs and lamps connected to it. Having sounded the complete call three times, the number indicator returns to its original position and the mechanism is ready for the next call. Numbers may be sounded as many as three times if desired. (The Klaxon Co., 1 Madison avenue, New York City.)

ELECTRIC SPACE HEATERS.

This is a steel-jacketed heater of special design intended for heating crane cabs, out houses, valve, pump and meter houses. In rubber mills there are undoubtedly many places where this device can be used to advantage in winter weather.

Each heater has a capacity of 500 watts and may be connected to any direct or alternating current lighting or power circuit of 115, 230, or 250 volts pressure. These heaters can be mounted in groups or singly at different locations and additions may be made as easily as adding electric lamps. The heaters are flat like an ordinary ruler, the thickness being 3/16-inch, the width 1 1/2 inches, and the length 24 inches. (The Cutler-Hammer Manufacturing Co., Milwaukee, Wisconsin.)

CIRCULAR MANDRELS FOR CURING INNER TUBES.

The principal advantages claimed for inner tubes that are cured on circular mandrels are that they conform to the shape in which they are used in the casings, meaning a more uniform

thickness in the volume of rubber used and resulting in a tube of much better lasting quality.

The illustration shows a popular type of a circular tube-curing mandrel before the tube is applied, and the spring-controlled section explains how the mandrel is made practically endless.

These mandrels are made in all sizes, from 3 to 12 inches in section, the 6-inch size and larger being particularly advantageous, due to their comparative lightness. (The Republic Tool & Manufacturing Co., Circular Tube-Curing Mandrels, Cleveland, Ohio.)

MACHINERY PATENTS.

MACHINE FOR APPLYING RUBBER CEMENT.

THIS MACHINE applies cement in a semi-automatic manner to rubber clothing, gas masks and other articles made of rubber.

A front elevation of the machine, partly in section, is shown in Fig. 1 and comprises a frame and table similar to an ordinary sewing machine. An endless belt *A* runs over a bridge *B*, provided with a depression or groove in its upper surface, and detachably resting on the pivoted angular pieces *C, C*, which may be swung away from the belt pulleys as indicated by the dotted lines on the left.

Chain *D* is connected to a treadle at the base of the machine, and passing through the angular arm, connects with the pivoted lever *E* (See Fig. 2) that bears against the bottom of the cement receptacle *F*, which is fastened to the cement chute *G*, sliding within an outer tube that is forced away from the angular arm by a powerful spring *H*. Thus, when the treadle is depressed the cement chute is raised and by spring action is forced away from the belt *A* to the position shown in Fig. 2.

In applying cement to objects of irregular outlines such as gas masks, the object is placed under a cam-follower attached to the cement chute evenly distributes the cement. For straight seams the cement chute is used in combination with the belt *A* as shown in Fig. 3. In applying cement to endless objects such as cuffs of rain coats the angular pieces *C, C*, are swung out of place and the object to be cemented is slipped laterally over the belt *A* (See Fig. 1). When cement is to be applied to adjacent overlapping edges of two objects, the fabric is forced into the depression in the bridge *B* by the cement chute, forming an angular configuration, so that both of the overlapping edges are cemented in an equal manner. (See Fig. 1.)

FIG. 1. ELEVATION PARTLY IN SECTION AT RIGHT ANGLE TO THE PLANE OF FIG. 2.

In order to cement pieces of fabric together, the tape shown in Fig. 1 is led from a reel to a roller *J*, that applies the tape

FIG. 2. SIDE ELEVATION. FIG. 3. DETAIL OF SIDE ELEVATION.

to the cemented fabric in passing. (Hirsh Milkewitz, Louis Gelacie and Saul Gelaru, New York, N. Y., United States patent No. 1,318,683.) Patent No. 1,318,661 granted to the same inventors covers features in the same machine.

OTHER MACHINERY PATENTS.

THE UNITED STATES.

- N^{O.} 1,317,848. Press for retreading tires. J. J. Wohlgenuth, Chicago, Ill.
- 1,317,849. Press for molding and vulcanizing tires. J. J. Wohlgenuth and L. L. Korach, Chicago, Ill.; said Korach assignor to said Wohlgenuth.

AUSTRALIA.

To Americans.

- 9,887. Vulcanizing rubber halfsole to fabric reinforcing strip to permit attaching tobaccos or shoes by stitching without liability of pulling out. F. A. Nolan, Minnesota, U. S. A.

GERMANY.

- 307,173. (February 21, 1917.) Process for making textiles impregnated with rubber. Wilhelm Deutsch, Vienna. (Austrian patent.) (October 20, 1915.)
- 308,277. (October 20, 1915.) Process for repairing rubber tires. Ludwig Victoria, Heusenstamm, in Hesse.
- 312,009. (March 18, 1916.) Process for making tires and preventing skidding. Karl Racher, Seebach, bei Villach (Austrian patent of December 1, 1915.)
- 313,281. (May 9, 1918.) Process for laying on rubber. Wilhelm Sachs, Berlin.
- 315,342. (December 20, 1918.) Process for giving a smooth surface to objects made from reclaimed rubber. Marie, widow Richter, born Haasmann, Dresden.

RUBBER EXPORTS FROM LONDON, ENGLAND, TO THE UNITED STATES from January to July, 1919, aggregated \$9,280,243, as compared with \$3,732,799 for the first seven months of 1918. The increase of rubber exports is particularly noticeable.

New Goods and Specialties.

THE "HOLD-NO-FONE."

EVERY NOW AND THEN some inventive mind develops a new form of telephone. While the principles involved are the same, as far as the transmission and receipt of messages are concerned, the outer form of the equipment may vary widely. The one here illustrated obviates the necessity for using

TELEPHONING WITH FREE HANDS.

the hands in any way in operating the device, once the connection has been made. A flexible horn is placed directly over the receiver, fastened by a spring. The receiver, with horn attached, is fastened to the telephone post and adjusted for either ear. The ear-piece is fitted with a soft rubber cushion, and a small weight fastened to the receiver hook makes and breaks connection when placed in position, leaving the hands entirely free for writing, holding papers, etc. At the same time the rubber ear-piece shuts out interfering local sounds. This device has been patented in the United States, the last patent having been granted during the present year. (Hold-No-Fone Co., 295 Fifth avenue, New York City.)

"FLEX-MET" TUBING.

The disadvantages of using rubber tubing protected by only a comparatively thin covering of silk, cotton, or other material easily punctured or burned, resulted in the development of the tube or hose protected by metal, necessarily in flexible form. One of the more recent styles is shown in the accompanying illustrations, which indicate, in addition to the flexible metal covering, the appearance of the tube terminal, taper plug, and retainer nut. (Breeze Manufacturing Co., Newark, New Jersey.)

A. T. F. "FLEX-MET" AIR HOSE

ASSEMBLED FLEXIBLE METAL HOSE.

A SHOE FOR WORK-PEOPLE.

The high price of leather footwear and the indisposition of shoe manufacturers to make strong, substantial shoes of the

THE "CRAFTSMAN" SHOE.

either white or brown, with the seams reinforced with leather. It has a rubber heel, a sole of red fiber and rubber, a liberal

foxing, and a special insole. Such a shoe gives comfort and service at a price low enough to bring it within reach of mechanics and other workers. It is made both high and low cut, and in men's and women's styles in all sizes, the smaller with spring heels. (La Crosse Rubber Mills Co., La Crosse, Wisconsin.)

"REPAIRO" SELF VULCANIZING PATCH.

A new rubber patch, which can be used by the amateur in mending articles of rubber or leather, is represented herewith.

THE "REPAIRO" PATCH.

The patch is cut to fit over the hole and is applied by means of the "Repairo" self-vulcanizing solution accompanying the outfit, after the surface of the article to be repaired has been roughened around the break or hole with sandpaper. (The Repairo Co., 39 West Adams street, Chicago, Illinois.)

"DUXRANE" FOR AUTOMOBILE TOPS.

A new material for automobile tops is called "Duxrane." It is made of single-ply rubberized fabric and will, it is claimed, stand the test of scrubbing, wrinkling, and rubbing, without sagging, cracking, or fading. The coating is extra heavy, which contributes to its beauty. (O'Bannon Corp., 200 Fifth avenue, New York City.)

"EAGLE" PUNCTURE-PROOF TIRE.

IN THE INDIA RUBBER WORLD for April 1, 1919, on page 369, appeared an illustrated description of a wheel equipped with the

"Eagle" puncture-proof tire. The design has since been considerably changed in application, but the theory has been retained. The two pneumatic tires have been altered from the former round shape to one that is round on top and pointed at the bottom, while the shape of the bottom of the solid rubber tire at the tread has been changed to fit the newer design. All three tires are now brought closer together. The solid tire upon which the wheel runs is vulcanized to a demountable steel rim, which is placed between the solid and the pneumatic tires. (The Eagle Puncture-Proof Tire Co., Inc., 1662 Broadway, New York City.)

THE "NEVER-LOOSEN" HEEL.

One of the newest heels is of solid rubber with a pneumatic suction space in the side applied to the shoe and a non-slip plug in the bottom. The unique feature of the "Never-Loosen" heel consists of a rand of fiber and rubber vulcanized to the heel when manufactured. By means of this rand the heel can be properly held in place

JOHN'S "NEVER-LOOSEN" HEEL.

by nailing, without cement or washers. (Jones Never-Loosen Rubber Heel Corp., 13 Park Row, New York City.)

FOR HOLIDAY TRAVEL.

A woman traveling in the holidays desires a toilet case as dainty as the home visited. For such the accompanying picture shows a silk outer case, plaided in pleasing colors, which contains a convenient, rubber-lined case with pockets to accommodate the toilet accessories. These include comb and brush, tooth brush, cold and dental creams, face cloth and soap, sandpaper strips, orange-wood stick, nail brush, powder puff in powder box with mirror inside, a convenient mirror with case back, and a paper of hair pins. The flaps on the pockets have loops of silk cord and the case itself fastens with loops over crystal buttons. There is a suitable hand strap for carrying, and a loop on the lining case by which that may be withdrawn from the outer one.

PLAID TRAVELING CASE.

PURSE-LIKE TOBACCO CONTAINER.

The container for tobacco and cigarette papers, shown in the photograph, is lined with rubber to preserve the natural moisture of the tobacco which may be within. There is a small pocket to accommodate cigarette papers, and the whole folds together like a purse and is held by a strap and snap fasteners. The case may be had in black fine-grained seal or tan pigskin, black cobra seal, or brown pin seal. It is five and one-half by four inches in size. Initials may be stamped above the fastener if desired.

NEW TOBACCO POUCH.

Both the cases are from the same house. (Mark Cross Co., 404 Fifth avenue, New York City.)

AUTOMATIC BARREL FILLER.

Garage men and others handling lubricating and other kinds of oil and a barrel filler a great convenience. One that is also automatic should meet with additional favor. That represented here includes the automatic feature and is fitted with three and one-half feet of metal-lined hose one and one-quarter inches in diameter. The automatic barrel filler may be had in larger and smaller sizes by those who desire, equipped with different lengths of hose. Fittings that are suitable for attaching the hose to the source of supply are included with the hose. (United Metal Hose Co., Inc., 89 Chambers street, New York City.)

"UNITED" AUTOMATIC BARREL FILLER.

RADIO HEAD SET FOR AIRPLANES.

In order to secure for radio equipment on airplanes a head set that would exclude the noise of the propeller and the effect of the rushing air, there was devised a form of aviator's helmet with telephone receivers mounted in it so as to fit the ears of the pilot or observer. A portion of it fits the face closely to prevent sounds other than the ones originating in the receiver from being heard by the wearer of the apparatus. A receiver is furnished for each ear, but instead of the hard-rubber ear-pieces, there are caps of sponge rubber. The receivers are held in place by means of the padded leather which composes the helmet, while adjustment is made by lacing the helmet to fit closely the wearer's head. The exclusion of sound is not so complete as to prevent the user from hearing the exhaust from the engine and thereby determining whether or not his motor is working properly.

RADIO HEAD SET; RUBBER EAR-CAPS.

A RAPSON NON-SLIP UNPUNCTURABLE TIRE.

A RAPSON TIRE.

Fred L. Rapson's development of the non-slip unpuncturable tire is composed of a heavy-tread cover and inner air tube, between which is inserted a rubber deflector so designed as to insure the greatest possible degree of resiliency. Containing, as it does, scientifically planned air pockets, the inner tube is protected and assured of cool running. The tires are made in nine sizes, including one for motorcycles, and are fundamentally pneumatic tires, but freed from the annoyances to which the use of ordinary pneumatics subjects the user. There are several different combinations of the component parts, one form of which requires a special rim and wheel, but in another which is suitable for fitting to existing rims, the tube lies close to the rim but not in contact with it and has the resilient rubber core around it on the sides and outer diameter. (Oylers, Limited, 35 New Cavendish street, London, W. 1, England.)

"JIFFY" FOR GOLF BALLS.

A compound for painting golf balls and the hangers for doing it efficiently without soiling the hands, will surely make a strong appeal to all who find pleasure in driving "little white pellets over the grass." The "Jiffy" compound, used with its accompanying stabilizer, will coat any ball and dry so quickly, it is claimed, that the ball can be put in the pocket in fifteen minutes and used on the golf course in an hour. (The Pittsburgh Economy League, Pittsburgh, Pennsylvania.)

"JIFFY" GOLF-BALL RENEWER.

THE "HYDRAMATIC" DRAIN-PIPE FLUSHER.**"HYDRAMATIC" FLUSHER.**

cleans out the waste accumulated in the trap of the drain pipe, and the aerostatic bulb multiplies this pressure when the condition requires. Daily use of this flusher for one minute, it is claimed, will keep the pipe from ever becoming clogged. (The

Bunker Hill Rubber Works, Bunker Hill, Illinois.)

**"JIFFY" BABY PANTS.**

The newest patent on baby pants made of rubber is represented in the illustration at the right. This is a one-piece all-rubber garment with elastic cemented within the hems at the waist and legs so that all strings and buttons are dispensed with. (I. B. Kleinert Rubber Co., 719 Broadway, New York City.)

**RUBBER BABY PANTS.****BOONE ARCH SUPPORT.****PNEUMATIC METATARSAL ARCH SUPPORT.**

A new arch support intended to relieve the pressure from the ball of the foot and raise the metatarsal phalangeal articulation has been recently patented, though it has been in use in the better grade of shoe stores for some time. It consists of a leather inner sole of the proper shape, to which is cemented a piece of rubber shaped to provide the necessary support and in which are a number of small vacuum cups to give the pneumatic effect. These supports are made to fit all sizes of men's and women's shoes and are carefully marked "right" and "left." (Estate of Selden H. Boone, George T. Kimmel, administrator, Chicago.)

THE "PASTIME" OUTING BALMORAL.

The high cut outing Balmoral pictured here is the result of a demand for high-laced footwear for real service in summer. It is made of a superior quality of bleached white duck, with white rubber foxing, the latter being narrow and inconspicuous. The shoe is quite high, with 16 pairs of white enameled eyelets. The sole and heel are of white rubber,

**"PASTIME BARMORAL."**

of a tough and serviceable quality. The heel is of comfortable walking height. The shoe is one which will commend itself for pedestrian service on summer outings, as well as for street wear. (Gutta Percha & Rubber, Limited, 47 Yonge street, Toronto, Ontario, Canada.)

**"MARATHON" RUNNING BOARD MAT.**

wear the floor covering below the accelerator pedal, rubber mats are now used with considerable satisfaction. The "Marathon" mat illustrated is intended for the running board and is 11½ by 8 inches in size, but a smaller one, half as wide, is provided for the floor under the accelerator pedal. (The Marathon Tire & Rubber Co., Cuyahoga Falls, Ohio.)

THE "ANTIGLARE" FOR AUTOMOBILES.

A contrivance which permits the automobile driver to derive the full benefit of the lights on his own car while protected from the glare of approaching lights on other cars is shown

**THE "AUTO ANTIGLARE."**

herewith as it appears in use. It is constructed of glass and metal to fit any windshield. The tops of the upright rods have hooked ends to fit over the edge of the windshield and the bottom ends are equipped with rubber suction cups which assist in holding the device in place. The "Auto Antiglare" may be used for either right or left hand driving and the glass can be raised or lowered. (The Portland Sales Company, Inc., 167 Oliver street, Boston, Massachusetts.)

**"DIAMOND GRIP" RUBBER HEEL.****"DIAMOND GRIP" HEEL.**

A new rubber heel has a cone-shaped portion sunk in the middle on the reverse side, while on the bottom is a diamond-shaped knurled portion immediately under the cone. This device provides automatic action said to prevent slipping. The heel is called the "Diamond Grip Don't Slip." (Robert E. Miller, Inc., 11 Broadway, New York City.)

Los Angeles Challenges Akron.

by Frederic North Shorey.

What the axis of the rubber manufacturing industry one day is shifted from Akron to Los Angeles? That is what Pacific Coast business men predict and the Goodyear Tire & Rubber Co.'s \$20,000,000 factory rapidly moving toward completion furnishes a basis for their optimism. They are confident that other rubber companies will be prompt in following and that soon rubber factories will be as common as the citrus groves and vineyards of Los Angeles. They are already mentally arranging locations for up-to-date plants that will turn out rubber footwear, clothing, insulated wires and cables, mechanical rubber goods, hard rubber, in fact all of the varied lines of the gum elastic product.

First among the advantages of Los Angeles is the climate which enables a factory manager to keep his plant going all the year around without the incidental troubles of heating to be considered. Where an eastern plant would, perhaps, be hampered by storms and inclement weather, a plant in southern California could run all the year around, a most important consideration as the overhead item of heating is reduced to a minimum.

The local market of southern California should not be overlooked as Los Angeles alone has a large number of stores, all of which handle rubber goods of every kind and description. There are eight dental supply houses, ten dental laboratories, 550 dentists, fourteen wholesale druggists and 300 retail druggists, all of which deal extensively in rubber goods. This does not include the populous and rapidly growing beach cities, such as Long Beach, Santa Monica and aristocratic Pasadena. There are at least 100,000 visitors every season to Los Angeles, including wealthy invalids from all over the world. The lighting and power companies adjacent to Los Angeles use thousands of miles of insulated wire which a local company could supply, while the housing problems for employes can be solved much easier than in any of the more populous eastern centers. Aside from local enthusiasm, there are sound reasons back of the Goodyear company's move, which apply equally to other great industrial enterprises, and particularly those making rubber goods. Some of these may well be presented for the consideration of other manufacturing concerns, which perhaps too long have been anchored in the more populous centers of the East.

In the first place, the population of the Pacific Coast is growing more rapidly than any other portion of the United States, and with it the rubber trade. Only two states in the Union exceed California in the number of automobiles and trucks used. These are Ohio with 417,400 automobiles registered in 1918, and Illinois with 389,135, while California is a good third with 351,863, and the first two states mentioned have double the population of California. Even New York has only 253,588 machines

and Pennsylvania, 370,110. So the use of automobiles in California, and especially around Los Angeles, creates a large demand for tires.

Regarding the advantages of Los Angeles itself, there is an abundance of good factory sites in almost any direction from its center, probably as good as that selected by the Goodyear company. The question of fuel is easily disposed of, as the city is

VIEW OF A PORTION OF THE WORK BEING DONE ON THE PLANT OF THE GOODYEAR TIRE & RUBBER CO., OF CALIFORNIA AT LOS ANGELES.

in the midst of an oil district, one of the biggest storage stations of the Standard Oil Co. being located but a few miles from the city limits on the coast, to which the oil is piped from the various wells by a pipe line. Efforts are now being made by the Standard and Union Oil companies to increase their product, drilling for new wells going on constantly. There are a number of oil wells in Los Angeles itself, only a short distance from the postoffice.

A large part of the crude rubber used in the United States now comes directly from the Far East through Pacific ports, to be transported to the rubber centers of the East. This extra haul can be avoided if the rubber is sent to factories located in Los Angeles. Moreover, the line from the Far East by way of Los Angeles over the southern roads is better than the route by way of Seattle and the railroads from Seattle to Akron, where in winter-time snow, ice and congestion seriously interfere with transportation. Thus, a continued flow of traffic may be

MEMBERS OF THE GOODYEAR TIRE & RUBBER CO.'S OFFICE FORCE AT LOS ANGELES, NOVEMBER 1, 1919.

obtained at a lower cost than is possible over the northern routes. It is also within the realms of probability that the "machine grown rubber" from California, Arizona and Texas will one day furnish another reason in favor of Los Angeles. The natural center for cotton shipments coming from the Imperial and San Joaquin valleys and the rapidly growing fields of Arizona, is Los Angeles. In addition to this it has preferential rates from all Texas points for export cotton. The Goodyear company takes advantage of this nearness to the cotton fields by the establishment of its cotton factory for the manufacture of fabric to be used in its tire industry. Furthermore, sulphur, talc, asbestos and many other ingredients used in rubber compounding are to be found within our own borders and will be available upon demand.

As for outlets for manufactured goods in addition to the local market there is the overseas market, Japan, China, Oceania, Australia and India. So also the east and west coast of South America, South Africa and even Europe are more accessible than they are in Akron.

The harbor facilities of Los Angeles are particularly advantageous for industrial enterprises. It is declared that freight can be handled there at 10 per cent less than in any other port on the coast. The United States has spent approximately \$6,000,000 on the breakwater, jetties and dredging in the harbor, and wharves, freight sheds, warehouses, railroad terminals, paved streets and other facilities have been constructed for the economical handling of freight.

It is claimed that the largest and perhaps the finest pier in America has been built in the outer harbor. It is more than half a mile long and 650 feet wide. It was constructed by building a rock bulkhead around the area and filling in the center with solid earth dredged out of the harbor in digging channels. These channels were made 35 feet deep on each side of the pier.

A reinforced concrete wharf 2,500 feet long and 40 feet wide was built along the west side of this pier, and a freight shed of steel and asbestos-protected metal was built on and back of this wharf. More than two miles of railroad tracks and a paved street were built to serve this wharf and shed.

Last, but not least, among the city's biggest assets are its open-shop policy and traditions. When the longshoremen's strike tied up the San Francisco water front and sent vessels to Los Angeles to be unloaded dock work went ahead here uninterruptedly, in spite of the strike. Free labor has always been insisted upon, and attempts at strikes, whether by agitator elements, within or without the city, have invariably proved failures, as witness the recent attempt to cut the city off by a railroad strike in sympathy with the carmen's strike in that city, both of which were called off, after it was seen there was no hope of success. A shipbuilding strike at the yard in the harbor, which lasted for several months, was also called off, the agitators who had stirred up the trouble abandoning their efforts in disgust.

Los Angeles County alone has 107,000 automobiles and 15,000 trucks, fully one-third of all those in the State. There are 75 automobile agencies in the city, representing all the standard makes of machines made in the United States, 250 garages and over 200 tire agencies, to say nothing of oil stations, electric service stations and the like. The county highway system has 470 miles of good roads and the city 1,500 miles of paved streets. Southern California itself has 2,368 miles of paved highways and 10,000 miles of highly improved roads extending from Los Angeles to the Mexican border and to the northern extremities of the State. The State itself purposes to improve this system greatly in the coming year through the \$40,000,000 bond issue voted at the last election.

There are reports that other rubber companies, following the example of the Goodyear company, are already negotiating for

sites, but no definite announcement has yet been made. Three other rubber companies have plants located in southern California, all in the vicinity of Los Angeles; the Hendrie Tire Co. at Torrance, the industrial city in close proximity to the harbor; the Samson Tire & Rubber Co. at Compton, a suburban town on the line of Long Beach, and the Savage Tire Co., with its main plant at San Diego, and a branch in Los Angeles.

PRACTICAL HINTS ON RETREADING.

By A. B. Zuehl.

A RECENT TRIP through the East afforded the writer an opportunity to observe the manner in which the business of tire retreading is carried on. It was noticeable that some repair men are careless in their work and reckless in guaranteeing poor workmanship, while others waste time and work on worthless tires, all of which brings retreading into disrepute. Therefore, some practical suggestions which should be helpful to all who engage in the industry of retreading tires may be of interest.

The first step toward a successful business is to pick out first-class tires to retread or to substitute such tires as are worth retreading. First-class work is essential and it may pay in the end to reject two-thirds of the tires brought in for retreading, if they are of poor quality. The tire should be of standard make for these are made of material of good quality and are usually suitable for retreading. A good cord tire, such as are becoming rapidly more popular, invariably wears out the original tread. The added cost of a cord casing makes the owner try to economize by turning to retreading.

Moisture in a carcass is very detrimental to retreading a tire. The carcass should be thoroughly dry; otherwise the casing is sure to bulge when subjected to the heat of the mold. It is always advisable to remove the tread in the usual manner and, after buffing, to dry the tire thoroughly in a vacuum drying oven or in the heated mold itself. Three periods of thirty minutes each are sufficient to dry thoroughly any ordinary casing. Unless dried a tire when built up and placed in a mold will expand and separate the plies of fabrics or cord. When the plies are separated the tire becomes weak. Expansion is caused by gas or steam and makes it difficult to remove the tire from the mold.

Many successful men reline their tires; not with the ordinary inner liner, made of inferior material and lacking shape to set in the tire, but with a first-class shaped liner, preferably one taken from an adjusted or rim cut tire. This liner can be made by any repair man or may be purchased from a supply house handling vulcanizer supplies.

There are complaints of improper fitting and stitching down of liners which do not conform to the curve of the tire, thus causing friction, heat and endless tube pinches and other troubles. Experience proves that a liner, properly inserted, stitched and vulcanized (not cemented), with the addition of the pressure obtained from the new types of vulcanizers and retreaders, fortifies the tire; the liner becomes a part of the tire itself, preventing blowouts and like accidents.

Care must be taken with steaming and the preparation of the carcass. It pays to remove the tread and old breaker of a tire. Often the outside ply of fabric is water-soaked, which causes the fabric to deteriorate and become hard and glazed, making it difficult for the cement to adhere or soak into it. This ply of fabric may be removed profitably when a three-ply liner is inserted because two extra plies are then added.

The reinforcing of tires should be done from the inside, for it is a waste of expensive fabric to apply it on the outside. The necessary repairs to a casing should be made before adding the new tread. The repairs should be at least semi-cured, as the cure of retreading and repairs in one operation has not proved successful. Complaints are heard of low spots on tires; these are usually caused by insufficient sand in the sand bags, by the pock-

eting or trapping of air, by improper tightening of clamps and other causes.

Retreading materials should be especially compounded and ordinary repair stocks should not be used. It is always well to have the proper tools. A heavy tread roller is a good investment and also a time-saver. A porcupine roller saves labor by rolling out the air blisters. A few dollars spent on necessary and labor-saving tools enable a man to turn out a first-class job. Neatness, too, is a requisite. It is just as easy to turn out a neat job as a slovenly one. Why not have a place for every tool and wrench and have the clamps, bars and bags arranged neatly on a shelf or rack?

In a small shop visited in Canada the work was perfect in every detail. The foreman said he seldom had two "touch ups" in a week. The secret of his good work lay in the foundation of his molds. These were polished after every cure with very fine sandpaper or steel wool. A few hours devoted to the surface of the molds, to cleaning them and keeping them clean, will prove profitable. For this purpose, though solutions of various kinds are used, plain Castile soap of the highest quality obtainable is excellent. A light film of this, diluted in water, should be painted on the molds; this will keep the rubber from sticking to the molds, will do away with air pockets and will maintain an even flow of rubber.

SPlicing BALATA BELTING.

BALATA AND RUBBER differ radically in their nature and properties, which necessitates very different methods of treatment in their manufacture. Balata belt making, previously described in detail in *THE INDIA RUBBER WORLD*, May 1, 1919, does not include vulcanization as in the case of rubber and this makes the process of splicing balata belting a specifically different process. The preparation of the ends requires the use of a square, a knife, and a warming iron for softening the balata, to permit separation of the plies, a special scraper for use on the balata surface, and balata cement, a solution of balata in a volatile solvent.

The preparation of the belting for a splice, in either rubber or balata, involves removal of the duck plies of each end to be

(R. & J. Dick, Limited.)

THE PLYS OF EACH END OF THE BELT BEING REMOVED IN SEVERAL STEPS, IT IS READY FOR SPlicing.

joined in a series of steps spaced so that each end will replace the removed portions of the opposite sides of the joint.

The prepared surfaces having been warmed by radiation from the red-hot iron heater held a short distance over them, are brush coated with the balata solution. The surfaces are dried

perfectly by about 30 minutes' exposure. The laps are heated until they are very tacky, when they are carefully matched and clamped together in a suitable bench belt press, which has been well wetted to prevent the belt from sticking to it. The splice remains under moderate pressure for about ten minutes. After

(R. & J. Dick, Limited.)

THE CEMENTED ENDS OF THE BELT ARE JOINED AND SUBJECTED TO MODERATE PRESSURE ON A BELT PRESS.

removal from the press the joint is cooled in water and strengthened by sewing or riveting, or by diamond stitching with rawhide.

PILOT BALLOONS.

ONE REMARKABLE new development brought on by the war has been the scientific observation of the upper air, the measurement of horizontal and vertical distance, the marking of air currents in which the departments of the Government have shared—the War Department, the Navy and the Meteorological Section of the Department of Agriculture. Very soon they found it possible to work in harmony with each other and also with the air services of Great Britain, France and Italy.

Hundreds of young men were trained in the Signal Corps and other branches to take the necessary observations and many accompanied the forces abroad. The Ordnance Department needed the information because the knowledge of air conditions was essential in the handling of guns; that knowledge was vital to the men who went up in airplanes and dirigibles, whether fighting at the front or carrying mails and despatches; it was needed by the Navy for vessels and airships.

Among the instruments found useful were the little pilot balloons made of rubber. They were used to determine altitude conditions, air currents at different elevations and the velocity of the winds, and, when the armistice was signed, were about to be sent over enemy lands to distribute literature that might disconcert the foe.

The balloons used had to admit of high inflation and to have as little weight as possible. They were made of rubber, so cured as to retain its elasticity for a while and to allow the hydrogen to diffuse only slowly through its walls. Pure rubber balloons of a spherical shape were used, either uncolored for use against a clear sky or dark red for cloudy weather. The smaller size inflated to a diameter of 80 centimeters, weighing 20 or 30 grams, the larger, of 120-centimeter diameter, weighed 50 to 60 grams. It was very difficult to manufacture satisfactory balloons larger than 9 inches in diameter when uninflated.

The balloon ascends at a remarkably constant rate, about 10 feet a second. It is kept in sight up to distances as far as 60

miles away horizontally and nearly 20 miles perpendicularly. The rapid diffusion of hydrogen through the rubber had made flights of over a hundred miles impossible. Through an ingenious improvement, the addition of a bellyband which kept the girth of the balloon constant at a diameter of 4 feet through the discharge, while shrinking, of a few drops of kerosene, the balloon rises to higher levels until its ballast of kerosene or alcohol is exhausted.

In the first week of October, 1918, 60 such balloons, adjusted to fly between 15,000 and 25,000 feet altitude, were let loose from Fort Omaha, Nebraska; 34 of these were picked up and returned to Washington. One came down within 10 miles of New York, 1,100 miles from the starting point; another in Virginia, 930 miles away. The rest were scattered over Ohio, Kentucky, Illinois, Wisconsin and Iowa. Not one went west from Omaha.

By the fall of 1918 there were 26 upper air stations distributed over the United States; daily charts are constructed showing the

BEGINNING OF A PILOT BALLOON RUN.

wind direction and speed 500 meters above the ground with other charts for 1,000, 1,500, 2,000, 3,000 and 4, meters. It is now possible to map out the upper airways across the Atlantic as the steamers are sending up long-range balloons that drop down in Western Europe.

While great improvements were made and are being made in the instruments for accurate scientific observation it was found necessary also to devise simpler means for quick observation in the field and for rapid calculation. The Signal and the Meteorological services have developed a whole mathematical science from the formulas derived from observing the motion and variations of the pilot balloons.

NEW INCORPORATIONS.

Akron Tire Co., Inc., October 8 (Delaware), authorized capital 100,000 shares without nominal or par value. B. Ruskay, 19 West 69th street; F. E. Wyson, 202 Riverside Drive—both of New York City; D. W. Steele, Jr., Brighton Beach, Brooklyn—both in New York. Delaware agent, United States Corp. Co., 311 South State street, Dover, Delaware. Home office, Honeywell and Milliken avenues, Long Island City, N. Y. To build, rebuild, and construct tires, tubes, and all other kinds of automobile accessories.

Automatic Tire Machine Corp., November 12 (New York), \$150,000. H. G. E. Smith, Buffalo; S. H. Millener, Tonawanda—both in New York;

W. A. Schaffer, Detroit, Michigan. To manufacture machines for weaving and rubberizing fabrics.

Cell Tube Tire Co., The, November 17 (Delaware), \$300,000. R. M. Barrett, M. B. Burt, J. M. Lee, all of Wilmington, Delaware. To license agent, Colonial Charter Co., 927 Market street, Wilmington, Delaware. To deal and trade in rubber.

Consolidated Tire & Rubber Mfg. Co., Inc., October 6 (Massachusetts), \$100,000. A. A. Page, 1234 First street, Boston; J. E. McMill, 17 Lincoln street, Dorchester; W. C. McCallum, 13 Netherlands Road, Brookline—all in Massachusetts. Principal office, Boston, Massachusetts. To manufacture, repair, rebuild, and deal in automobile tires, rubber shoes, soles, heels, rubber and rubberoid.

Dunlap Tire & Rubber Co., September 25 (West Virginia), \$14,000. R. W. Frieser, C. R. Wesley, F. B. Pettit—all of Kent, Ohio; D. O. Blagg, W. T. Moore, both of Charleston, West Virginia. Principal office, Charleston, West Virginia. To manufacture rubber goods.

Elat Rubber Co., The, August 26 (Ohio), \$50,000. W. H. Stillwell, president; J. A. Seabury, vice-president; E. F. Ast, secretary, treasurer and purchasing agent. Principal office, 31 East Vermilion street, Cuyahoga Falls, Ohio. To manufacture mechanical rubber booth and automobile inner tubes.

Eureka Rubber Cement Co., Inc., October 23 (New York), \$50,000. L. M. and L. M. Halpern, both of 2868 Heath avenue, Bronx, New York; W. F. Law, Maplewood, New Jersey. To deal in rubber and rubber cement.

Fay & Young, Rubber Corp., November 18 (New Jersey), \$35,000. M. L. Youngs; C. R. Fay, both of Mt. Vernon, New Jersey; F. H. Miller; A. M. Youngs, both of Trenton, New Jersey. Principal office, 163 Park street, Trenton, New Jersey. Agent in charge, E. H. Miller. To manufacture, buy, sell, import, export, trade and deal in druggists' rubber goods, etc.

General Tire Co., Inc., The, November 21 (New York), \$10,000. E. J. Hogerty; T. A. McCole; J. P. Fearn—all of 170 Broadway, New York City. To manufacture rubber products.

Gordon Pen Co., October 21 (New Jersey), \$50,000. R. J. Heitzman, 217 Fourth street; W. Gordon, 646 Lewis street, both of Union Hill, J. A. Heitzman, 101 Palisade avenue, West New York, New Jersey. Principal office, 101 Palisade avenue, West New York, New Jersey. Agent in charge, R. J. Heitzman. To manufacture, buy, sell, import, and generally deal in syrographic and fountain pens.

Keystone Tire & Rubber Co., Inc., November 21 (New York), \$5,000. J. Jacobs, S. Bernheim, W. Loewenthal—all of 1877 Broadway, New York City. To manufacture tires.

Knox Tire & Rubber Co., The, June 27 (Ohio), \$2,000,000. B. E. Frantz, president; E. S. Cannell, vice-president; F. D. Spencer, secretary and treasurer. Principal office, Mt. Vernon, Ohio. To manufacture tires and tubes.

Kokomobile Tire & Supply Co., Inc., November 7 (New York), \$25,000. C. W. Burrell, C. D. Wilkins; R. V. Henery—all of Buffalo, New York. To manufacture rubber goods.

McEwen Tire Ventilator Co., Inc., November 20 (New York), \$100,000. J. H. Rosen, Mt. Vernon; S. S. Rosen, Monterey Hotel, New York City, both in New York; T. McEwen, Caldwell, New Jersey. To manufacture automobile tires.

Mandler Tire Co., Inc., October 24 (New York), \$5,000. H. and M. Mandler, both of 117 West 113th street; S. Silverman, 23 Nicholas avenue and 118th street—both in New York City. To manufacture tires. Needham Tire & Rubber Co. of New York, Inc., October 24 (New York), \$100,000. H. A. Rambonnet, E. A. Rambonnet, both of 233 J. C. Constable, Plainfield, New Jersey; E. C. Klepper, 967 St. Johns Place, Brooklyn, New York. Office address, 1695 Broadway, New York City. To manufacture tires.

New Method Tire Corp., November 17 (New Jersey), \$50,000. B. De Mattia, 10 Maple Place; P. De Mattia, 40 Union avenue, both of Clinton; O. E. Basten, 37 East Pierpont avenue, Ruthersville, Ohio; C. J. Smith, 2700 street; J. A. Crowley, 113 Sherman street; J. H. McGuire, 293 Harrison street, the last three of Passaic—all in New Jersey. Principal office, 1 Wellington street, Clifton, Passaic county, New Jersey. Agent in charge, P. De Mattia. To manufacture rubber tires.

Paramount Rubber Consolidated, Inc., November 12 (Delaware), \$2,000,000. T. L. Croteau; P. B. Drew; E. H. Knox—all of Wilmington, Delaware. Delaware agent, Corporation Trust Co. of America, Du Pont Building, Wilmington, Delaware. To manufacture and deal in rubber goods.

Robert-Irwin Mfg. Co., Inc., November 17 (New York), \$30,000. Irwin and Aaron Berkowitz, M. Rappaport—all of 179 Wooster street, New York City. Principal office, 179 Wooster street, New York City. To manufacture auto tire pumps.

Smith Rubber & Tire Co., Inc., The, September 27 (New Jersey), \$1,000,000. F. H. Jr., Secretary, both of Ruthersville, Ohio; A. Hopkins, Passaic—all in New Jersey. Principal office, lawyers' Building, Passaic, New Jersey. Agent in charge, F. W. Smith. To manufacture, buy, sell, and deal in all kinds of automobile rubber goods.

Socon Inner Tube Co., November 13 (Delaware), \$50,000. T. L. Croteau; P. B. Drew; H. E. Knox—all of Wilmington, Delaware. Delaware agent, Corporation Trust Co. of America, Du Pont Building, Wilmington, Delaware. To manufacture and deal in tires and tubes.

Stanton-Haskell Tire Corp., November 7 (New York), \$20,000. N. D. Haskell, Buffalo; H. E. Haskell, Youngstown; H. E. Stanton, Rochester—all in New York. Principal office, Youngstown, New York. To manufacture tires.

Thompson-Goodyear Rubber Corp., October 21 (New Jersey), \$50,000. L. P. Thompson, 202 Market street, Newark; T. Wright, 103 Midland avenue, Montclair—both in New Jersey; A. S. Wright, 52 William street, New York City. Principal office, 202 Market street, Newark, New Jersey. Agent in charge, T. Stryker. To manufacture, buy, sell, and deal in rubber goods of all kinds.

Tire Improvement Corp., November 26 (New York), \$33,750. L. C. Kendall, 423 West 147th street; C. T. Hoskins, 26 E. 10th street; M. Roberts, 390 Wadsworth avenue—all of New York City. To manufacture tires.

United Tire Stores, Inc., October 18 (New York), \$5,000. S. Jarvis, 325 West 93rd street; G. A. McLaughlin, 680 West End avenue; M. J. Moon, 2 Rector street—all of New York City. Principal office, Brooklyn, New York. To deal in tires.

University Rubber Co., Inc., October 9 (Delaware), \$600,000. W. Mackay; C. E. Barker; J. H. Jones—all of 9 East 40th street, New York City. Principal office, 1000 Market street, Philadelphia. To manufacture, buy, sell, and deal in all kinds of rubber goods.

Value Tire & Rubber Co., Inc., November 1 (New York), \$4,000. J. Jacobs, S. Bernheim; W. Loewenthal—all of 1877 Broadway, New York City. To manufacture tires.

THE EDITOR'S BOOK TABLE.

"DETERMINATION OF PERMEABILITY OF BALLOON FABRICS," by J. M. Davis, D. E. Davis, Asst. Chemist, Bureau of Standards, Government Printing Office, Washington, D. C.

This is pamphlet No. 113 of the Technologic Papers of the Bureau of Standards. The paper discusses the theory of the permeability of balloon fabrics, methods of determination, standard test, operating directions and calculations. The bulletin is sold by the Superintendent of Public Documents, Washington, D. C.

"THE INDUSTRIAL REPUBLIC" BY PAUL W. LITCHFIELD, The Goodyear Tire & Rubber Co., Akron, Ohio. (Paper, 16 mo., 73 pages.)

With thinking persons everywhere giving serious attention to the complex industrial and economic conditions existing throughout the world, and with governments attempting to effect a working agreement between capital and labor, the appearance of this little book is most opportune. It is written by a man who has spent his life employing labor, and who as vice-president and factory manager of one of the largest American rubber plants has had opportunity to know the industrial situation from every angle.

Mr. Litchfield discusses frankly and freely the labor and economic problems now confronting the United States and suggests possible solutions. He traces the history of labor and industry and concludes that autocratic capitalism must come to an end, just as autocratic political government is being cast off. Harmony and justice to all, he believes, will be assured only through participation of labor in the management and ownership of large industrial plants. The step recently taken by the Goodyear Tire & Rubber Co. in creating a council of industrial relations is a start in the direction that all big companies will ultimately see their way to follow.

Wages, he asserts, should be determined by the results of labor rather than by the time consumed, since capital cannot sell time but only the products of labor.

As capital has taken all the risks of business it has been customary for it to claim all the rewards except what was necessary to pay for labor, materials and other charges. As a result of this system two classes have grown up, one interested only in profits and the other only in wages. This condition can be overcome only by bringing about a community of interest.

He declares that if labor has received the current wage and capital the current rate of interest, then the profits which have been produced are the result of both labor and capital and should be divided between the two.

In working this out Mr. Litchfield would give labor representation in the management of the business, but until labor is in a position to bear its share of the financial risks, capital must be in control of the management. He advocates that employees be given the fullest opportunity to invest in the securities of the company for which they work and as stockholders to share in the distribution of profits as they are earned.

Mr. Litchfield takes a daring stand regarding the respective rights and duties of men and management, and the part to be played by labor in the future development of American history. He clears up numerous points not generally understood and presents many new and advanced ideas bearing on this vital issue of the hour. Many big employers of labor may not altogether agree with him, but his conclusions are bound to receive widespread attention because of his long experience and high position in the industrial world.

EXTRAIT DU BULLETIN DE LA SOCIÉTÉ INDUSTRIELLE DE ROUEN, N. 4, 10 (Juillet), 1919. André du Bosc. Published by J. Gireaud, 58 Rue des Carmes, Rouen, France. (Paper, 12 pages.)

This reprint from the "Rouen Industrial Society Bulletin" consists of notes and papers by André Dubose on the "Destructive Distillation of Vulcanized Rubber"; "Devulcanization of Rubber

by Accelerators," and "Devulcanization of Rubber by the Formation of Hexamethylene Tetramine in Rubber."

"DIRECT DETERMINATION OF INDIA RUBBER BY THE NITRO-SITE METHOD," Technologic Papers of the Bureau of Standards, No. 145, by John R. Tuttle and Louis Yarrow. Issued October 22, 1919, by the Government Printing Office, Washington, D. C.

This is the official publication of a paper read at Boston, September 12, 1919, at the meeting of the Rubber Section of the American Chemical Society, and abstracted in THE INDIA RUBBER WORLD, October 1, 1919, page 17.

NEW TRADE PUBLICATIONS.

BLACK & DECKER MANUFACTURING CO., BALTIMORE, MARYLAND, is sending out a beautiful illustrated price list and catalog of its electric air-compressors and Electroflators for inflating tires, and portable electric drills and valve grinders for use in tire factories, garages and repair establishments. The cuts of these various machines and tools show the details of construction most efficiently. The book is handsomely printed in two colors and tastefully bound, and the accompanying descriptions are full and lucid.

"UNDER COVER" IS THE TITLE OF AN ATTRACTIVE LITTLE 24-PAGE magazine published by the H. H. Robertson Co., Pittsburgh, Pennsylvania, manufacturer of hydro-carbons and mineral rubber. While the publication is intended primarily for distribution among the employees of the company at its three manufacturing plants and its sixteen offices and agencies, it contains some bright snappy reading of general interest, and information regarding the company and its products. It is copiously illustrated with exceptionally good pictures.

A VERY HANDSOME AND DIGNIFIED PORTFOLIO OF PLACARDS APPEALING to the public to trust to the recommendations of dealers in tires is issued by The Marathon Tire & Rubber Co., Cuyahoga Falls, Ohio, with the general title "Building Good Will for You." While the sheets bear the name of the Marathon company they form part of a general advertising campaign designed to benefit all tire dealers.

This company also began recently to publish "Angles," an eight-page pamphlet, as its official organ. This issues monthly for the benefit of tire dealers.

THE BELDEN MANUFACTURING CO., CHICAGO, ILLINOIS, HAS published a neat 20-page pamphlet describing its business, the manufacture to order of articles molded from plastic materials such as Condensite, Bakelite, etc., giving much information to customers and prospective patrons. A large number of products are pictured and described.

"WEATHER AND HOW IT IS MANUFACTURED" IS THE TITLE OF a handsome 60-page brochure published by the Carrier Engineering Corp., New York City, explaining by halftone and text the necessities for dry or humid air in many manufacturing industries, and its various humidity and temperature-regulating devices, by which it claims ability to suit the exacting requirements for best results in factories. The book abounds in excellent illustrations of establishments where the concern's apparatus is installed. Among these are shown the drying room and the dehumidifying apparatus at the New York Belting & Packing Co., at Passaic, New Jersey. The book is substantially bound in board covers, with an attractive etching above the title.

AT LEAST ONE PRODUCER IN MALAYA CAN STAND FURTHER declines in the price of rubber, for the manager of the Kuala Selangor company reported that the output of 625,000 pounds had cost 7½ pence a pound to produce.

JUDICIAL DECISIONS.

DUBBLE FABRIC TIRE CO. vs. GENERAL TIRE & RUBBER CO.—In equity, District Court, Northern District of Ohio, Eastern Division, August 12, 1919.

Patent No. 964,446, for a blow-out patch for use in reinforcing or repairing automobile tire casings, was declared invalid on the grounds of want of invention and of prior public use. Four persons in repair shops in Ohio, Pennsylvania and New York testified that they had used similar patches and the identical process before the patent was granted. Bill was dismissed. (See *THE INDIA RUBBER WORLD*, September 1, 1919. (Federal Reporter, Volume 258, page 932).)

FEATHEREDGE RUBBER CO. vs. MILLER RUBBER CO. ET AL.—Circuit Court of Appeals, Sixth Circuit, June 30, 1919.

Patent No. 1,045,234, issued to Willis and Felix for a process for making artificial sponges, which had passed duly to the Featheredge company, was declared invalid because the disclosure of the process in the patent is not sufficient to enable one skilled in the art to manufacture sponges with commercial success.

It was shown that the president of The B. F. Goodrich Co. had brought back from Russia the identical process, and after making many sponges had stopped the manufacture because it was unsatisfactory. No rubber sponges were made successfully without paragon, a later invention which the plaintiff used but did not declare in the patent, and which the defendant also used. Judgment of lower court affirmed. (See *THE INDIA RUBBER WORLD*, November 1, 1918.) (Federal Reporter, Volume 259, page 563.)

TREASURY DECISIONS.

No. 43444.—Protest 930346 of F. W. Myers & Co. (Detroit).

RUBBER BUFFING SCRAP.—Waste scrap rubber buffing, classified as waste not specially provided for at 10 per cent ad valorem under paragraph 384, tariff act of 1913, is claimed free of duty under paragraph 513 as scrap rubber fit only for manufacture.

Opinion by G. A. Adamson: While the statute does not specifically mention the word "buffing," the merchandise was held to come squarely within the provisions of paragraph 513. United States v. Michelin Tire Co. (1 Court Customs Appeals, 518, T. D. 31544) noted. (Treasury Decisions, Volume 37, No. 19, page 37.)

No. 43456.—Protest 931900 of American Chic Co. (Buffalo).

CHICLE.—Dissected chicle classified at 20 cents per pound is claimed dutiable at 15 cents per pound under paragraph 36, tariff act of 1913.

Opinion by G. A. McClelland: The assessment of duty appearing to be in harmony with G. A. 7984 (T. D. 36788) and abstract 41818, affirmed in *Sheldon v. United States* (8 Court of Customs, Appeals, 9; T. D. 37123) and *American Chic Co. v. United States* (9 Court Customs Appeals; T. D. 37841), the protest was overruled. (Treasury Decisions, Volume 37, No. 20, page 15.)

DECISIONS OF THE FEDERAL TRADE COMMISSION.

FEDERAL TRADE COMMISSION vs. WILLIAM T. BATCHELOR.

GEORGE BATCHELLER AND AKRON TIRE CO., INC. (Long Island City, New York).

The respondents were cited to appear in March last with E. P. Jones and others before the Federal Trade Commission on the charge of repairing automobile tires and selling them as new with false representations as to their being able to run 4,500 miles. The commission on September 25, 1919, found that the respondents used unfair methods of competition, in the identical words of its decision against the other respondents, delivered last April, reported in *THE INDIA RUBBER WORLD* for May 1, 1919, and enjoined them from making false statements, from offering for sale reconstructed tires without distinct indication that they

are rebuilt and from advertising that the tires can give service for 4,000 miles. (Federal Trade Commission, Docket 253, September 25, 1918.)

THE OBITUARY RECORD.
HEAD OF THIRTY-TWO RUBBER STORES.

WILBUR S. ALLING, head of the Alling Rubber Co., which has retail stores in many cities of Connecticut, Massachusetts, and neighboring states, died suddenly November 15, 1919, at a hotel in Willimantic, Connecticut, to which place he had gone with his son in order to purchase a business block that should contain the thirty-third retail rubber store of their company.

Mr. Alling was born in Oxford, Connecticut, March 18, 1859, of Puritan stock, the son of Edwin J. and Laura (Bigelow) Alling. He descended in the direct line from Roger Alling of Kempster, England, who settled in New Haven in 1638, was treasurer of the colony for thirty years and deacon of the Centre Church. His residence was on the land now between Church and Chapel streets, and on it stands to-day one of the Alling stores. Mr. Alling's father was a merchant and farmer and is still alive; he volunteered at the first call in New Haven, fought through the four years of the Civil war and was severely wounded at Atlanta.

Mr. Alling was educated in the country school at Oxford, and when seventeen clerked in a country store at New Hartford. By 1887 he had established a rubber store in partnership with his brother, Noyes E. Alling, a business which has developed into a chain of 32 retail stores in six states. At the same time he started the Morgan Silver Plate Co., of Winsted, of which he was president until his death. He was married in 1881 to Mary Edna Tiffany, by whom he had five children, three of whom survive; Mrs. Edna Alling Smith, Ward Tiffany Alling, and Sidney Bigelow Alling. The family moved to Norwich in 1890, and Mrs. Alling died in 1901. Mr. Alling married again, in 1906, Minnie Smith, who survives him. He also leaves four brothers, all of whom were associated with him in business.

Mr. Alling was one of the largest holders of real estate in Norwich; he was a member of the Chamber of Commerce in that city and of the Dime Savings Bank corporation, and was an active worker in the Congregational Church and in the Y. M. C. A. He was a representative in the Connecticut State Legislature for two terms.

FORMER RUBBER FACTORY ENGINEER.

Charles H. Cary, who was formerly chief engineer at the factory of the National India Rubber Co., Bristol, Connecticut, but was retired a quarter of a century ago, died October 19, 1919, at the Rhode Island Hospital, Providence, where he had been undergoing treatment for a week. He was 73 years old and was born in East Hampton, Maine.

THE DELAYED PUBLICATION OF THIS ISSUE MAKES POSSIBLE THE notice of the death of George E. B. Putnam that occurred early in December. He was well known in the shoe, leather and rubber industries as a writer and journalist. A complete obituary will be published in the January number.

INDEX TO "RUBBER MACHINERY" WILL BE SENT FREE UPON REQUEST.

WILBUR S. ALLING.

Activities of The Rubber Association of America.

DIVISION MEETINGS.

RECLAIMERS' DIVISION.—The Rubber Reclaimers' Division held its first meeting in several months on November 6 at the Yale Club and a number of matters of general interest were given attention, the most important being the revision of the standards of scrap rubber specifications and packing, which are to be reissued as soon as they can be printed.

MECHANICAL RUBBER GOODS MANUFACTURERS' DIVISION.—On November 18 the Executive Committee of the Mechanical Rubber Goods Manufacturers' Division held its regular monthly meeting, which was well attended, and a number of subjects of considerable interest to the division were given attention. As no definite conclusions were reached with respect to the more important of the subjects, no announcement of the results can be made at this time.

SOLID AND PNEUMATIC TIRE MANUFACTURERS' DIVISION.—The Joint Executive Tire Committee, which meets regularly every month, held its November meeting on the 19th and disposed of a large docket which included subjects of considerable importance to the industry, the conclusions of which are to be submitted to all members of the tire divisions for ratification before being made effective. The indications are that if the work of the Executive Committee continues to increase it will soon be necessary for the committee to give more than one day a month to division matters.

THE TRAFFIC DEPARTMENT.—The Traffic Committee held its regular monthly meeting on November 20 and the usual interesting meeting was had and a large docket was handled. Among the subjects of principal interest were the proposal to secure more favorable rates in the West to cover mixed carload shipments of rubber goods, and the policy to be pursued by the carriers after their relinquishment by the Government in connection with the handling of claims.

DIVISION ANNUAL MEETINGS.—It has been the practice for all divisions to hold their annual division meetings coincident with the annual meeting of The Rubber Association of America, Inc., which is scheduled for January 5 at the Waldorf-Astoria, New York City. Division meetings have usually been held on the morning of the day of the annual meeting or the afternoon of the day before, but as January 5 is a Monday, some deviation from the usual practice is necessary and division meetings may have to be held later in the week. A program embodying the schedule for all meetings of divisions or special committees is to be issued as soon as possible.

NEW MEMBERS.

At recent meetings of the Executive Committee of the association the following named new members have been elected, the first three to firm membership and the last to associate membership:

Washington Tire & Rubber Co., Spokane, Washington.
A. C. Spencer-Hess, New York City.
W. J. McDavid & Co., Inc., New York City.
Arthur B. Newhall, Hood Rubber Co., Watertown, Massachusetts.

FORMATION OF INDUSTRIAL RELATIONS COMMITTEE.

The Board of Directors of the Rubber Association has authorized the formation of an industrial relations committee for the association which is to serve as a medium for the discussion and exchange of ideas respecting industrial relations. The term "industrial relations" is used in the broad sense as having reference to all of the conditions attached to the relation of em-

ployer and employee, including employment, sanitation, recreation, shop rules, etc.

During the period after the beginning of the European war very unusual and radical changes were effected in the relation of employer and employees, due to the unusual demand for production which emphasized the world's necessity for many articles, thus creating a great demand for labor. The abnormal manufacturing conditions referred to in the foregoing gave labor a most unusual opportunity to ask that consideration be given to working conditions, wages, and at least a suggestive voice in determining working conditions. This situation has developed so far that undoubtedly both employer and employees have an entirely different viewpoint and the fundamentals on which employment relations shall be reconstructed must be sound and very different from anything before attempted.

It is not contemplated that the Industrial Relations Committee will undertake work of a paternalistic nature, but rather educational and cooperative activities, and it has been suggested that a general committee be formed from the representatives of firm members who are engaged in the handling of industrial problems for their companies, to consist of not more than twenty-five members who are to be chosen with due regard to the geographical relationship of the various centers of the rubber industry. From this general committee, an executive committee of ten members is to be selected to carry the burden of performing the greater part of the work connected with the activities of an industrial relations organization. The organization of these committees is being effected and it is expected that they will soon begin to function.

ANNUAL MEETING.

A call has been issued for the annual meeting of The Rubber Association at 2:30 p. m., Monday, January 5, at the Waldorf-Astoria, New York City.

THE BANQUET.

The twentieth annual dinner will be held in the grand ball room of the Waldorf-Astoria, New York City, at 7 p. m., January 5, 1920. Tickets will be eight dollars.

Arrangements have been made for seating guests at round tables accommodating parties of ten persons. Members desiring entire tables, or those who wish to sit together but do not require an entire table, will kindly state their wishes when ordering tickets. Tickets are sold only to members or to those in their employ. There is no limitation to the number which each member may purchase.

The Banquet Committee has been particularly fortunate in having secured, as speakers, Charles M. Schwab, of the Bethlehem Steel Corporation, and Lieutenant-General Robert L. Bullard, Commander of the Eastern Department, United States Army, and an interesting evening is thereby assured. The name of a third speaker will be announced later.

NOMINATIONS FOR DIRECTORS.

The Nominating Committee, consisting of Messrs. Bertram G. Work, George B. Hodgman, Harvey S. Firestone, Frederic C. Hood and Henry C. Pearson, have suggested for nomination for directors at the annual meeting of the Association for a period of three years from January, 1920, the names of the following gentlemen:

W. O. Rutherford, vice-president, The B. F. Goodrich Co.
Homer E. Sawyer, vice-president, United States Rubber Co.
A. H. Brown, Meyer & Brown, Inc.
J. S. Broughton, president, United & Globe Rubber Co.
J. A. Maguire, vice-president, The Portage Rubber Co.

SUGGESTED AMENDMENTS TO CONSTITUTION AND BY-LAWS OF THE RUBBER ASSOCIATION.

The Rubber Association has disseminated to all firm members certain suggested amendments to the Constitution and By-Laws, which may be briefly stated as follows:

FIRST: The providing of more definite and specific conditions under which firms, corporations or individuals, not directly engaged in the rubber industry may participate in the activities of The Rubber Association of America, Inc. The suggested amendments include certain limitation of voting power and different annual membership dues. They also provide that those firms, corporations or individuals not directly engaged in the rubber industry, which are now members of the Association, shall automatically upon the adoption of the suggested amendments become affiliated members.

SECOND: Specific provision to the effect that membership in The Rubber Association is not transferable from one firm, corporation or individual to another under any conditions.

THIRD: Provision to make membership in the Association effective as for the calendar year instead of, as for a year from the first of the month following date of election.

WORK OF NATIONAL INDUSTRIAL CONFERENCE BOARD.

The Board of Directors of The Rubber Association has directed the attention of members to the work of the National Industrial Conference Board, particularly in connection with the vital industrial problems of the day, including the participation by the Board in the Industrial Conference, held recently in Washington.

The Association is distributing to its membership three of the recent important and interesting publications of the Board, entitled "Works Councils in the United States," "Statement of Principles Which Should Govern the Employment Relation in Industry," and the "Vital Issues in the Industrial Conference at Washington."

The first, "Works Councils in the United States," is a report embodying the results of a comprehensive study of works councils in 225 American industrial establishments, with considerable detail as to the various types of works councils and important facts as to their organization, constitution and methods of procedure.

The "Statement of Principles" is that which was submitted by the Employer Group to the Industrial Conference at Washington, D. C., October 10, 1919.

The "Vital Issues in the Industrial Conference" is an accurate and concise report respecting the principal subject of discussion in the Industrial Conference and is based on the official record of the proceedings of the Conference.

The Rubber Association, as a member of the Board, is contributing a substantial sum in quarterly payments, and it is understood that individual members of this Association are also making substantial contributions to the Board. Further, it is believed that a more intimate knowledge of the work, which may be gained by a careful study of the publications referred to, will bring a full realization of the necessity of continuing this important work and will, perhaps, result in the conclusion by individual companies that it is almost a duty to insure its permanence by assuming at least a small portion of the financial work.

STANDARDIZING CHECKS, VOUCHERS AND INVOICES.

THE STANDARDIZATION COMMITTEE of the National Association of Purchasing Agents in concluding its year's research on the standardization of invoices and related documents decided to submit tentative standards for invoices in order to draw constructive criticisms from those who may have occasion to use invoices. As soon as these criticisms are received it will be more readily possible to arrive at definite conclusions as to purchase orders and other documents which relate to invoices.

STANDARDIZED CHECKS AND VOUCHERS.

The Committee considered and approved the idea of standardizing checks and vouchers, which has already gained considerable

impetus, having previously had the approval of the Federal Reserve Board, the standard check being $3\frac{1}{2}$ by $8\frac{1}{2}$ inches, the standard voucher being just double that size, or 7 by $8\frac{1}{2}$ inches.

TENTATIVE INVOICE STANDARD.

In view of the fact that thousands of business houses file copies of invoices with the copies of vouchers, it was decided to make $8\frac{1}{2}$ by 7 inches the first tentative standard size for invoices, permitting the printing to be run either way of the sheet. In order to accommodate longer invoices two other sizes were provided for, also those who wish to file these invoices with copies of the vouchers may do so by folding the sheet backwards; that is, with the printing out. This permits the filing of invoices in standard filing cabinets already on the market.

A few years ago when the Standardization Committee adopted a tentative catalog size a great deal of constructive criticism resulted, and a year later a National Conference was held, at which the final size was settled upon; namely: $7\frac{1}{2}$ by $10\frac{1}{2}$ inches or its half size, $5\frac{1}{4}$ by $7\frac{1}{4}$, saddle stitched, so that it may be opened up flat for filing. It is hoped that similar constructive criticism may result now and that during the year it may be possible either to adopt these three sizes permanently or to select some other size as their substitute.

The committee desires to receive criticisms particularly from those who find these three sizes are not suitable for their requirements.

TENTATIVE STANDARD FORM ADOPTED.

The Committee also adopted in a tentative way a form for the invoice which will permit the vendor to record information which he should supply and provide certain standard spaces for the approval of various officials in the offices of the purchaser, and leaves three blank spaces, one on top for the name and address of vendor, on which may be written the name of the purchaser.

The body of the invoice is left blank for description of merchandise, prices, etc. The blank space on the bottom is left for rubber stamps of the purchasing departments to cover such notations as are not embraced in the printed form.

To guard against the possible duplication of payment of invoices, it was decided that the original and the original only was to be on white paper, all copies of invoices to be on colored paper. It was also decided to recommend tentatively the use of either 16 or 13-pound paper.

LOCATING THE INDEX IN CATALOGS.

The question of locating the index in catalogs was also taken up. The following quotation from the report of the Standardization Committee explains the attitude of the organization:

Much confusion now exists in connection with the placing of the index in bound catalogs. Some place it in the front of the book, others in the back, while still others place it in the center. There are arguments in favor of each place, but in view of the custom which has been so long common, whereby a much larger percentage of catalog manufacturers place the index in the back of the book, the committee feels that this should be made a standard practice.

FILING OF CATALOGS.

The following extract from the report of the Standardization Committee may interest those who are responsible for the filing of catalogs:

Committee recommends that catalogs be filed numerically according to size, catalogs to be indexed on individual cards for each vendor, vendors' cards to be filed alphabetically. Where vendors issue several catalogs on different lines of goods, index card to furnish clue to the goods contained in each catalog.

Committee also recommends that catalogs of book type be filed on shelves. Pamphlets or booklets may be filed either on shelves or in vertical file drawers.

If filed on shelves, gummed stickers should be applied to the back edges, projecting about 1/4-inch and numbered on the projections, the tabs to be staggered so that the numbers on each may be readily seen. If filed in drawers, drawers of legal, letter, bill, or document size may be used.

The Standardization Committee for the past year was composed of W. L. Chandler, Dodge Sales & Engineering Co., Mishawaka, Indiana, chairman; W. V. C. Bulkeley, Liberty Steel Products Co., New York City, New York; H. H. Meehan, A. B. Dick Co., Chicago, Illinois; A. Lockwood, Lumen Bearing Co., Buffalo, New York; F. L. Kulow, Willard Storage Battery Co., Cleveland, Ohio.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

(759.) A reader desires the address of the manufacturer of Underwood retreading molds.

(760.) An inquiry has been received as to what concerns manufacture a tarred paper bag 10 by 15 inches, for holding inner tubes.

(761.) A manufacturer requests the addresses of makers of squawker ends and valves for toy balloons.

(762.) An inquiry has been received for the addresses of manufacturers of pool and billiard cushions of rubber.

(763.) A manufacturer requests the address of the manufacturer of Dodd's cross expansion sometimes known as "Skookum" packing.

(764.) A subscriber desires the addresses of manufacturers of rubberized fabrics in large quantities for tires, sheeting, belting, boots and shoes, mechanical goods, rubber pillows, etc.

(765.) Inquiry is made for the address of the manufacturer of pneumatic telephone receiver cushions.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

Addresses may be obtained from the Bureau of Foreign and Domestic Commerce, Washington, D. C., or from the following district or cooperative offices. Request for each address should be on a separate sheet, and state number.

DISTRICT OFFICES.

New York: 734 Customhouse.
Boston: 1801 Customhouse.
Chicago: 564 Federal Building.
St. Louis: 402 Third National Bank Building.
New Orleans: 1020 Hibernia Bank Building.
San Francisco: 307 Customhouse.
Seattle: 848 Henry Building.

COOPERATIVE OFFICES.

Cleveland: Chamber of Commerce.
Cincinnati: Chamber of Commerce.
General Freight Agent, Southern Railway, 96 Ingalls Building.
Los Angeles: Chamber of Commerce.
Philadelphia: Chamber of Commerce.
Portland, Oregon: Chamber of Commerce.
Dayton, Ohio: Dayton Chamber of Commerce.

(31,143.) A commercial agent in France desires agency for the sale of bicycles, automobiles, tires, etc. Correspondence in French.

(31,165.) A man in Belgium wishes to purchase and to have consigned to him rubber goods and articles in celluloid. Correspondence may be in English. Reference.

(31,169.) A merchant in Belgium desires the agency for the sale of manufactured rubber articles. Correspondence and catalogs in French.

(31,186.) A man in France desires an agency for the sale of shoes, hosiery and rubberized fabrics. Correspondence in French.

(31,191.) Commercial agent in Belgium wishes agency for articles connected with heating installation, including joints in asbestos and rubber. Quotations should be c. i. f. Brussels or Antwerp. Correspondence may be in Spanish.

(31,194.) Agencies desired by a firm in France for the sale of textiles and rubber goods. Correspondence in French.

(31,200.) A Rumanian firm, established in England, wishes to buy outright, for sale in England, rubber boots and shoes; for sale in Rumania, boots and shoes of all kinds on consignment against guaranties. Quotations should be c. i. f. English port and Braila, Rumania. Payment in 30 days, English currency, through bank. Correspondence may be in English.

(31,207.) A company in Greece wishes to secure agency for insulated electric cables and wire. Correspondence in French.

(31,231.) Representative of a firm in France desires to secure agency for the sale of rubber goods.

(31,246.) Director of an agency firm in Spain wishes agencies for the sale of crude rubber, rubber goods and tires. Correspondence in Spanish or French.

(31,267.) Importer in England desires agencies for the sale of American manufacturers' goods. Has handled tires. Quotations c. i. f. European ports.

(31,269.) A firm in Spain seeks agencies for the sale of rubber goods, sanitary and medical material, rubber and glass goods for orthopedists, combs, fountain pens. Correspondence in Spanish.

(31,298.) A man in Brazil wants an agency for the sale of rubber tires and all kinds of mechanical rubber goods.

(31,316.) A firm in Canada wishes the sole agency for rubber boots, coats, trousers, hats and all supplies for fishing fleet. Cash on first order.

(31,345.) A manufacturer in Spain wishes to secure an agency for the sale of insulated and enameled copper wire on bobbins and resistance wires. Correspondence in Spanish.

(31,354.) Representative in United States of an importer in Italy wishes exclusive agency for the sale of rubber goods.

(31,399.) A company in Spain wishes to secure an agency for the sale of crude rubber, chemicals, insulators. Correspondence in Spanish or French.

THE HOUSE OF BIRKENSTEIN TO SELL CRUDE RUBBER.

S. Birkenstein & Sons, Inc., of Chicago, New York, Philadelphia and Minneapolis, one of the oldest and most important rubber firms dealing in scrap rubber in the United States, now over a half century in existence, is entering upon the business of handling plantation rubber as well. The head of the company, Louis Birkenstein, who for five years was president of the Waste Material Dealers' Association, has been serving for over a year at the head of the Salvage Department of the Quartermaster-General's office.

A NEW SOURCE OF ASBESTOS.

A great deposit of asbestos in the district of Gaspé, near Port Daniel at the mouth of Chaleurs Bay, which lies between New Brunswick and Quebec, is about to be developed by a Montreal company. The deposit is of low-grade asbestos, the best being of No. 2 crude quality, but there are 2,000,000 tons in sight, the outcroppings of a mountainside, easy to work. Within a short distance are the necessary water-power and raw materials needed to work the asbestos into cement, brick, and other products. A mill with a daily output of 63 tons is being installed.

RUBRAX.

Rubrax is a high melting point asphaltum product intended for mixing with all grades of crude and reclaimed rubbers as a filler, preservative and substitute.

News of the American Rubber Industry.

FINANCIAL NOTES.

THE MASON TIRE & RUBBER CO., Kent, Ohio, has increased its capital stock to \$7,500,000, having begun with an initial allotment of only \$250,000 four years ago.

The net profits of The B. F. Goodrich Co., Akron, Ohio, for the six months ended June 30, 1919, before deducting Federal taxes, were \$7,700,000; at the rate they have been going since, it is probable that they will exceed \$8,700,000 for the last six months, making a total for the year of \$16,400,000, the greatest in the history of the company. After deducting preferred dividends, the balance available for the \$60,000,000 common stock would be \$24 a share. The company has increased its capital from \$27,000,000 at the end of December, 1915, to \$43,500,000 at the end of 1918, and may increase the common dividend rate. In four years the Goodrich company has actually added to its common stock a value of \$70 a share.

It seems likely that the sales of The Goodyear Tire & Rubber Co., Akron, Ohio, for 1920 will exceed \$300,000,000. The sales for the fiscal year ended October 31, 1919, made a total of \$167,315,000, those for October alone being the highest in the company's history, \$20,000,000. The year's sales in 1915-16 were less than \$64,000,000; in 1910-11 they were only a little over \$13,000,000, and in 1907-08 they were just over \$2,000,000. The company's business has increased a hundred-fold in twelve years. The stockholders of the Goodyear company have approved the increase of \$100,000,000 in capitalization, bringing the total authorized capital to \$200,000,000.

The directors of Lee Rubber & Tire Corp., Conshohocken, Pennsylvania, have decided to increase the capital from 100,000 shares to 150,000 shares. Of the 50,000 new shares, 40,000 are offered first to stockholders at \$33 a share; the other 10,000 will be offered to employees on a profit-sharing plan. The sale of the additional shares will give the company \$1,200,000 with which to expand its business and it is expected that the output by next spring will be 4,000 tires a day.

The statement of the corporation for the eight months ended August 31, 1919, shows net profits of \$396,375, before deducting Federal taxes. Net sales amounted to \$3,345,067; the cost of goods sold to \$2,956,541, and the operating profit was \$1,388,526.

The Boston Woven Hose & Rubber Co., Cambridge, Massachusetts, has filed with the Massachusetts Secretary of State a statement of its financial condition, dated August 31, 1919, which we compare with that for 1918.

	ASSETS.	1919.	1918.

Floating debt			1,552,000
Surplus		2,030,383	1,932,196
Total		7,340,409	7,607,394

The Hodgman Rubber Co., Tuckahoe, New York, has increased its capital stock by the authorization of \$1,000,000 eight per cent preferred stock, \$100 par value, and 50,000 shares of common stock of no par value. Of the new preferred stock \$197,500 is to provide for the retirement of an equal amount of the old preferred, and the balance has been sold. Of the common stock there are 12,100 shares now outstanding.

EXPLAINING STOCK OF NO PAR VALUE.

It is a common practice of corporations to show at the head of the liability side of their balance sheets the full par value of

their capital stock issues outstanding. The stockholder has no means of telling how much of this amount represents paid-in value. For this reason it is becoming a common practice at the present time to issue stocks of no par value. While for balance sheet purposes a value must be placed on the shares, the public is not misled by this to the same extent as it would be by the old practice of putting in the par value.

A few investors seem to be mystified by the new practice, however, and for the benefit of these it may be stated that the value of a share of stock with no par value, may be readily estimated by dividing the profit and loss surplus by the number of shares outstanding, adding to the surplus, of course, any value which may be set against capital stock. ("The Magazine of Wall Street.")

DIVIDENDS.

The Ajax Rubber Co., Inc., New York City, has declared its quarterly dividend of one and one-half per cent, payable December 15 on stock of record November 29, 1919.

The Archer Tire & Rubber Co., Minneapolis, Minnesota, at a meeting of its directors held October 25, 1919, resolved to put its stock on a six per cent cash dividend basis beginning January 15, 1920.

The Boston Woven Hose & Rubber Co., Cambridge, Massachusetts, has declared its regular semi-annual dividend of three per cent on its preferred stock and its regular quarterly dividend of \$3 per share on its common stock, both payable December 15, 1919.

The Fisk Rubber Co., Chicopee Falls, Massachusetts, has declared its regular quarterly dividend of one and three-quarters per cent, payable December 15 on its second preferred stock of record December 1, 1919.

The General Electric Co., Schenectady, New York, has declared a cash dividend of \$2 per share, and a stock dividend of two per cent, both payable January 15, 1920, on stock of record December 6, 1919.

The B. F. Goodrich Co., Akron, Ohio, has declared its regular quarterly dividend of \$1.75 per share, payable January 1, 1920, on preferred stock of record December 21, 1919.

The Kelly-Springfield Tire Co., New York City, has declared its quarterly dividend of \$1.50 per share, payable January 2, 1920, on six per cent preferred stock of record December 15, 1919.

The New Jersey Zinc Co., New York City, has declared an extra dividend of two per cent, payable December 10 on stock of record November 29, 1919.

The board of directors of the Overland Tire Co., Newark, New Jersey, recently voted to pay dividends quarterly hereafter instead of monthly. Action on the next dividend will be taken late in December.

The Pennsylvania Rubber Co., Jeannette, Pennsylvania, has declared its regular quarterly dividends of one and three-quarters per cent on preferred stock and one and one-half per cent on common stock, payable December 30 on stock of record December 15, 1919.

The Plymouth Rubber Co., Canton, Massachusetts, has declared its regular quarterly dividend of one and three-quarters per cent, payable December 1 on preferred stock.

THE ROBERTSON PROCESS METAL IS A PREPARATION THAT DOES NOT RUST and that resists the action of gases and weather conditions. It is a steel sheet protected first by a coating of asphalt on which asbestos is laid and over that a heavy waterproofing covering. It is turned out in various shapes and is used for roofing and siding.

NEW JERSEY ZINC CO.'S RUBBER CHEMIST.

HARLAN A. DEFEW, who has recently associated himself with the research division of the New Jersey Zinc Co., at Palmerton, Pennsylvania, is peculiarly well fitted to fill the position. Having graduated from the Chemical Engineering Department of the University of Michigan in 1913, and after teaching general chemistry for a year, and taking a year of post-graduate work, he received the degree of M. S. in physical chemistry in 1914. The next year he entered the Bureau of Mines at Pittsburgh, Pennsylvania, for research work in physical chemistry and two years later was sent to Seattle, Washington, as the chemist in the new metallurgical station then being opened there.

In January, 1918, he was transferred to the war gas investigation under the Bureau of Mines, at American University, Washington, D. C., becoming a second lieutenant, C. W. S., U. S. A., when the War Department took over the work, which office he filled until December 30, 1918. He then entered the employ of the Firestone Tire & Rubber Co., Akron, Ohio, as research physical chemist, working largely on problems of heat, such as heat distribution during vulcanization, and heat due to internal friction.

Entering upon his new duties with the New Jersey Zinc Co. in October, he is now engaged in experimental work on rubber compounds and studying the properties produced by the different pigments in these compounds.

HARLAN A. DEFEW.

PERSONAL MENTION.

J. P. Davis, purchasing agent of the Belden Manufacturing Co., Chicago, Illinois, has been elected president of the Purchasing Agents' Association, Chicago. Special importance attaches to this position at this time, since the convention of the National Association of Purchasing Agents is to be held in Chicago in 1920. Mr. Davis was formerly assistant purchasing agent for the Standard Underground Cable Co., Pittsburgh, Pennsylvania, and has been with the Belden company since 1916.

William F. Hart, who recently resigned as sales manager of the Rubber Insulated Metals Corp., Plainfield, New Jersey, has been appointed sales manager of the Needham Tire & Rubber Co. of New York, Inc., 1695 Broadway, New York City.

Harold O. Smith, formerly president of the J. & D. Tire Co., Charlotte, North Carolina, has become associated with the Ajax Rubber Co., Inc., 218 West 57th street, New York City, in charge of the company's activities pertaining to housing and general welfare work.

The estate of the late Frank Cazenove Jones, whose obituary was published in THE INDIA RUBBER WORLD, October 1, 1918, has been appraised as follows: Total estate, \$117,445; cash, \$14,477; personal, \$3,724; stocks and bonds, \$99,244. His widow, Anna M. Jones, receives \$51,220; his son, Frank C. Jones, \$17,468, and his two daughters, Pauline C. Chittenden and Florence C. Doughten, \$16,554 each.

L. M. Bergin, managing director of the Dunlop Rubber Co., Limited, of Great Britain; Sir Harry McGowan, one of the influential directors; Captain George du Cros, manager of the works at Birmingham, and other leading men in the company,

are now visiting the United States with the object of establishing a Dunlop company in America, with a \$50,000,000 capital, as the chairman of the British company, A. L. Ormrod, announced at the extraordinary meeting held on December 1, 1919.

H. Cassel has been appointed manager of the New York City branch of The Portage Rubber Co., Akron and Barborton, Ohio, succeeding George H. Kiley, resigned.

Averill Tilden has been elected to succeed H. L. McClaren as a director of the Ajax Rubber Co., Inc., 220 West 57th street, New York City.

WESTINGHOUSE ALLIANCE FOR WORLD WIDE TRADE.

On his return from Europe late in October, General Guy E. Tripp, chairman of the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, announced the completion of arrangements by which a business alliance has been formed between that company and the Metropolitan-Vickers Electric Co., Limited, the purpose of which is to expand the business of the two companies throughout the world. One feature of this arrangement was the payment by the British company of between \$5,000,000 and \$7,000,000 to the Westinghouse company.

The Westinghouse Electric and Manufacturing Co. has taken over the plant of the New England Westinghouse Co. at Springfield, Massachusetts, and will soon have about 5,000 men at work there, manufacturing industrial motors and lighting outfits, supplementing the work at the East Pittsburgh, Pennsylvania, plant. The company has sold the drop-forging plant at Chicopee Falls, Massachusetts, which it operated as the Page-Storms Drop Forge Co., it not being adapted to the post-war needs of the company. The J. Stevens Arms Co., another Westinghouse enterprise, where rifles were made for the Russian Government, is now turning out sporting rifles, and enjoying the heaviest business in its history.

ROBERT ALLAN RETURNS TO BRAZIL.

Robert Allan, who was for many years manager of the London & Brazilian Bank at Pará, Brazil, and a well-known and popular figure in financial and rubber circles of that city, has accepted a position with the Mercantile Bank of the Americas, and sailed for Brazil last month.

Mr. Allan enlisted in the 2nd Battalion Scots Guards in December, 1917, and was severely wounded in the engagement in front of Arras. After six months in the hospital he was discharged five days after the armistice was signed.

PLANNED A SOUTH AMERICAN RAILROAD.

Señor Enrique Coronel Zegarra, for more than twenty years connected with the project of building with American capital the Paita-Maranon railroad, to connect the Amazon river with the Pacific, died recently at Lima, Peru. The proposed railroad was planned as a link in a system of transcontinental transportation, crossing the Andes from Paita on the Pacific to the upper waters of the Marañon river, which is navigable from the base of the Andes to the Amazon of which it is one of the great tributaries. President Leguia of Peru declared in his inaugural address on October 12 that the negotiations for the construction of the railway were well advanced and that it would open up a region capable of supporting a population of twenty-five million people. Señor Zegarra was formerly a member of the Peruvian Cabinet.

THE NUMBER OF AUTOMOBILE TIRES IMPORTED INTO JAVA AND Madura during the month of August, 1919, was 18,277 as compared with 14,317 during the month of August, 1918.

From January to August, 1918 and 1919, the imports of this commodity into Java and Madura amounted to 70,708 and 149,569, respectively.

THE NEW YORK AUTOMOBILE SHOWS.

An exhibition of the very latest advance in automobiles, their parts and accessories, both for pleasure and for commercial purposes, will appeal to the wide-awake public as few things can. There will be really two exhibitions at the same time in New York City, that of automobiles at the Grand Central Palace, and that of motor trucks at the Eighth Coast Artillery armory. They will be held on the same days, from January 3 to January 10 inclusive, enabling the general public and the technical experts to visit both during their stay in the city, and to see with their own eyes the countless improvements and inventions which have been stimulated by the needs arising out of the war.

M. & A. M. A. APPOINTS FIELD SECRETARY.

The Motor & Accessory Manufacturers' Association, having found it advisable to appoint a field secretary, announces that Alexander W. Barber has been selected for that important position. By training and experience he is well equipped for this work, having been connected with the credit department of the Irving National Bank, New York City, and previous to that was a member of the inspection department of the New York Life Insurance Co.

In his new position he will travel about the country, keeping in touch with the credit managers' and other executives of the various companies of the Association, which now numbers more than 360 members.

THE RUBBER TRADE ASSOCIATION OF NEW YORK ELECTS OFFICERS AND DIRECTORS.

The following officers and directors of The Rubber Trade Association of New York were elected at the annual meeting, held November 6, 1919.

OFFICERS—1919-20.

William T. Baird, president; F. R. Henderson, vice-president; H. W. French, treasurer; A. W. Stedman, secretary.

DIRECTORS.

William T. Baird, Rubber Trading Co.; W. E. Bruyn, L. Littlejohn & Co., Inc.; H. W. Holcombe, Rubber Importers & Dealers' Co., Inc.; H. W. French, Gove & French, Inc.; F. R. Henderson, F. R. Henderson & Co.; Samuel Kubie, Raw Products Co.; Edward Maurer, Edward Maurer Co., Inc.; Frank Poel, Poel & Kelly; A. W. Stedman, Arthur W. Stedman, Inc.; William H. Stiles, William H. Stiles & Co.; C. T. Wilson, C. T. Wilson Co., Inc.

MINNEAPOLIS TRUCK TERMINAL A SUCCESS.

The "ship by truck" movement in Minneapolis appears to have become a permanent institution. After little more than one month's operation the Minneapolis Truck Terminal has had to double its floor space to take care of increasing business. Located in the heart of the wholesale district, this terminal is affording a central depot to ten motor express companies whose routes extend in all directions within a radius of 100 miles. It is the point from which incoming loads are distributed throughout the city, and at which outgoing loads are assembled.

Trucks are carrying into the city great quantities of farm produce, much of which would otherwise go to waste, and are taking back to the farmer furniture, machinery, groceries and other necessities of life. Wholesalers and merchants are lending hearty support. They deliver goods for the outlying districts at the terminal, where it is sorted and distributed to the rural express operators. It means only a city delivery for the wholesaler, while express operators find that the small charge made by the terminal company represents a large saving to them over what it would cost to run their heavy trucks over the city streets in making pick ups.

The terminal company is at present making a flat rate of five cents per hundred weight for its service, which includes of taining new business for truck line operators, making collections and taking care of bookkeeping. Drivers are instructed to take orders from rural merchants for anything needed from wholesalers. These orders are turned in to the terminal company, and by it sent to the wholesale houses. The prevailing rates for shipments by truck are little more than the rates by freight for corresponding classifications. Taking into consideration the fact that by truck several handlings of each shipment are eliminated, that boxing or crating is not necessary, and that from two to seven days' time is saved in delivery, it is no wonder that shippers are enthusiastically supporting the "ship by truck" movement. Certainty of delivery and elimination of damage to goods in transit are other considerations that are rapidly gaining friends for the motor truck in the short haul field.

Tire and truck manufacturers, merchants, farmers and express companies have been following this venture with great interest, and its complete success forecasts the early establishment of other similar services elsewhere with profit to all concerned. Certainly extensive express trucking means greatly increased tire consumption.

HEWITT BASEBALL TEAM WINS BUFFALO CHAMPIONSHIP.

The Hewitt Rubber Co., Buffalo, New York, boasts of the prowess of its baseball team which won the championship of the Washington League of the Buffalo Municipal Baseball Association, in October, winning 16 out of the last 18 games in

**THE HEWITT BASEBALL CHAMPIONS.**

which it played. This victory was celebrated by a banquet given by President and Mrs. Hewitt at the Iroquois Hotel.

This victory gave the club the privilege of playing off the champions of the rival league. Two games were required, both of which were won by the Hewitts, thus making them the champions of Buffalo, and this victory was duly celebrated, closing with the presentation of a handsome watch to the manager of the club, Arthur L. Schwartz.

The club disbanded for the season, proud of its record and of the trophy and individual prizes presented at a special vaudeville entertainment given November 5. Meanwhile the bowling team and basket-ball teams of the Hewitt company are progressing well for the championship of their respective sports.

THE B. F. GOODRICH CO.'S TIRE ADJUSTMENT POLICY NOT ONLY insures the user of Goodrich pneumatic tires against imperfect tires but clearly specifies a definite number of miles he may expect as a minimum under proper usage, namely, 6,000 miles on fabric and 8,000 miles on cord tires.

THE RUBBER TRADE IN OHIO.

By Our Regular Correspondent.
FIRESTONE'S LATEST ADDITION.

GROUND was broken about October 1 for a new mechanical building for the Firestone Tire & Rubber Co., Akron, which, as shown by the illustration, will be a thoroughly modern, up-to-date structure, 325 feet long by 315 feet wide, and costing \$400,000.

The front section is three stories high and 25 feet deep, to contain offices, locker rooms, wash rooms, shower baths, lunch room, and cafeteria. Just behind, two bays, each forty-five feet deep, with headroom under the trusses of thirty feet, are equipped with two ten-ton traveling electric cranes. The remainder of the buildings will consist of eight bays, each twenty-five feet wide, with a height of fifteen feet under the trusses. At the southwest corner is planned a forge shop 50 by 100 feet, and along the south side of the main building a storage and loading platform eighty feet long will be built.

The roof is of sawtooth construction with a northern exposure that does away with shadows. Ample ventilation, both natural and artificial, is supplied, since part of the heating system can be used to give plenty of cool air, and can be operated in the summer as a ventilating system to keep the air in constant circulation. The floor will be of wooden blocks laid on reinforced concrete, a combination which, besides being best adapted to the requirements of a building intended for mechanical purposes, is also easiest on the feet.

The equipment is to be in keeping with the modernness of the building. The machinery will be actuated by individual electric motors. This addition will be occupied by the electrical, machine, pipe, carpenter and tin shops, and almost 500 hands will be employed there. It is intended to be completed, equipped, and occupied early in the new year.

NEW FIRESTONE RIM PLANT.

Ground was broken in October at Akron for an additional \$1,000,000 plant in the group of Firestone factories. The new plant will house the Firestone Steel Products Co., which annually produces approximately 1,500,000 demountable rims for pneumatic automobile tires and 65 per cent of the steel bases used in the United States for solid truck tires.

The Firestone Steel Products Co., at present occupies the group of buildings which until 1910 housed the entire manufacturing facilities of the Firestone company. This group which was then too small to meet the demands for Firestone tires, is now too small to meet the demands for Firestone rims.

Firestone rims were first manufactured in Cleveland, they were of the demountable type and were soon adopted by many motor car manufacturers.

By 1910 large sizes of solid tires were coming into use and

there was need of steel bases for them. As the demand promised to grow steadily, Mr. Firestone installed a welding plant as a department of the Firestone Tire & Rubber Co., where they were fashioned. Shortly afterward he decided that the company should turn out its own rims for pneumatic tires and enlarged the welding plant for the purpose.

In 1916 the demand for rims passed the 1,000,000 mark, and by May, 1918, the business had grown to such proportions that Mr. Firestone decided to form a separate company to produce rims and steel bases. The Firestone Steel Products Co. was the outcome.

The main building of the new plant will be 860 by 250 feet. Advantage will be taken of every opportunity to give the workers light and ventilation. The machinery throughout will be of the most improved type. Immediately in front of the main building will be a two-story office building, 170 by 40 feet.

It will be connected with the main building by covered bridges. A cafeteria for the entire factory force will be housed in the basement of the same building.

AKRON NOTES.

The Mohawk Rubber Co., Akron, will place on the market a line of special pneumatic truck tires as soon as its additions to plant buildings and equipment are completed. Some sizes are already being manufactured.

On November 16, The B. F. Goodrich Co., Akron, through

its recreational department began the presentation of a program of motion pictures in the recreation hall for Goodrich employees and their families.

The Goodyear Tire & Rubber Co. has instituted a new system, whereby it will assist its employees in starting and carrying bank and savings accounts, by attending to the details of depositing each week, in any bank, trust or loan company designated by its workers, such proportion of the weekly pay as each one may wish to lay aside, and placing in the pay envelope a receipt showing that the deposit has been made. The banks open a regular account, for each depositor, with a pass book in which each payment is credited.

This system is one which must commend itself to many thrifty and frugal

workers who by this method are relieved of the necessity of going each week to make their deposits, and by which they are committed to a systematic savings plan, or to feel assured of regular payments of assessments in their building and loan associations. The system is one which might well be adopted by other large industrial establishments.

Among the organizations of The Goodyear Tire & Rubber Co.'s employees at Akron, Ohio, the "silent" base ball team, made up entirely of deaf mutes is noteworthy and is now well known throughout northeastern Ohio. Last season the team had a record of twelve victories out of sixteen games, a percentage

MECHANICAL GOODS PLANT OF THE FIRESTONE TIRE & RUBBER CO.

NEW PLANT OF THE FIRESTONE STEEL PRODUCTS CO., AKRON, OHIO.

of 75, which shows that talk is not essential to baseball, as all the teams they met and defeated were other than mutes, and some of them were strong teams. The team has a large following among the other deaf mutes, silent fans who encourage them by rooting from the bleachers in the sign language. With the end of the baseball season the "silent" team has turned itself into a football team.

GOODYEAR'S SILENT BASEBALL TEAM

The Goodyear Tire & Rubber Co., Akron, has started a class in law in the factory school, under capable tutors.

The Goodyear Tire & Rubber Co., Akron, will build a \$200,000 dormitory for girls in its employ to accommodate 175. It will be of brick, three stories high, situated in the Goodyear Heights community. The management will be in the social service department, under Miss Clara E. Bingham, and the project will be operated on a cost basis.

L. C. Rockhill, recently appointed sales manager of The Good-

L. C. ROCKHILL.

year Tire & Rubber Co., has been connected with the company for over 12 years, previous to which time he was in the advertising department of a Cleveland newspaper. His first service with Goodyear was in charge of the repair department, and he was successively made manager of the aeronautical department, manager of the automobile tire department and assistant sales manager in charge of tire sales. His promotion to his new position is a deserved recognition of his ability and his long experience in selling.

D. E. Day has been appointed manager of footwear sales for the Firestone Tire & Rubber Co., Akron. Previous to coming to the Firestone company last February, as credit man for the footwear department, he was for eight years credit man for the Mishawaka Woolen Manufacturing Co., Mishawaka, Indiana.

The B. & W. Rubber Co. is now installing machinery in its factory at Homes and Talmadge avenues, Akron, and will start manufacturing by the middle of December. The company will produce a high grade of reclaimed rubber, and will manufacture a line of mechanical goods. The officers of the company are: H. A. Backderf, president; D. M. Bauer, vice-president; George W. Payne, secretary; G. J. Carter, treasurer, and L. Bognar, purchasing agent.

MISCELLANEOUS OHIO NOTES.

The tire salesmen of the Rubber Products Co. held their annual convention at the factory at Barberton, Ohio, October 30, spending three days in discussing plans for the campaign of 1920, when the output of the factory will be doubled. One evening the company entertained the visitors, together with all

the factory superintendents and foremen, at the Akron City Club, and the next evening a dinner was held at Smith's Hotel, Long Lake, one of the many lake hotel resorts near Akron. At the business and social sessions much enthusiasm was evident, and the salesmen claimed that the company would be compelled to triple its present output.

The Pearce Tire & Rubber Co., Ashtabula, Ohio, has leased its plant to The Colonial Tire & Rubber Co., Anderson, Indiana, for a period of five years, and is winding up its affairs, the Colonial company having acquired control of the plant.

The Gordon Tire & Rubber Co., Canton, Ohio, has promoted to the position of sales manager its eastern special sales representative, M. S. Lines, succeeding A. W. Senz, who recently resigned. Mr. Lines was connected for seven years with the sales department of the Michelin Tire Co., Milltown, New Jersey, previous to coming to the Gordon company.

The L. & M. Rubber Co., Carrollton, Ohio, has appointed A. W. Senz its general sales manager. Mr. Senz has been with The Gordon Tire & Rubber Co., Canton, Ohio, for the last five years.

The Buckeye Rubber Products Co., National City Building, Cleveland, incorporated under Ohio laws, has acquired the plant at Willoughby, Ohio, recently used by the War Department for the development of poison gas. The main building, approximately 150 by 600 feet, will be equipped and operated for the manufacture of heavy mechanical rubber goods, under the direction of Edwin L. Stimpson, factory manager, recently superintendent of the Mechanical Rubber Co., Cleveland, assisted by Webster Norris as consulting technologist. The officers of the company are: Charles H. Roth, president and general manager; Webster Norris, vice-president and consulting technologist; James M. Mackay, treasurer and sales manager; C. V. Goepfer, secretary.

The Excel Rubber Co., Wadsworth, Ohio, has increased its capital from \$100,000 to \$600,000. The officers of the company are: M. H. Leatherman, president; H. D. Mench, vice-president; R. M. Trump, secretary and treasurer. The directors include Charles Farr, E. J. Krabill, C. M. Wertz, F. G. Alderfer and John Manoly. The company will begin the manufacture of "Excel" tires on its own account about the first of March. It will also make a full line of accessories, such as reliners, blow-out patches, hook-on and lace-on boots, vulcanizing rubber and cement.

The National Tire & Rubber Co., East Palestine, Ohio, at its annual meeting elected the following officers: C. L. Merwin, president; S. L. Warner, vice-president and general manager; C. E. Miley, vice-president, in charge of sales; C. W. Helman, secretary, and R. B. Taggart, treasurer.

R. H. Sotherland, formerly purchasing agent of The Mansfield Tire & Rubber Co., Mansfield, Ohio, has resigned to identify himself with The Columbia Tire & Rubber Co., of the same place, to take effect December 1, 1919.

With headquarters at Cincinnati, L. L. Heidacher will serve the Firestone Tire & Rubber Co., Akron, as special representative in a territory extending from Sault Ste. Marie to Louisiana. He was formerly truck tire manager at the company's branch in Memphis, Tennessee.

The Glamorgan Tire and Rubber Corp., Orrville, Ohio, has increased its capital from \$250,000 to \$500,000. It was incorporated in October, 1918, under the laws of Delaware, to manufacture automobile and bicycle tires, inner tubes and accessories.

The McNaull Tire & Rubber Co., Toledo, has been incorporated under the laws of the State of Delaware to succeed to the business formerly conducted by the McNaull Tire Co. of the same city, the latter having gone into bankruptcy and been placed in

the hands of Frank Miller, attorney, as receiver. The new company will manufacture a high-grade cord and fabric pneumatic tire under the McNaull patents which it has acquired. The distinguishing feature of the McNaull tire is the construction of the arch.

The present plant will be immediately enlarged to increase production, and in addition to the necessary land on which to build, options on adjoining real estate have been secured. The officers of the new company are: W. D. McNaull, president; F. R. Wilhelm, vice-president and treasurer; C. S. Wachner, secretary; directors: W. T. C. Carpenter, F. S. Gordon, Edward H. Cady, William F. Ridge, A. R. Fraser, and the president and treasurer of the company.

Work on the new power plant of The Standard Tire Co. at Willoughby, Ohio, is progressing so well that it is expected that it will be in full operation by the first of January. Cord and fabric tires are being made.

THE NATIONAL TIRE & RUBBER CO.'S GENERAL MANAGER.

S. L. WARNER, vice-president and general manager of The National Tire & Rubber Co., East Palestine, Ohio, is a typical American who has risen to his present position by individual exertions and innate ability.

S. L. WARNER.

Born in Kent, Ohio, November 9, 1868, his early education in the public schools was interrupted by the necessity of earning his living. Choosing to become a printer, he learned that trade while working on newspapers in Kent, Ravenna and Cincinnati, and a printing house in Akron, meanwhile attending night school to learn bookkeeping and commercial principles.

Leaving the printing office, he accepted a position as bookkeeper for a local firm, and then a wholesale grocery concern in Akron, advancing until he had charge of the credit and collection department of the latter company, a position he relinquished to join the Diamond Rubber Co., Akron, first as correspondent and later in charge of the credits

and collections of the eastern half of the United States.

In 1911 he came to The McGraw Tire & Rubber Co., East Palestine, Ohio, as credit manager, later becoming office manager, superintendent of branches, Pacific coast manager and then assistant sales manager. When The National Tire & Rubber Co., East Palestine, Ohio, passed to the control of the same interests as those of The McGraw Tire & Rubber Co., Mr. Warren was made general manager, and later vice-president, both of which offices he now holds.

As a citizen of East Palestine, he is noted for his public spirit, being especially active in such movements as the Red Cross, War Service Union and civilian relief organizations. He is a Knight Templar, a Shriner and a 32nd-degree Mason.

A. L. PARDEE MANUFACTURERS' REPRESENTATIVE.

A. L. Pardee has resigned as purchasing agent of The B. F. Goodrich Co. to engage in business for himself as a manufacturers' representative, with offices at 512-513 Ohio Building, Akron, Ohio. He also expects to represent several other manufacturers of well known rubber specialty products.

A. L. PARDEE.

Mr. Pardee entered the employ of the Diamond Rubber Co. in 1894 and was rapidly advanced to the position of purchasing agent. At the time of the consolidation of the Goodrich and Diamond companies he assumed the same duties with the Goodrich company. During these years he has bought almost every commodity used in the rubber industry, not only raw materials but manufactured supplies as well. For many years, however, he has specialized on textiles as applied to the manufacture of rubber goods. Much of his time will be devoted to the interests of the Brighton Mills, of Passaic, New Jersey, tire fabric manufacturers, for whom he will be western representative.

NEW DEVELOPMENTS OF THE MASON TIRE AND RUBBER CO.

The \$2,000,000 cotton fabric mill, erected by The Mason Tire & Rubber Co., at Kent, Ohio, is the first tire fabric mill ever built in the Akron district, and marks the third expansion of the company in the three years since the original factory was built. The mill is constructed of concrete and steel and has 125,000 square feet of floor space. In it are embodied the most advanced ideas, both in design and equipment, known to tire fabric manufacturers. The first unit of 10,000 spindles will be

PLANT OF THE MASON TIRE AND RUBBER CO.

in operation in a few months, and four more such units will be provided as need requires.

The extension of the rubber plant will place the Mason company among the first five tire producers of the Akron district. Eighty thousand square feet of floor space will be devoted to rubber in the new buildings, which will give a producing capacity of about 2,300 tires, solid and pneumatic, a day. Extensions of the administrative and welfare buildings, garages and so on will be made this year, and the plans prepare for future additions in all departments. The housing of the large force of workers is also provided for, as 140 acres of land have been bought for improvement and a large number of houses have been built during the year. These are well constructed and modern and are rented or sold to employees on favorable terms.

MID-WESTERN NOTES.

By Our Regular Correspondent.

THE following appointments have been made by the Firestone Tire & Rubber Co., Akron, in the Middle West and West: L. A. Brown, special truck tire sales representative in the Northwest; C. W. Brown, office manager, St. Louis, Missouri; M. O. Halverstad, office manager, Des Moines, Iowa; A. W. Hugh, office manager, Fargo, North Dakota; George Jacoby, office manager, Great Falls, Montana; E. A. Snyder, office manager, Minot, North Dakota; H. J. Guther, special representative for truck tire sales, with headquarters at Chicago, Illinois; George W. Keller, special representative of the new cycle tire sales department, with headquarters at Chicago, territory to include, in addition to that city, Minneapolis, St. Paul and Duluth, Minnesota; Milwaukee, Wisconsin; Des Moines and Davenport, Iowa; Fargo and Minot, North Dakota; and Great Falls, Montana.

The Pan-American Rubber Co., now of Milwaukee, Wisconsin, manufacturer of the "Parco" cellular pneumatic inner tire, is building a factory on South First street, Watertown, Wisconsin, which is expected to be occupied by the first of January, on which date the company will remove its office to the new factory address. Its leading product is an inner tire filled with a substance similar to sponge rubber, and which, because of its construction, obviates the trouble of punctures and blowouts.

The Racine Rubber Co., Racine, Wisconsin, has bought 55 acres of land in the vicinity of its factory and subdivided it into lots on which it is now building houses for 200 families. These contain six rooms each and have all modern improvements. They will be sold to employees of the company on a monthly payment basis, practically the equivalent of rent. Thirty houses will be ready for occupancy about January 1, and the balance about April 1.

The Black Hawk Tire & Rubber Co. is now equipping its factory at Des Moines, Iowa, and expects to begin manufacturing fabric and cord tires and red and gray inner tubes by January 1. The officers are: William Moran, president; John F. Griffin, vice-president; Earl A. Lewis, secretary; and J. J. O'Malley, treasurer. Paul I. Anderson is superintendent, and C. E. Reiss technical engineer.

The Haywood Tire & Equipment Co., Indianapolis, Indiana, is to build a foundry on Harding street and Pennsylvania railroad, to cost \$115,000. This will be of the monitor type, 100 by 200 feet, equipped with traveling overhead crane and new machinery. A machine shop will be added, also. M. E. Haywood is president.

The International India Rubber Corp., South Bend, Indiana, is receiving bids on a factory addition one story high, 110 by 117 feet. This is one of three new additions planned.

The Kokomo Rubber Co., Kokomo, Indiana, has opened six factory branches in southern and middle-western states and has appointed Earl P. Logan director of sales. Mr. Logan was

formerly in charge of the central district of the Federal Rubber Co., Cudahy, Wisconsin, with headquarters in Chicago. The Kokomo company is one of the older tire companies, having been established in 1895 for the manufacture of bicycle tires, druggists' sundries, etc. Three years after its inception, it also began making automobile and carriage tires. In the same year, 1898, it doubled its initial capital, and in 1901 quadrupled it, while in 1917 it increased it from \$200,000 to \$1,000,000. In the meanwhile it has established branches, incorporated as individual companies, under the laws of several other states.

Charles E. Wood, Singer Building, 149 Broadway, New York City, crude rubber broker, is opening an office in the Advertising Building, Room 1420, Chicago, Illinois, in charge of Clinton Taveniere, for the last nine years with the Goodyear Rubber Co. of New York. It is Mr. Wood's intention to get closer to manufacturers and give them prompt and efficient service, and the Chicago office is being opened with this purpose in mind.

J. B. Gabeline, president and general manager of the Standard Four Tire Co., Keokuk, Iowa, has left for an extended trip through the South. His company is showing rapid progress. Three large mills and one 68-inch calender are being installed in the new addition to the company's factory.

Plans were drawn two years ago for a \$600,000 addition to the Brunswick-Balke-Collender Co. tire and tube factory at Muskegon, Michigan, but the work was temporarily held up on account of war conditions. The plans are now being redrawn on a much larger scale and ground for the new structure will be broken just as soon as the drawings are completed. The battery jar department, of which H. G. Vanderhoef was recently appointed general sales manager, has outgrown its present quarters and will be allotted larger space in the new additions.

Because of expansion plans, the capitalization of the Hawkeye Tire & Rubber Co., Des Moines, Iowa, was increased on October 28 from \$1,500,000 to \$3,500,000, \$875,000 of the increase being preferred stock and \$1,225,000 common.

Work has been started on the company's new building, the cost of which will amount to approximately \$350,000. The business has grown to such an extent that the demand for Hawkeye tires during the last six months has been far in excess of the factory output.

The Nebraska Tire & Rubber Co., Omaha, Nebraska, has been operating its factory night and day to take care of the volume of business which has been secured. The "Cornhusker" tire is a hand-made, extra ply, oversized tire, and has made good from the start. Plans are under way for increasing the production to take care of the growing demand.

TECHNICAL ENGINEER OF THE BLACK HAWK TIRE & RUBBER CO.

C. E. Reiss, who resigned from the chemical department of The B. F. Goodrich Co., Akron, Ohio, last September to accept the position of technical engineer of the Black Hawk Tire & Rubber Co., Des Moines, Iowa, was graduated from Ohio State University in the class of 1915, in chemical engineering.

Immediately after graduation he entered the chemical laboratory of The B. F. Goodrich Co., under George Oenslager, now the company's chief chemist. At the end of the first year he began working on mechanical rubber goods under Mr. Noble of the development department and during the war worked on all gas-mask compounds in connection with factory production. Mr. Reiss' experience in these departments undoubtedly fits him excellently for his new position with the Black Hawk company.

C. E. REISS.

PRESIDENT OF THE F. E. PARTRIDGE RUBBER CO.

FREDERICK E. PARTRIDGE, president of the F. E. Partridge Rubber Co., Limited, Guelph, Ontario, Canada, was born in Bowdoinham, Maine, in 1873, and entered the rubber industry at the age of 21 as a workman in the factory of the Maynard

Shoe Co., Claremont, New Hampshire, manufacturer of tennis shoes. His aptitude for the business secured for him rapid promotion to the position of foreman and then of superintendent. Five years later he became night superintendent at the Boston Woven Hose & Rubber Co., Cambridge, Massachusetts, which position he resigned four years later, and after a short term as general superintendent of the Combination Rubber Co., Bloomfield, New Jersey, a call came to him to serve as superintendent for the Canadian Rubber Co., Montreal, Canada, of which concern he later

was made manager, and still later, was elected vice-president.

Making a success of other people's business induced him to strike out for himself in 1915. Organizing a company under his own name, he rented a small factory at Guelph, Ontario, which has been constantly added to and enlarged until it will soon accommodate a working force of 500 people in its big, modern five-story building, the daily output of which is 475 tires, 600 inner tubes, 500 water bottles and 1,000 tobacco pouches.

Mr. Partridge is also the leading spirit in the Northern Rubber Co., Limited, Guelph, Ontario, an entirely separate concern which will soon commence the manufacture of the "Partridge" brand of rubber footwear.

CANADIAN NOTES.

THE FIRESTONE TIRE AND RUBBER CO. OF CANADA, LIMITED, has been formed in Canada, capitalized at \$5,000,000, and a factory will be built at Hamilton, Ontario, where 135 acres of land have been bought. On one-half of this plot a housing plan for employes, similar to Firestone Park, Akron, Ohio, U. S. A., will be carried out, the other half being occupied by modern factory buildings constructed on the unit plan.

In addition to the products now made by the Firestone company in Akron, the Canadian organization will manufacture mechanical goods, including belting, and a boot and shoe department will probably be established. A plant for the manufacture of steel rims will also be built soon. The new company, created primarily to meet the Canadian demand for Firestone products, will also share in the company's export business, particularly in the British Empire.

The K. & S. Canadian Tire & Rubber Co., Limited, 527 Yonge street, Toronto, Ontario, is building a modern plant.

In Kitchener and Waterloo, Ontario, as in many other industrial centers, the demand for dwelling houses exceeds the supply. The Dominion Rubber System finds that it is handi-

capped in obtaining the additional permanent help it needs because of the difficulty of housing them. Kitchener was unwilling to take the responsibility of building homes under the Ontario Government Housing Act, which provides for the loaning to municipalities, or to housing companies operating under municipal commissions. However, when the Dominion System offered to guarantee the city against loss, the city agreed to legalize the enterprise by appointing a municipal housing commission. The adjoining city of Waterloo asked to be put on the same basis as Kitchener, and under this agreement 200 houses will be erected in Kitchener and 100 in Waterloo, mainly for workers in the Dominion rubber plants in the larger city.

PACIFIC COAST NOTES.

By Our Regular Correspondent.

LOS ANGELES NOTES.

J. O. WARD, Los Angeles district manager of The Miller Rubber Co., reports that the growth of business in his district has made necessary the construction of a new two-story building on Hope street, the former quarters having been entirely outgrown.

Douglas Fairbanks, the well-known motion picture actor of Los Angeles, has ordered the first set of pneumatic tires to be manufactured at the new plant of the Goodyear Tire & Rubber Co. of California now under construction in that city.

The Carlisle Tire & Rubber Co., Carlisle, Pennsylvania, has appointed the Cooper & Kehler Co., Los Angeles, manager of its new branch in that city.

The Mohawk Rubber Co., Akron, Ohio, will open its new branch at 18th and Flower streets, Los Angeles, January 1, 1920.

SAN FRANCISCO NOTES.

The Braender Tire & Rubber Co., Rutherford, New Jersey, has opened a Pacific Coast branch at 133 Eighth street, San Francisco.

The Mohawk Rubber Co., Akron, Ohio, has a Pacific Coast branch at 1436 Van Ness avenue, San Francisco.

NORTHWESTERN NOTES.

A sales conference of all the Goodrich representatives of the northern Pacific Coast territory was recently held in Seattle, Washington, and over 50 salesmen were in attendance. This is one of the largest and most important territories in the Goodrich organization including the states of Washington, Oregon, Montana, Idaho, Alaska and the province of British Columbia, upwards of 282,161 automobiles being owned within its borders. W. D. Albright, northwestern manager of the Goodrich company, called the conference and presided at the meetings, during which many important matters relating to trade in the district were discussed. The rubber salesmen were given a banquet at the Butler grill together with a smoker and entertainment which concluded the conference.

The Seattle Automobile Tire Co., one of the largest individual tire retailing firms in the West, with stores in all the principal cities on the Coast, has contracted for the handling of the Ajax and Fisk tires.

C. L. Brockway has been named to manage the tire department of the United Motors Co., of Seattle, and will have charge of the distribution of Thermoid tires in the entire northwest section of the state of Washington. Mr. Brockway has been engaged in the tire business for six years, coming to Seattle from Sioux City, Iowa, last December.

THE BATAVIA RUBBER AUCTIONS, WHICH HAVE NOT BEEN HELD for some years, were resumed in October, 1919, by the Batavia Rubber Association.

THE RUBBER TRADE IN MASSACHUSETTS.

By Our Regular Correspondent.

THE MASSACHUSETTS INSTITUTE OF TECHNOLOGY, which many consider the greatest institution of its kind in this country, and in the world, has offered its services as expert and research engineer in a consulting capacity to manufacturers, upon payment of a suitable annual fee. The Institute has on its faculty many of the leading industrial scientists in this country. Annually many scientific problems are studied and worked out, and therefore the solution of many such problems which confront manufacturing establishments are already available. In brief, the Institute offers its services in a consultant capacity, on an annual salary basis, and in return for this fee will permit the firms thus retaining such services to make use of the Institute's extensive library, files and laboratory facilities, and to consult with the members of its staff and faculty on problems pertaining immediately to the needs of the client firms or corporations.

Carried to its conclusion, this plan will make the Institute one of the greatest consulting bodies in the world. Its range will cover practically every field of technical research. Through the plan those who devised it hope to see evolve a new relationship between Tech and the industrial organization of the country. American industry, they say, has long been in need of a clearing house of scientific knowledge. The Tech plan, they declare, creates a clearing house.

Almost immediately upon the announcement of this plan many prominent firms became subscribers, among the first being the American International Corp., New York; the General Electric Co., Schenectady, New York; the Simplex Wire and Cable Co., The American Telephone and Telegraph Co., and The Goodyear Tire & Rubber Co.

In Quincy, Massachusetts, where, during the World War, more than 18,000 men were employed in the shipbuilding works, there was great difficulty in housing the workmen. The Government built dormitories as well as single houses for their accommodation. Since the armistice was signed there has been a heavy reduction in the number of men employed in this work, and many of these houses became available for other workmen. Last month there was a widespread rumor that the Hood Rubber Co., of Watertown, had bought 21 of these dormitories, and land adjacent. Coupled with this was the conjecture that the Hood company would erect an extensive manufacturing plant there and give employment to a large number of workmen. Inquiry regarding the truth of this rumor elicited a distinct denial, Mr. Hood stating that there was nothing in it.

A "get-together" dinner was held, late in October, at Phillips Inn, Andover, the development of recent plans of the Tyer Rubber Co., of that town, for the establishment of a service department. The company, fifty in number, comprised the general manager, superintendent, the heads of each department, all the foremen and one or more delegates from each department of the works, the latter being elected by the workers in these departments. To emphasize the thought that all present met as employees only, place cards were drawn by lot, so that representatives of the management were seated, not as a group, but with the other employees, and the spirit of good-fellowship enjoyed by all attested the wisdom of this plan. The service manager acted as toastmaster, and the matters introduced by him became subjects for general discussion in which both management and workmen took enthusiastic part. These included the value of cooperation between individuals and the company and between department and department; the kind of goods manufactured; the use of a suggestion box, and the desirability of a definite plan for further cooperation. As a result of the meeting the plan for the suggestion box was adopted and a sub-committee from the dinner group appointed to plan a permanent service organization, to take the form of a service association, operat-

ing through a general improvement or works committee. An informal musical program by several employees added much to the pleasure of the evening.

The Cambridge Rubber Co., Cambridgeport, has let the contract for a five-story brick addition to its factory, to cost about \$50,000. Each floor will be 74 by 90 feet. The new part will be devoted to the automobile top fabric and the tennis shoe departments. When the addition is completed, the company will have a total floor area of over 100,000 square feet.

The Beacon Rubber Co., Lynn, Massachusetts, manufacturer of rubber heels and fiber and rubber soles, has purchased a two-story factory building at the corner of Commercial and Bennett streets, West Lynn. The factory has a power plant connected and a floor space of about 10,000 square feet. The lot is a large one with plenty of room for additional factory space when required. Edmund J. Twomey is president of the company and James E. Connor secretary and treasurer.

The Pyrotec Leather Co. is the name of a concern recently incorporated in the sum of \$50,000 to manufacture artificial leather, which has started fitting up a factory on Whitney street, Leominster, this state. Winthrop M. Mays is president; Ralph A. Robertson, secretary, and Harold A. Burdett, treasurer.

The Boston Woven Hose & Rubber Co., Cambridge, has made arrangements whereby its employees may obtain advice on all legal questions free of charge from the Harvard Legal Aid Bureau, thus saving them the expense of employing an attorney. Hours have been arranged so that the Bureau may be consulted without interfering with working hours. This will undoubtedly be of great assistance to many of the workers, and particularly so in the case of those who become victims of loan sharks, whose practices are well known to every large employer of labor.

The company will soon start classes to teach English to foreign-born employees, this also at no expense to them. The classes will be held from 12 to 1 o'clock, so as not to interfere with working hours.

The Converse Rubber Shoe Co., Malden, has purchased a large, old-fashioned estate in the residential section of that city, and will remodel the big house, modernize and furnish it to accommodate 50 persons with board and room, the intention being to run it on the club or cooperative plan to house out-of-town women employees of the company. The work of remodeling will begin soon, and is expected to be completed at an early date in 1920, and thus materially reduce the high cost of living there, for Malden, like all cities having extensive industries, is at present short of boarding and rooming accommodations, which, of course, adds to the difficulty of manufacturers in securing sufficient and efficient help.

Will diving suits of rubber be superseded by those made of brass? Last month a trial was made of a suit of that metal, weighing 400 pounds, in which the diver went to a depth of 360 feet under the surface of the sea in Boston harbor. It is estimated that at that depth the pressure was about 150 pounds to the square inch, and it is in this greater power of resistance that the metal suit is claimed to have the advantage over the ordinary rubber diving suit. As a precaution against any possible defects, which might become apparent under the increasing pressure the diver was lowered into the water very slowly, half an hour being required for the trip to the bottom. John F. Turner, the diver, has had wide experience as a diver and some years ago reached a depth of 154 feet in an ordinary suit. He says that this invention is the most nearly perfect thing of the kind he has seen. It is the intention of the inventor and the diver to attempt the salvage of \$30,000,000 in gold bullion from the British steamer *Laurentic*, which was sunk off the Irish coast during the World War.

The eighteenth annual automobile show will be held in Mechanics Building, in Boston, March 13 to 20 inclusive. Approximately 105,000 square feet of floor space will be available for exhibition purposes, and the show is expected to surpass all previous affairs of the kind in this city.

Among the speakers at the banquet of the Victorian Club, Boston, in November, was Elston E. Wadbrook of MacNamara & Wadbrook, Inc., crude rubber broker, New York City.

The Firestone Tire & Rubber Co., Akron, Ohio, has appointed George M. Powell territory salesman out of Springfield, Massachusetts.

T. E. Kane, formerly chief mechanical engineer of the Plymouth Rubber Co., Canton, Massachusetts, has become associated with the sales service of the Mansfield Machine Shops, Sydney Birch Co., Mansfield, Massachusetts.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

RHODE ISLAND CONCERNS engaged in the manufacture of rubber goods of every grade and character are busy, running practically to capacity, with encouraging indications for a continuance for an indefinite period. The scarcity of skilled employees and the increased cost of materials have been handicaps that have caused the management of all the concerns considerable anxiety and trouble. Labor unrest, involving demands for increased wages, shorter hours and an occasional incipient strike, have added to the perplexities and difficulties of the general situation. Many of the companies have been making additions to their plants, while others would do so if there were favorable prospects of securing the additional labor required to operate the new machinery.

The work of improving and extending the plant of the National India Rubber Co., at Bristol, has been rapidly pushed during the past few weeks. Substantial improvements and repairs have been made on the company's wharf and other property along the water front at the foot of Church street, and arrangements have been made for burning crude oil instead of soft coal for fuel, which, it is claimed, will save the company much labor and expense. A new reinforced concrete tank, 56 feet in diameter with a capacity of 150,000 gallons, has been constructed under the surface of the ground near the boiler house, from which the oil will be pumped out and sprayed into the boilers by steam. The same boilers that have been in use for the burning of coal will be utilized with some necessary changes in the attachments of pipes.

Already the beneficial results of the day nursery that was established last spring are evident, and the great increase in the number of children left at the nursery while their parents are at work has necessitated the erection of an addition with a sun parlor 10 by 25 feet.

Among other features of the welfare work of the National Rubber Co., the Americanization of the employees is being vigorously pushed. Miss Evelyn Carter, for several years a teacher in the public schools of Bristol, has been engaged to take charge of this educational work.

Following conferences between committees representing the employees and the manager of the National India Rubber Co., the matter of establishing a company store for the sale to employees of meats and groceries is under consideration and there are promising prospects of a cooperative store being established.

The equity suit of the I. T. S. Rubber Co., of Elyria, Ohio, against the United Lace & Braid Manufacturing Co., of Providence, alleging infringement of patent rights on a rubber heel, has been assigned for December 29 in the United States District Court for the District of Rhode Island.

The Davol Rubber Co., Providence, Rhode Island, has announced the following promotions and changes in its personnel: R. J. Fries, manager of sales in addition to being advertising manager; Walter L. Davol, assistant sales manager; J. A. Clemens, recently returned from service with the American Army of Occupation at Coblenz, production manager; Jesse Little, production superintendent; and T. B. Dowling, factory foreman.

The George Grow Tire Co., Providence, manufacturer of fabric and cord tires, has enlarged its local retail and wholesale store, and will occupy the premises at 67 to 75 Exchange street as an office and salesroom.

The K. & C. Tire & Rubber Co., which recently opened its manufacturing establishment at 13-15 Calender street, Providence, is headed by Cornelius F. Kelleher, manager, and James H. Creamer, treasurer. Both young men were recently discharged from military service. Mr. Kelleher was for eight years employed by the Sterling Tire Co., where he served as chief chemist. He was also employed in a similar capacity by the United States Rubber Co., at its Valley street plant. The company manufactures both cord and fabric tires, inner tubes, repair stocks and vulcanizing cements. A cheaper but longer life inner tube will soon be placed on the market.

Samuel P. Colt, president of the United States Rubber Co. and of the National India Rubber Co., its Bristol subsidiary, on Thanksgiving Day telegraphed Daniel Frohman, president of The Actors' Fund Home, West New Brighton, Staten Island, New York, his subscription of five thousand dollars as a "Rhode Island Thanksgiving offering to the Actors' Fund of America," for which contributions are being asked.

The Collyer Insulated Wire Co., Pawtucket, Rhode Island, is building a two-story concrete addition, 120 by 60 feet, to cost approximately \$50,000.

Two three-story brick buildings on Main and Carver streets, Pawtucket, 60 by 160 feet, are to be erected by the Tubular Woven Fabric Co. It is expected that the structures will be ready for occupancy in about five months. Both will be equipped with modern machinery and will be used in the manufacture of electrical insulation covering.

The O'Bannon Corp., manufacturers of carriage cloth at West Barrington, has commenced fitting up a new restaurant on the second floor in the main building of its factory for the accommodation of the office force.

The Lynn Rubber Co.'s plant at Warren is very busy on orders for rubber heels. Since the factory was first opened less than a year ago there has been a constant increase in the number of employees and it has been found necessary already to make additions to the equipment.

THE RUBBER TRADE IN NEW JERSEY.

By Our Regular Correspondent.

TRENTON NOTES.

THE rubber manufacturers of Trenton report that the early winter finds the trade very brisk with prospects for a good season. All the tire concerns are very busy and expect to continue so through the winter. One prominent manufacturer informed a representative of THE INDIA RUBBER WORLD that the mechanical rubber business had lately improved 100 per cent.

Some of the Trenton rubber manufacturers were represented in the parade held in celebration of Armistice Day. The Joseph Stokes Rubber Co. captured the second prize of \$25 for heavy truck floats. The float, which was brilliantly lighted, was entitled "Peace, Honor and Purity." A number of the girl employees of the plant wore appropriate costumes. Other rubber concerns also had floats.

The Ajax Rubber Co., Inc., Trenton, has purchased five

dwelling houses adjoining the plant on North Olden avenue and will later have them razed for the purpose of building an extension to the works.

Sixty employees of the Ajax Rubber Co. have recently taken out naturalization papers at the Mercer County Court House, making the company 100 per cent American. English classes will be opened for the men in the Ajax plant.

The two-story brick plant of the Puritan Rubber Manufacturing Co., situated at the foot of Perrine avenue, Trenton, was destroyed by fire early on the morning of November 17. The blaze started in the packing room and was of unknown origin. The Puritan Rubber Co. recently changed hands and is now owned by Boston business men. The concern manufactured mechanical rubber and molded goods and had a large stock on hand. All the office effects not in the safe were destroyed, and the machinery was wholly ruined. The company officials have not yet decided on rebuilding plans.

The Delion Tire & Rubber Co. has filed a certificate of dissolution in the office of the Secretary of State at Trenton. The plant of the company was recently taken over by the Bergougnan Rubber Corp., of which details were published in THE INDIA RUBBER WORLD, September 1, 1919.

Walter C. Price and associates, Baltimore, Maryland, have bought the business, name, good-will, trade-marks, etc., of the Delion company, which has been reorganized with the same name under the laws of Maryland, with offices at 131 West Mt. Royal avenue, Baltimore. A modern factory will be built, having a daily capacity of 400 tires, and high-grade fabric and cord tires and tubes will be made.

Fay, Miller & Youngs, manufacturers of druggists' rubber sundries, with a factory at Barberton, Ohio, has purchased the plant of the Fidelity Pottery Co., at Trenton. The property consists of three buildings of 50,000 square feet of floor space, and a good portion of land. The company is making a number of alterations, and when these are completed the machinery and equipment of the Barberton plant will be removed here and that plant closed. The officers of the company are: Charles L. Fay, president; Arthur M. Youngs, vice-president; Merle L. Youngs, secretary and treasurer, and Fred H. Miller, assistant secretary and treasurer. The company has offices at 75-77 Spring street, New York City.

MISCELLANEOUS NEW JERSEY NOTES.

The Duratex Co., 768 Frelinghuysen avenue, Newark, manufacturer of rubber goods, will expend about \$300,000 for construction and about \$200,000 for equipment in a series of buildings to be erected. The company has a tract of seven acres of land and will erect nine buildings. The main factory building will be 100 by 500 feet. The storage building will be 200 by 60 feet, two stories high. The laboratory will be 40 by 40 feet. There will also be an addition to the power plant.

Vice-Chancellor Backes has granted an order directing parties in interest to show cause why Elgin L. McBurney, of Jersey City, receiver for the Indian Tire & Rubber Co., of New Brunswick, should not be permitted to accept a bid of \$50,000 for the company's business and assets. The concern manufactured solid rubber tires for trucks. Mr. McBurney was appointed receiver last May in a proceeding instituted by Bilder & Bilder before Vice-Chancellor Lane in behalf of Virginia A. and Rose L. Cavanaugh, of New York, stockholders and creditors of the company. Immediately after Mr. McBurney's appointment, the corporation's directorate, in violation of an order restraining the corporation from the exercise of its franchise, had counsel file a voluntary petition in bankruptcy, with the result that certain directors were adjudged in contempt. No penalty was ever imposed, however. In the schedule incorporated in the bankruptcy petition, the liabilities were put at \$94,118.74, while the assets were inventoried at \$121,614.87, the principal items being real estate, \$39,000; machinery, \$37,000, and material on hand,

\$20,000. The corporation was said to have \$167,700 of capital stock outstanding.

The Jenkins Rubber Co., Elizabeth, New Jersey, has made arrangements to take over the brass founding section of the Crane Co.'s plant at Bridgeport, Connecticut, where formerly much of the metal parts of their valves were manufactured under contract. Business with the company is reported excellent.

George W. Johnson, for some years a salesman in the employ of the Lambertville Rubber Co., died at a Trenton hospital on November 12 after an illness of several weeks. The deceased was 39 years old and a member of the Citizens' Band of Lambertville and New Hope. He is survived by his widow. Mr. Johnson was born at Flemington, this state.

The Victory Tire & Rubber Co., Asbury Park, New Jersey, has changed its name to the Rydon Tire & Rubber Co.

The Stanwood Rubber Co., Newark, New Jersey, has acquired the majority of the stock of the Hardman Rubber Corp., New Brunswick, New Jersey, and has completed arrangements for the distribution of the Stanwood company's output in twelve different cities through branches, in addition to twenty-four other retail distributors.

The Overland Tire Co., formerly at 15-25 River street, Newark, New Jersey, has removed to Cortlandt and Holmes streets, Belleville, New Jersey.

The Okonite Co. has established its executive offices at its factory at Passaic, New Jersey.

The Braender Tire & Rubber Co., Rutherford, New Jersey, has transferred its advertising account from the Manufacturers Publicity Co., 30 Church street, New York City, to Collin Armstrong, Inc., 1463 Broadway, to which all correspondence concerning advertising should be addressed.

EASTERN NOTES.

The Pennsylvania Rubber Co., Jeannette, Pennsylvania, has made arrangements for displaying its products in five rooms on the northern end of the Garden pier, Atlantic City. C. B. Williamson will be in charge.

The Kelley Tire & Rubber Co., 962 Chapel street, New Haven, Connecticut, has purchased land and expects soon to let a contract for the erection and equipment of a plant costing about \$250,000, for the manufacture of Kelley Kord and Kelley K tread tires and Kelley Blue tubes. Edward J. Kelley is president and the other officers are: Charles H. Bortelle, Jr., vice-president and treasurer, and William F. Alcorn, secretary.

The Goodyear Cotton Mills, Inc., Killingly, Connecticut, is planning another cotton mill of 30,000 spindles, 140 by 430 feet, two stories in height, to balance its weaving capacity. Yarn is now being bought in anticipation but contracts have not been let. The new unit will require about 60 additional tenements for housing employees.

E. I. du Pont de Nemours & Co. (incorporated), Wilmington, Delaware, has bought about 65 acres of land near Baltimore, Maryland, for storage purposes.

The Reliance Tire & Rubber Corp., Wilmington, Delaware, has been authorized to do business in the State of New York, capitalized at \$250,000. E. Holway, 50 East 42d street, New York City, has been appointed representative.

The Oldfield Tire Co., Cleveland, Ohio, has been authorized to do business in the State of New York, with a capital of \$500,000, and has appointed R. L. Mills, Bush Terminal, Brooklyn, New York, its representative.

The Rochester Tire & Rubber Co., Rochester, New York, has increased its capital from \$500,000 to \$750,000.

The National Wholesale Druggists' Association held its forty-fifth annual meeting at the Hotel Grunewald, New Orleans, Louisiana, November 3-7, inclusive. Among those present were the following representatives of the Davol Rubber Co., Provi-

dence, Rhode Island, manufacturer of druggists' rubber sundries; P. R. Wesley, general manager; E. J. George, Chicago office; G. A. Sheehan, San Francisco office; E. G. Hartwell, southwestern representative; and John A. Burgess, southeastern representative.

The Record Tire & Manufacturing Co., a Delaware corporation, has dissolved under the laws of the State of New York, but has been authorized to do business in that state through its representative, H. F. Hartjen, at 238 West 53d street, New York City.

The Seamless Rubber Co., Inc., New Haven, Connecticut, has its new \$2,000,000 plant well under way and has sold the property on Hallock avenue, where it is building, to trustees for the Seamless Rubber Associates, Inc., who, in turn, have leased it to the Seamless Rubber Co., Inc., for twenty years at \$72,000 annually. The property is now being connected with the New Haven railroad by a spur track. It fronts on the harbor.

The Amalgamated Tire Stores Corp., whose organization was noted in our issue of November 1, 1919, has leased the five-story building at 1974 Broadway, New York City, for its general offices and eastern distributing point, and will open about thirty stores in other cities.

The Kokomobile Tire & Supply Co., Buffalo, New York, has been organized to distribute to the retail trade in western New York and northern Pennsylvania the products of the Kokomo Rubber Co., Kokomo, Indiana, including bicycle tires, and the Wright & Ditson-Victor Co. sporting goods lines. C. W. Barrell, formerly with The B. F. Goodrich Rubber Co., Akron, Ohio, will manage the concern; G. B. Wilkins, of Indianapolis, will have charge of sales, and R. V. Henery, of the office and direct advertising.

The Middletown Rubber Co., Inc., 280 Broadway and 5 Columbus Circle, New York City, has secured a most desirable site for a factory on the main line of the Erie railroad, at Middletown, Orange County, New York, and plans to erect there a factory for producing cord tires. The officers of the company, which was incorporated last August with an authorized capital of \$1,000,000, are: Myron J. Friedman, Chicago, Illinois, president; William Rusnak, Chicago, vice-president; S. A. Thompson, Cleveland, Ohio, secretary; and J. T. MacDonald, Cleveland, treasurer and general manager.

The New York Asbestos Co., formerly at 203 Front street, New York City, has removed to 394 Canal street, where it has leased a six-story loft building for a term of years.

The Universal Rubber Products Co., J. B. Topham, president, has completed the equipment of a modern tire manufacturing plant located at Zelienople, Pennsylvania. The output will be tubes and unguaranteed tires. Manufacturing operations will begin December 1, 1919.

The General Electric Co., Schenectady, New York, has completed the erection of an extension 100 by 100 feet, which has been added to building No. 89.

The Motor and Accessory Manufacturers' Association, Aeolian Building, New York City, has arranged for its members to participate in the show of the Minneapolis Automobile Trade Association, to be held from January 31 to February 7, 1920. In addition, shows at New York, Chicago, and Boston have been sanctioned by the M. & A. M. A., the largest number of official automobile shows ever sanctioned in any one year.

Plans of the Beacon Tire Co., Beacon, New York, for the coming year include the eight-hour day, an attractive insurance feature free to employees, a bonus system embracing all workers, athletic games and meets, etc. The new building will soon be completed and new machinery installed.

A. Schrader's Son, Inc., Brooklyn, New York, manufacturer of tire valves, gages, etc., is building a new ten-story building of concrete and steel construction, 90 by 196 feet, to be adapted for the operation of heavy machinery on every floor and to be

equipped with automatic sprinklers, stand-pipe connections to street with outlets on each floor to the two stair towers, sprinkler tank on roof cross-connected with sprinkler tank on Building No. 1, Manhattan district fire alarm system, hospital for employees, lunch rooms, lockers, a library, etc.

The J. & D. Tire Co., Charlotte, North Carolina, has changed its name to the McClaren Rubber Co., from the name of its president, H. L. McClaren. The plant will be enlarged and distribution organized in the principal cities.

The Pan-Rubber Products Co., 311 Steinway avenue, Long Island City, New York, has been established as a retail store to sell well known brands of rubber goods to small consumers who cannot buy direct, and to act in an advisory capacity to firms requiring special goods. F. K. Bodenschatz is president and general manager.

The Polack Tire & Rubber Co., has transferred its general office from Broadway and 62d street, New York City, to its factory at 145 Howard avenue, Bridgeport, Connecticut.

PROSPECTIVE VALUES OF RUBBER.

The question of the valorization of india rubber is considered again in "*Le Bulletin de l'Association des Plantateurs de Caoutchouc*," of Antwerp, which regarded it as not practical in 1913. Valorization now is made to mean not merely the fixing of the standard price by the government, by buying the surplus crops or otherwise, but the regulation of prices by any combined effort such as that of trusts or associations and by any means, such as the restriction of output or exportation which the Rubber Growers' Association tried to put through with the plantation rubber of the British Far East in 1918.

The *Bulletin* has examined market conditions and believes that under present conditions there is no prospect of a need of restriction. So long as the London price does not fall below two shillings a pound, with the increased demand there seems to be no danger of overproduction for two or three years, at least, even if the Brazilian cost price were reduced far enough to allow the Pará sales to rise to 35,000 or 40,000 tons again. It seems a proper time to put the plantations in order, to improve the trees and the cultivation and not worry over valorization.

The London prices for the highest grades for future delivery in the first six months of 1920 went as high as 2 shillings 4½ pence; first latex crepe rose from 22 pence in June to 28 pence in September, while hard Pará in the same period went up only a half penny, and the better grades of plantation are taking its place. It will not be surprising if the curve of plantation prices does not again rise as high as that of Pará prices. The stocks in Europe and Malaya are in hands that are able to hold them. The formidable increase in consumption in the United States indicates that the Malay production will be absorbed into a regular channel, and the market pays no heed to the steady increase in Malayan production.

With regard to the establishment of new markets in Europe for the sale of rubber the *Bulletin* quotes a specialist's opinion. He believes that the change made during the war, by which the great increase in the United States demand was supplied by sales and shipments direct from the Straits, renders the success of new markets doubtful. London must retain its place as the center for future sales, while Antwerp and Hamburg are favored by their geographical position. A few years before the war broke out France tried to establish a rubber market at Havre, counting on regular shipments from the French Congo, but the experiment was a wretched failure. Any market scheme counting on the importation of wild rubbers by the countries whose colonies produce it, seems likely to fail because the impurities of those classes of rubber increase the relative cost of importation and diminish their usefulness so that dealings in them will become steadily less remunerative when competing with lower-priced plantation rubber.

The Rubber Trade in Great Britain.

By our Regular Correspondent.

THE POSITION of affairs remains much the same plenty of orders on hand and difficulty in executing them, owing to strikes in this or that direction. Transport and the delivery of letters were much hampered by the nine-day railway strike, which undoubtedly owed its collapse to the rapidly improvised motor truck service all over the country. The strike of iron molders, which lasted three weeks, caused serious delay in the engineering trades, and rubber works in course of installing new machinery have had a serious setback.

DETERIORATION OF RUBBER.

It is not often that rubber works keep their purchases of plantation rubber for three or four years without turning the rubber out of the boxes for use or inspection. I had a case of this sort before me recently, however, when it was found that the rubber was very much decayed and quite unfit to be used for a good class of work. I do not suppose the seller would be prepared to consider redress after three years, though, I hardly think that much good quality plantation rubber will be found to have gone wrong even if it is kept for three years. I have reason to suppose that in this case the rubber which was sold as clean brown crepe was not *Hevea* rubber but the product of some other tree which yields a rubber more prone to decay. I do not know that it is always customary for the term *Hevea* to be used in dealings between buyer and seller, and the point seems one of importance as premature decay of the rubber after manufacture might lead to considerable trouble. This would be especially annoying to firms with a reputation and desirous of buying a high quality rubber for import.

BENZOL POISONING IN PROOFING.

In the Factory Inspector's Report for 1918 reference is made to several cases of poisoning by benzol fumes, two or three of which proved fatal. I remember that early in that year all rubber works received an official request to state whether they used benzol in their establishments, though the reason for the inquiry was not stated. Speculation, therefore, was rife on the matter which it was thought had something to do with attempts to cheapen production of government munitions by the use of benzol at a low controlled price instead of solvent naphtha at over 4 shillings per gallon for which it was then selling. However, it is now clear that the inquiry was on hygienic grounds only. As a solvent in proofing, benzol has never been popular because of its high volatility, as compared with solvent naphtha, and because a solvent boiling at a uniform temperature does not give as good results at one boiling over a range of 30 to 40 degrees, such as solvent naphtha. In the case of rubber solutions as distinct from rubber "doughs," volatility has always been a desideratum, and it has been a common thing to use a mixture of solvent naphtha and light petroleum spirit.

It would seem from the reports of the fatal cases that these need not have occurred if there had been proper ventilation of the work rooms. It is now recognized by the Factory Inspection Department that the alternative for forbidding the use of benzol in rubber works is the installation of efficient ventilation, and this requisition seems now to have been generally and readily complied with by the manufacturers. Now that benzol has risen in price and the sale is controlled by a ring of producers, mainly for motor purposes, I doubt if it will continue to find its war-time uses in rubber works.

The report contains an interesting reference to a new rubber solvent which was recommended to the trade by a government department in 1918. It is a xylol compound, stated to consist

half and half of hexamethylene and metexylol. Members of the Medical Research Committee reported that it could be used as a rubber solvent with much less danger than benzene.

NORTH BRITISH RUBBER CO., LIMITED.

The profit to the North British Rubber Co., Limited, for 1918, after making allowance for excessive profits duty, was £180,512, and with the balance brought forward there is £145,842 for disposal. It goes without saying that the profits were maintained despite the fact that labor, coal and all other charges showed an increase. This is almost the universal case with reports of manufacturing businesses at the present time.

The report states that since the signing of the armistice, and notwithstanding the cessation of practically all war contracts, the output of the works has not been seriously affected. Certain important resolutions referring to alterations in the articles of association and to the increase of capital are to be submitted to an extraordinary general meeting of shareholders. It is proposed to transfer to reserve £100,000 in respect to depreciation previously debited to profit and loss in excess of what was necessary, and to capitalize that amount by issuing fully paid shares to the ordinary shareholders on the basis of two shares of £1 for each ordinary share of £5, it being proposed to divide these £5 shares into £1 shares. It is further proposed to issue £150,000 ordinary shares at a premium of 2s. 6d. per share in order to develop the productiveness of the works.

RUBBER RESEARCH ASSOCIATION FORMED.

The Research Association of British Rubber & Tyre Manufacturers was registered in London on October 9, 1919 as a limited liability company, not joined for purposes of profit. Its objects are to promote research and scientific work that may be of use to the rubber, tire and kindred industries. The number of members is declared to be 200; they are divided into ordinary, associate and honorary. The association is to be run by a board of managers, and care is taken in the articles of incorporation to keep out foreign control.

ABNORMAL DEMAND FOR TIRES IN ENGLAND.

There is an abnormal demand for motor tires in England, owing to the railroad strike during which the wear and tear on the tires of the cars used for transportation was very great. The shortage is likely to continue for some time. It is understood, also, that Germany is going to set up motor transportation on a large scale, as the German railroads are badly worn out. This would call for something like 20,000 tons of rubber for tires, which would have to be imported from the United States and England.

G. E. C. RUBBER-COVERED CABLE.

The Pirelli general cable works at Southampton, England, is producing G. E. C. tough rubber-covered cable in all sizes—single, twin or three-cored, which is particularly suitable where a flexible cable, likely to be subjected to rough usage, is needed. Each core, of the best H. C. tinned copper wire, is insulated with vulcanized india rubber, and the whole is then sheathed with tough rubber that is water, oil, alkali and acid proof, and will withstand the roughest use that can arise in industrial work. It can be put directly into new plaster when used for house wiring. On account of its peculiar qualities the Institution of Electrical Engineers provides in its wiring rules for the employment of that cable.

RUBBER SPONGE MANUFACTURE IN FRANCE AND AMERICA.

ACCORDING to A. Hutin in "*Le Caoutchouc et la Gutta Percha*," the manufacture of rubber sponges, which flourished chiefly in Germany before the war, has been commenced in France.

There are numerous recipes both for the rubber compound and for the liquids utilized to produce the spongy effect by liberating gases during vulcanization that form bubbles of uniform size distributed equally throughout the mass. One of the best compounds follows: Para rubber, 460 parts by weight; golden sulphuret of antimony, containing 2 per cent of free sulphur, 60 parts; washed chalk, 90 parts; lime, 1 part; sulphur, 30 parts; carbonate of magnesia, 20 parts; lithopone, 150 parts; zinc white, 79 parts; barium sulphate, 40 parts; wheat starch, 40 parts; olive oil, 15 parts; castor oil, 15 parts.

The rubber is worked between slightly warmed rollers for four to five hours to render it quite soft. Mixing takes an hour, as follows: the softened rubber is first treated with the mixed oils added in small quantities, then the starch is added, next the intimately mixed ingredients and finally the sulphur constituents.

The liquid for causing the formation of bubbles is composed of 90 per cent alcohol, 120 parts; aniline blue, 1 part; amyl acetate, 2 parts. The mixer rolls are kept well cooled and run slowly to reduce loss by volatilization, the liquid being sprinkled on the mass by degrees. If added too quickly the liquid does not become intimately incorporated with the mass. About 40 to 45 minutes is the average time required. The mixing rolls are set close together and later the distance is gradually increased. Air bubbles must not be allowed to occur in the mixture or unduly large cavities will be formed thereby during vulcanization.

The mass is next made up into rectangular cakes about 1½ by 1¼ by 2¼ inches in a press, the dimensions being such that the cakes do not come in contact with the walls of the vulcanizer. The thickness of the cakes is important. If too thick, vulcanization may be imperfect; if too thin, an overcure may result. The forming press must be kept cool and the cakes vulcanized at once on removal from it. The upper surface of the cake is wiped with benzine and painted over lightly with oil, while the lower is merely oiled and the sides covered with silk paper.

The vulcanizer is of rectangular section and jacketed for steam, which is admitted at a pressure of 65 to 70 pounds per square inch for fifteen minutes before vulcanization is begun. The cake is then laid on a piece of wire gauze in the vulcanizer and covered with a light cotton fabric. Vulcanizing time and conditions must be ascertained by practical experience. Steam must not be allowed to come in direct contact with the cake.

AMERICAN METHOD.

In general, American practice in the manufacture of rubber sponge follows that recorded above. It was developed first in the laboratory of The B. F. Goodrich Co. at Akron, Ohio, shortly following the appearance of the first commercial rubber sponge which originated in Russia in 1897.

It is found advantageous to set aside the rubber sponge mixing to age for several days; even as long as a week or ten days does no harm. The inflating material commonly used is carbonate of ammonium in powder form.

In preparation for vulcanization the stock is run out by a tubing machine in the form of a bar of appropriate cross-section to inflate to the thickness of sponge desired. The raw stock is cut approximately one-third the bulk of the cured product and laid in an aluminum trough for curing in open steam.

Before vulcanization is begun the heater is charged with air at 45 pounds' pressure, which pressure is subsequently gradually displaced with steam pressure, to be later still displaced by air pressure under which the cured sponge is held until cooled sufficiently to obviate all danger of internal splitting.

As soon as removed from the vulcanizer the thin skin or surface of the bar of spongy rubber is promptly broken to prevent damage by excess internal pressure. The walls of the sponge cavities are systematically broken by passage of the cured bar of sponge through an ordinary clothes wringer. This establishes connection with the outer air throughout the mass and renders the finished sponge light and absorbent.

The sponge is completed by cutting it from the cured rough form by means of a hand cutting die, after which the outer skin or surface rubber is removed by a machine knife with rapidly revolving blades somewhat after the style of a lawnmower blade. By properly housing the blade of such a cutter it is possible to remove the surface from the sponge by simply passing it lightly over a suitable opening which permits the blade to come into contact with the rubber.

THE GERMAN RUBBER MARKET.

IN AN ARTICLE on the development of a German rubber market, the "Gumm-Zeitung" comments on the experiences of the German rubber industry during the war. German's rubber industry in the year 1913 worked up in round numbers 16,000 tons of rubber, of which a third was exported in the form of rubber goods. During the war as time went on the boundaries were closed more and more to the importation of rubber. If the industry in spite of the steadily increasing demands of the army was able to satisfy them, this was due to three circumstances:

(1) Certainly hitherto no substitute material had been found which in any degree possesses the quality of natural rubber and could compete with it, but certain materials have value as helping Para rubber as additions and their use in special cases will continue even after the war. Still, when great demands are made on the materials they cannot take the place of new rubber. In other cases the Germans set aside rubber entirely and used other materials in its stead (as in the case of elastic metal tires).

(2) The working up of old rubber was improved and for this reason we may expect in the future a saving in rubber, as we have not yet got the ideal regeneration process and for good material we must in the future turn to new rubber.

(3) An important part in the German rubber economy was played by synthetic rubber, which was prepared in the last year of the war to the amount of 2,000 tons. This is the methyl rubber of the color factory formerly Friedrich Bayer & Co. in Leverkusen, which to be sure can be properly used in hard rubber goods only. But during the war they have succeeded in making progress in the preliminary for the manufacture of better kinds of artificial rubber. They have learned to prepare acetone out of calcium carbide and further isoprene out of acetone and setacetylene. There is no doubt that German science working on a scientific basis will become master of the difficulties in case it has an inducement to continue on the way it had entered upon.

What seems to be the future of the rubber market? In answering this question we must consider that the production of rubber and still more the consumption of rubber is very extensible. If there is a shortage of rubber and prices rise, the plantations can increase their tapping and all sources of rubber which are stopped up now by low prices will flow again. The consumption can be easily limited by substitute and the increased preparation of old rubber. On the other hand, if the market is flooded the plantations can limit their production and a few wild rubbers like the African will be more or less driven out while the consumption on account of the many ways in which rubber can be utilized will quickly increase. These means of regulating will apparently give the rubber market a certain steadiness.

Variations in price and surprises such as marked the period of the rubber crisis of 1913 may for the present be disregarded. Thus, in the rubber market in London in the first half-year of 1919, prices are steadily held to the line of development around

2 shillings a pound for first latex crepe. This price leaves to the plantations in so far as they are not overcapitalized, a good profit, for the cost of production is only from $\frac{1}{2}$ to 1 shilling a pound. The production for coming years is estimated at 300,000 tons for 1919 and 340,000 tons for 1920. The consumption, too, should increase in proportion since without considering the possibilities for new means of utilizing rubber, a greater extension of the automobile industry as well as of airplanes and balloons is to be expected.

Germany possessed before the war an important market for middle-class rubber in Hamburg. Since 1911 the future business in actual goods had become possible and it was planned to extend the market by establishing a time exchange for rubber. It is impossible to continue these efforts on account of the lack of money and ships in Germany will have to turn to foreign markets for the supply of its rubber needs. Probably England will be ready to deliver the crude material under favorable and easy terms the more because there is rather an abundance than a lack of it.

The London market will be strengthened in its contest with New York if the Central Powers could be counted on as customers. On the other hand, too harsh conditions would drive German buyers to other markets like Amsterdam, Antwerp and especially New York and to the further perfection of the working up of old rubber, rubber substitutes and artificial rubber.

A RUBBER SUNDRIES ASSOCIATION.

The Central Union of the German Surgical Rubber Goods Trade was formed on October 11, 1919, at Frankfurt am Main. It includes three sections: wholesale dealers, retail dealers, and exporters, and hopes to take in all firms engaged in the business. The president is A. Ederheimer, of the house of Gebrüder Weil in Frankfurt, and the manager is Dr. Ernst Mosbacher, also of Frankfurt. The office is at 42 Hochstrasse in that city.

BELGIUM'S RUBBER COMMERCE.

BELGIUM IN THE FIRST SEVEN MONTHS OF 1919 IMPORTED 5,525,715 pounds of rubber valued at \$2,877,084 at normal exchange, and exported 244,196 pounds worth \$175,096. She also imported rubber tires valued at \$2,580,153, and other manufactured rubber goods valued at \$720,018.

ANTWERP RUBBER AUCTIONS RESUME.

Proof that the Antwerp rubber market is once more in full swing is shown by the list of lots sold at auction by the well known commission house, Grisar & Cie., on November 11, Armistice Day. They amounted to 1,415 tons of Congo rubber of all grades, with a small quantity of other African rubbers and were offered chiefly by the noted firms, Société Coloniale Anversoise, Bungé & Cie. and Crédit Colonial & Commercial, which was formerly L. & W. van der Velde, with a few lots from Osterrieth & Cie. and Willaert Frères. The bulk of the rubber is made up of red Congo Kassai and upper Congo, équateur black and red, though a little lower Congo appears. The quality indicated by the valuation ranges from 2.75 francs to 5.70 francs a kilogram, but for the great mass of the rubber ranges between a little below and a little above 4.50 francs a kilogram, or around 40 cents a pound.

RUSSIAN RUBBER FACTORIES AT WORK.

At the present time three of the national rubber factories of Russia, formerly known as the Treugólnik, the "Bogatyr" undertaking and the "Kautschuk," are actually working and turning out mechanical rubber goods. They have received extensive and firm orders from the railways, the sugar industry, the Commission of Health and other services. Their stock of raw material will presumably suffice them for one year on a severely restricted scale.

The position as regards fuel is bad. The "Treugólnik" factory

has had its stock of fuel commandeered by other works, such as the electrical power station. In this large factory, intended to employ 18,000 workers, there are now only 4,500. Rubber is being used for shoe soles as a substitute for leather.

THE RUBBER TRADE IN AUSTRALIA.

Special Correspondence

RUBBER MANUFACTURE in this part of the world is steadily increasing its output and broadening its market. There are three rubber factories in Australia and these are in a very satisfactory position financially, and in regard to the quality of their goods and the standard of their output.

The pioneer is the Barnett Glass Rubber Co., the year of whose formation dates back to the 'seventies. It is to-day in a healthy condition, testifying to the perseverance of Mr. Barnett

THE BARNETT GLASS RUBBER CO., LIMITED, MELBOURNE.

Glass, the founder, and his coworkers, through the many vicissitudes that have been the lot of the rubber industry here in Australia. While the Barnett Glass company was making a beginning in manufacturing waterproof goods the Perdreau Co., as rubber merchants in Sydney and soon after as an incipient manufacturer in Melbourne, was also helping to start the rubber industries of Australia.

The Dunlop Co. of Australia, which had its inception in Melbourne as an agency of the British Dunlop company in the late 'nineties, also began to manufacture on a small scale. Its factory last year employed 3,500 hands, imported 70 tons of rubber a month, and turned out more than a thousand different kinds of rubber goods. Tires are of most importance, as is the case with all the Australian manufacturers, and the company also makes a special conveyor-belt.

It has been the desire of manufacturers here to supply, regardless of expense and inconvenience, any rubber article that the market may demand, and in this they have been successful. At the outbreak of the war they readily came to the country's aid and accommodated themselves to making the particular rubber goods necessary for carrying on the war. The result was that the Department of Defense has no anxiety regarding these articles and were sure that any demand would be supplied.

The use of plantation rubber is being largely extended here, and satisfactory results are obtained. The need for scientific research is fully recognized by manufacturers, and in order to be in position to manufacture any of the many rubber articles in existence it is obvious that much experimental work is necessary.

The lot of the rubber manufacturers in Australia is not an easy one, for difficulties and obstacles are many. The characteristic resourcefulness, determination and enterprise of the Australian manufacturer was never called into play more than in the establishment and successful carrying on of the industry. One of the handicaps is that the home market is limited, making the initial cost so great that a long interval must elapse before a reasonable profit is obtained. Added to this is the distance from the continent whence the raw products must be obtained, and the high price of labor. These factors make competition with importers difficult and the exportation to other countries scarcely possible.

Congo Rubber a Big Asset of Belgium.

By S. P. Verner

HER CONGO COLONY may become one of the most valuable assets of Belgium in her efforts to rebuild her once flourishing trade and industry. The chief point to be observed by the Belgian Government in its colonial policy is to conserve and develop the labor of the natives. Failure to do this was the weak point in the old régime ten years ago, but now King Albert may be expected to inaugurate a system which will correct past mistakes and make Belgium's big African territory a source of wealth to both Belgium and the natives of the Congo.

The principal needs of the Congo are three: an adequate sanitary service; the raising of food supplies; and the development of special industries whose products are so valuable as to be profitable notwithstanding the great distance of the Congo from the markets of the world.

Rubber, ivory, minerals and oils are the four chief industries in the Congo which will bear the expense of transportation and still yield good profits. Of these, rubber is one of the most immediately valuable. The old system of rubber collection by the natives yielded large profits, but it led to certain results which damaged the industry. The natives were willing enough to gather rubber at first, and they went into the business to the extent that more than \$10,000,000 of rubber per annum was produced in King Leopold's day.

But the African natives could not eat rubber. Agents of King Leopold's government and of the commercial companies in which he was largely interested did not always appreciate the fact that they might easily kill the goose that laid the golden egg, or rather the African, whose labor produced the precious caoutchouc, when they insisted that the natives turn from agricultural pursuits to gathering wild rubber to such an extent that famine resulted in many districts.

When the rubber buyers began to bring pressure to bear on the natives to go into the forests and get rubber, the white traders did not bring food supplies into the country, but vaguely supposed that the greatest abundance of food was available locally. This was true in some districts where there was a sufficient number of unemployed natives to enable the rubber business to be carried on without interfering with food production. But in other districts this was not the case, and an American explorer chanced to see what happened to some Congo tribesmen while they were engaged in catching and smoking fish,

upon which several villages were accustomed to subsist from one season to another.

One day, at the height of the fish curing season, a message came from one of King Leopold's officials, ignorant of local conditions, ordering the men engaged in this business to come immediately to his post in order to carry cargo for a rubber buying expedition into the interior. This meant the abandonment of the fish curing, since no compromise was entertained by which some of the men might be left to carry on the work. In fact, the order included a large number of women, who had to go to carry food supplies and camp equipment for the use of the men on the trip.

The result was that the whole population of several villages was limited to one month's supply of food, whereas, but for the interruption, a year's supply would have been secured in another month. When the porters returned after a three months' trip, they brought back cloth, sea-shells and beads with which they had been paid for their work, but there being no supply of food in the country, these articles were useless, except by making a long journey to a distant region where they might barter them for food.

Such a practice caused many of the revolts which led to wars and suffering, caused the decline of the population, made very much less labor available for the rubber industry, and caused many of the white men to be cordially hated. A more intelligent policy, without necessitating the expenditure of any more capital would have avoided this, and have increased the output of the rubber.

Rubber gathering in the Congo was both fascinating and exciting to the natives, and not by any means unpopular if properly managed, as in the earlier days of the African rubber industry. The

TAPPING LANDOLPHIA VINES.

fascinating part of the business consisted in the incidental pleasures of the chase and of camping out. Young men from a village on the African plains would pack up their belongings, march to the heavy forests along the river courses, and seek for a place where the rubber vines grew in abundance. Sometimes such a locality would be forty or fifty miles away from their homes, and it would take two or three days to get there. Then they would first put up rough palm-thatched huts, start their camp fires, and hold a religious meeting in which the medicine men would bless the undertaking, curse all their enemies, two-footed and four-footed, and see that each man had his fetish in working order. The rubber gatherers would then scatter

through the woods on a roughly prearranged plan, generally about four to each group.

The three commonest sources of rubber in the Congo are the *Landolphia Oxariensis* vine, which produces red rubber; *Landolphia Klainei*, which produces black rubber, and a tree, the *Funtumia elastica*, which also produces black rubber. Of these, the first is the most valuable and furnishes the bulk of the Congo rubber. Some of the large *Landolphia* vines grow to a

RUBBER GATHERERS' CAMP.

thickness at the bottom of 18 inches and are 200 feet long. They clamber over the tallest trees in the forest, making big loops and festoons, and they produce a fruit as large as a man's head, the seeds of the fruit being coated with a thick, gummy substance which is sweet and eaten freely by the natives. A vine of this size is a veritable veteran of the forest, and is not often found, though in places where it is abundant, such big vines may sometimes be found to the number of fifty to the square mile. Smaller vines occur more frequently, and thirty or forty of them to the acre is a fair estimate.

When the *Landolphia* is tapped, the juice oozes out slowly in a white, milky shape, and coagulates quickly upon exposure to the air. The slow bleeding of the vine is an extremely valuable characteristic of *Landolphia*, as the rubber coagulates on the bark and does not fall on the ground, unless the cut be too large and deep. Many other rubber plants must have vessels attached to them or placed under them to catch the rapidly flowing juice, and this increases the expense of collection. With the *Landolphia*, a slit under the bark six inches long and two inches wide will allow the juice to ooze out slowly, and if the slit be made in the afternoon, by the next morning a solid chunk of rubber may be detached and pulled out of the wound.

Such big vines as that just described might produce ten pounds of rubber per year without being seriously injured. The smaller vines produce in proportion. It may be said in general that five per cent of the weight of a *Landolphia* vine is rubber, though, of course, this rule is subject to many conditions. The black rubber has to be collected in vessels or in containers made of large leaves, and coagulated by heat or the use of the acid juice of certain plants.

The quantity of rubber which one man can collect varies enormously according to locality and the conditions, but on the average a native who spends the dry season of about five months collecting rubber might be expected to return with 100 pounds, worth between \$75 and \$300, according to the state of the market in Europe or the United States. He would get between \$15 and \$60 for it from the traders in the Congo. This looks like ridiculously poor pay for the natives, but it must be

remembered that, at least in the early days of the trade, the rubber gatherers spent much of their time hunting game, and regarded the rubber as pin money.

An American explorer once accompanied one of these expeditions into the forest and made the experiment of personally supervising the collection of the rubber for a week in order to form an idea of the maximum capacity of native labor and of the rubber resources of the forest, if the work were done on a thorough business basis, eliminating all other forms of occupation. He found that under this system a native in a fairly good locality might collect three pounds of rubber a day on the average. He also estimated that all the heavy expenses of transportation from the Congo to Europe, the overhead charges, and other expenses might be made with a profit of 30 per cent to the business, if the natives were paid 30 per cent of the European market value of the rubber. On this basis, at the price of \$2 a pound for red rubber, the natives could be paid as high as \$2 a day for their labor in the forest. Such wages, of course, were never obtained by the natives, but the excess profits were taken by the rubber company. At one time a fierce régime of competition set up in the Congo, that raised the rates of pay of the rubber gatherers to a high figure, but this was soon eliminated by the formation of large rubber trusts.

While rubber gathering on the voluntary system and stimulated by decent commercial methods was often a veritable picnic to the natives, the sort prompted by force, directly or indirectly, became the cause of great misery and suffering. For example, under King Leopold's régime, a government official might count noses in a village and give an arbitrary order to the native chief that the village must produce a certain quantity of rubber annually under penalty of heavy fines or imprisonment. The government officials rarely took the trouble to inform themselves specifically about the conditions under which specified amounts of rubber would have to be collected. They

FOREST OF "LANDOLPHIA" VINES.

did nothing to render the work easy, but simply issued their orders and then punished the people if the required amount of rubber was not forthcoming.

If the village endeavored to comply, it often meant that every man, woman and child over eight years old would have to move into the depths of the forest and gather rubber nearly all the year. This meant the abandonment of their fields and farms, upon which their livelihood depended; as the traders did not give them food in exchange for their rubber, and as all the

other villages were in the same situation, it meant famine in every district in which this system obtained. Besides this, the life in the forests, while pleasant enough to selected groups of vigorous young men for a certain length of time, is dangerous

RUBBER MADE INTO CAKES AFTER BOILING.

and unhealthy in the rainy season, and is unsuited to permanent residence at any time.

Peremptory orders of this sort were also resented by many of the powerful chieftains, and led to wars in which the savage soldiers would be employed against rebellious natives with all the horrors of that sort of warfare, and with many instances of actual cannibalism.

Such measures were totally unnecessary in order that white men engaged in business in the Congo might make handsome profits. The natives are able to live very cheaply because of the fertility of the soil and the tropical climate, so that only a small percentage of their time is necessary to raise food and other supplies that they need. A wise system which would set

THE CONGO RAILWAY AT CIEAS

aside definitely a certain time every year for the raising of crops and always maintaining a wise balance between the labor devoted to self-support and to obtaining rubber would avoid all of the evils of the old régime, and cause the country to enjoy an immense prosperity.

For example, one might take the case of a town of 5,000 people living at the head waters of the Kassai river at Wissman falls, with which the writer is personally acquainted. This village is situated on an elevated plateau within ten miles of a forest fifteen miles wide and several hundred miles in length, rich in rubber. This village could raise food supplies enough for the whole population with the labor of one-third of the population, while another third would be available for rubber gathering in the dry season and for such general industrial purposes as might be developed under white stimulus and direction during the rainy season. The town might produce under such an arrangement at least 100 tons of rubber per year, worth \$200,000. The imported cloth, steel, iron and other articles which the natives would obtain with this rubber would increase the wealth and comfort of the town, meanwhile the remaining third of the population might still be engaged in agriculture, and, under white superintendents, in building roads, constructing better houses, operating saw mills, etc.

If the entire French and Belgian Congo were organized upon some such basis as this, at least \$75,000,000 worth of rubber could be produced per annum.

STANDARDIZING PLANTATION METHODS.

From the fact that there has been very little change in methods of cultivation, tapping and preparation of rubber in the last few years, "The India-Rubber Journal" thinks that plantation operations have become standardized.

Even tapping operations have become more uniform; on most estates the quarter or third section system is used, one cut per tree. Frequency of tapping still varies in different countries and districts, but is usually either once a day or on alternate days. Many of the older systems have practically disappeared; "we used to hear of the half-spiral, full spiral, half herring bone, full herring bone, V, inverted V, basal and ladder tapping." The whole tendency is now towards economical bark consumption, and one cut per tree, instead of three or more, is the usual practice. As the trees grow bigger, to a girth of 50 inches or more, two cuts per tree will probably be the fashion.

The question of the number of trees to the acre is also being settled, a maximum of 80 trees with a minimum of 40 trees per acre being the ideal striven for, instead of 100 trees or more an acre.

In the factories, acetic acid is practically the only coagulating agent used, and hundreds of estates are using the same types of machinery and methods of curing for their smoked sheets and crêpe.

ALDENS' SUCCESSORS, LIMITED, IN THE FAR EAST.

Aldens' Successors (Eastern), Limited, Penang and Singapore, as of October 1, 1919, took over the business established in 1917 by R. F. Bradford as eastern representative of Aldens' Successors, Limited, of London, and incorporated with the following board of directors: A. G. Gumpert, London; Willy Friling, Antwerp; William H. Hildreth, London; E. Stevenson, London, and R. F. Bradford, Singapore, managing director. The business will be mainly in rubber and produce and an office has been opened at No. 4 Collyer Quay, Singapore, under the direction of Mr. Bradford. The Penang office will be in charge of F. D. Thompson.

PROPERTY OF THE SOCIÉTÉ FINANCIÈRE DIVIDED.

A partition of property has been made between the two corporations into which the Société Financière des Caoutchoucs has split; the French group, which retains the old name, will control the two plantations in Java, the eight in Sumatra and two in the Malay peninsula, while the Belgian group, the new S. I. P. E. F. (Société de Plantations et de Finances) will keep five plantations in the Federated Malay States.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED OCTOBER 7, 1919.

- N**O. 1,317,831. Tire structure. J. G. Smith, assignor of $\frac{1}{2}$ each to O. N. Barnett and L. C. Banner, all of Port Arthur, Tex. 1,317,839. Syringe. G. J. L. Vermont, Flint, Mich.
 1,317,851. Syringe. F. R. Arnett, Philadelphia, Pa.
 1,317,928. Combined suspender and brace. A. I. Lohar, New York City.
 1,317,947. Respirator. W. Soldering, New York City.
 1,317,970. Sadrin wax pad. G. E. Gaver, Baltimore, Md.
 1,317,976. Butt-end inner tube. J. F. Howler, assignor to the Firestone Tire & Rubber Co., both of Akron, O. (Renewed August 15, 1919).
 1,317,978. Stocking supporter. H. Keys, Ellensburg, Wash.
 1,318,026. Tire filler. B. Tamburello, New York City.
 1,318,066. Fountain brush. C. A. Garvey, Clayton, Mo.
 1,318,077. Tire boot. G. A. Harroth, Drumright, Okla.
 1,318,095. Tire interliner. I. P. McDonald, Orange, Tex.
 1,318,119. H. B. Wallace, St. Louis, Mo.
 1,318,172. Shower-bathing apparatus. H. W. Patrick, Mansfield, O.
 1,318,270. Resilient tire. W. F. Farnsworth, Washington, D. C.
 1,318,274. Demountable rim for tires. B. F. Gowdy, Englewood, N. J.
 1,318,295. Demountable rim for tires. J. McMillan, Louisville, Ky., assignor of $\frac{1}{2}$ to C. C. Wilton, both of Glen, Ind.
 1,318,534. Demountable rim for tires. J. L. Bredar, Rock Island, Ill.
 1,318,575. Tire filler. J. L. Miller, Fort Collins, Colo.
 1,318,593. Ho-balled rubber boot or shoe. C. J. Randall, assignor to The Goodyear's Metallic Rubber Shoe Co.—both of Naugatuck, Conn.
 1,318,645. Unattached vulcanized rubber sole for boots and shoes. M. H. Clark, Peham, N. Y., assignor to Boston Rubber Shoe Co., Malden, Mass. (Continuation of application Serial No. 99,255, filed May 22, 1916, and a division of application Serial No. 107,852, filed July 6, 1916, which is a continuation of application Serial No. 878,935, filed December 24, 1914).
 1,318,652. Rubberized bathing-suit holder, with patent fastening device. J. D. Farkas, New York City.
 1,318,872. Surgical appliance. M. N. Hofstetter, New York City.
 1,318,873. Valve cap. E. E. Helt, assignor to Holt Auto Devices Co.—both of Chicago, Ill.
 1,318,876. Salvaged-edge tire fabric. K. W. Jappe, assignor to The Miller Rubber Co.—both of Akron, O.
 1,318,885. Cap for fountain syringes, etc. H. P. Kraft, Brooklyn, N. Y., and M. C. Seidenberg, West Hoboken, N. J.
 1,318,911. Nipple for nursing bottles and holder for same. A. Pfommer, Philadelphia, Pa.
 1,318,917. Cap for inflating valves. E. E. Poston, Campbell, Calif.

ISSUED OCTOBER 21, 1919.

- 1,319,110. Tire construction of fabric and rubber, reinforced with spring bands. J. W. Taylor, assignor of $\frac{1}{2}$ to H. T. Miller—both of Henryetta, Okla.
 1,319,155. Dust cap for tire valve, etc. H. P. Kraft, Ridgewood, N. Y.
 1,319,297. Device for attaching nipples, caps, etc., on containers. W. P. Limacher, Pasadena, Calif.
 1,319,337. Belt and belting with elastic core, etc. L. Heimann, assignor by mesne assignments to Live Leather Belt Co., Inc.—both of New York City.
 1,319,491. Artificial foot. J. F. Rowley, Chicago, Ill.
 1,319,539. Resilient tire. C. H. Tondeur, Canastota, N. Y.
 1,319,549. Pneumatic tire. T. W. Willerton, Bloomington, Mich.
 1,319,556. Writing instrument similar to fountain pen. E. O. Baker, Shanghai, China.
 1,319,564. Crutch and cushion tip for same. M. Bruyere, Green Bay, Wis.
 1,319,593. Fountain pen. B. Laffitte, Merida, Mexico.
 1,319,604. Hip brassiere attachment for corsets. F. C. Morse, New York City.

REISSUE.

- 14,740. Attachable heel for shoes or boots. G. Schrade, New York City. (Original No. 1,298,104, dated March 25, 1919.)

ISSUED OCTOBER 28, 1919.

- 1,319,697. Pneumatic tire. De L. Davis, Chicago, Ill.
 1,319,726. Combined pneumatic and cushion tire. H. H. Schramm, New York City.
 1,319,738. Bath-bathing head, etc. F. G. Watrous, Chicago, Ill.
 1,319,864. Cushion or solid tire and method of manufacture. J. E. Hale, assignor to The Goodyear Tire & Rubber Co.—both of Akron, O.
 1,319,865. Reinforced cushion tire. J. E. Hale, and E. F. Brunner, assignors to The Goodyear Tire & Rubber Co.—all of Akron, O.
 1,319,895. Safety tread for stairs, etc. W. R. Ormes, Waltham, assignor to Universal Safety Tread Co., Boston—both of Massachusetts.
 1,319,991. Tire-holding means, including rubber band. I. T. Clark, Provo, Utah.
 1,320,025. Pad for bicycle pedals. T. R. Palmer, Erie, Pa.
 1,320,104. Demountable rim for tires. B. Tamburello, New York City.
 1,320,105. Truss with inflatable pad. E. R. Toll, Yakima, Wash.
 1,320,207. Hose supporters. W. W. Olson, Jacksonville, Fla.
 1,320,221. Non-pneumatic rubber ball and process of manufacture. K. Fukuda, Tokio, Japan.
 1,320,286. Vaenaal syringe. F. A. Stanton, Chicago, Ill.
 1,320,304. Pneumatic tire. J. B. Zimlars, San Francisco, Calif.
 1,320,364. Arch support. S. H. Boone, Chicago, Ill. G. T. Kimmel, administrator of said Boone, deceased.

THE DOMINION OF CANADA.

ISSUED OCTOBER 7, 1919.

- 193,450. Tube for pneumatic tires, having rim side reinforced with embedded fabric strips, emitting longitudinal transverse and diagonal expansion. A. F. Henderson, Toronto, Ont.
 193,451. Tube for pneumatic tires, having rims side reinforced with embedded fabric strips, emitting transverse and longitudinal expansion. A. F. Henderson, Toronto, Ont.
 193,510. Supersynony bandage with adjustable elastic straps. A. R. Chisholm, New York City, U. S. A.
 193,527. Spring tire. T. Salari, Bisbee, Ariz., U. S. A.

ISSUED OCTOBER 21, 1919.

- 193,567. Cushion for inner tire. J. W. and G. F. Burgess, inventors—both of Kansas City, Mo., U. S. A.
 193,579. Resilient tire divided into two parts, one inflatable. A. A. Crozier, London, England.
 193,586. Resilient tire. H. R. Davidson, Willows, Calif., U. S. A.
 193,590. Core for tires, foldable to position. R. Fukuda, Yoshida Machi, Yokohama, Japan.
 193,547. Ventilator for rubber boots, etc. J. V. Hagstrom, Hadlok, Wash., U. S. A.
 193,549. Solid rubber tire reinforced with metal and ebomite. H. L. Harding, Loughton, Essex, Eng.
 193,553. Abdominal supporter. J. L. Holt, nfe J. L. Moyer, Portland, Ore., U. S. A.
 193,554. Rubber boot reinforced with metal strips interposed between lining and outer coating. E. J. H. Hommer, Granite City, Ill., U. S. A.
 193,565. Means for fastening together a pair of rubbers, for hanging up, etc. F. J. Nelson, Hallett, Minn., U. S. A.
 193,569. Ventilator for rubber boots, etc. C. A. Patrick, Oakley, Ind., U. S. A.
 193,570. Pneumatic tire. I. E. Pickett, St. Louis, Mo., U. S. A.
 193,578. Rubber cushion tire. T. C. Watkins, Ingram, Pa., U. S. A.
 193,400. Cushion tire. The K. & C. Tire & Rubber Corp., Roanoke, Va., assignors of L. Van Ness, Akron, O., and F. A. Krummark, of said Roanoke—both in U. S. A.

ISSUED OCTOBER 28, 1919.

- 193,433. Pneumatic tire with metal rim. D. Stutely, Laughton, and G. W. Shavers, Friedens, inventors—both in Pennsylvania, U. S. A.
 193,434. Spring tire. J. J. Kelarek and P. Duback, inventors both of Crosby, Tex., U. S. A.
 193,451. Compressed inner tube for pneumatic tires. N. C. Doss, Atlanta, Ga., U. S. A.
 193,463. Spring tire. H. V. Higginson, Inkerman, Ont.
 193,471. Inner tube. L. B. Jeffers, Landely, Garmarthen, Wales.
 193,475. Spring tire. E. B. Killen, London, Eng.
 193,477. Pneumatic tire. F. C. Kotze, Newark, N. J., U. S. A.
 193,490. Boot for pneumatic tires. J. J. Nichols, Davenport, Wash., U. S. A.
 193,493. Rubber heel lift. I. H. Overton, Trenton, N. J., U. S. A.
 193,540. Casing for pneumatic tires, composed of major circumferential cable in turn composed of minor cables made up of twisted strands of wire, etc. W. Leeper and H. B. Hill, assignors of $\frac{1}{2}$ interest—both of Bisbee, Ariz., U. S. A.

THE UNITED KINGDOM.

ISSUED OCTOBER 1, 1919.

- 150,364. Self-sealing tanks for petrol, etc., composed of two sheets of rubber, etc. C. A. Cleehorn, Brackenside, Woburn Sands, Bedfordshire, and Gayner Pneumatic Co., 95 Cannon street, London.
 150,441. Insulated body for holding electric liquids. H. T. Wilkinson and Wardle Engineering Co., 106 Deansgate, Manchester, Eng.
 150,472. Elastic ties for connecting top and bottom surfaces of pneumatic mattress. V. Marchais, 61 rue de Bonnel, Lyons, France.
 150,618. Blow-out match. L. P. Clark, Farnwood, N. J., U. S. A. (Not yet accepted).
 150,624. Flexible wire hose with gutta percha paper between layers, etc. P. C. Rusden, 38 Southampton Buildings, London, Eng.
 150,448. Resistor with pneumatic cushion. A. R. Moody, Richmond House, Stratford, Essex, Staffordshire.
 150,676. Respiratory apparatus. G. C. Colna, 16 Perry Road, Barnes, London.
 150,747. Baby's "comforter." F. R. Graham-Yooll, Dulham Towers, East Trinity Road, Leith, Midlothian.
 150,765. Cushion tire. H. C. Babel, Buffalo, N. Y., U. S. A.
 150,783. Bottle closure. F. Cieszkowski, Robyville, O., U. S. A.
 150,931. Tobacco pipe with separate or attached concave piece of rubber for filling pipes. H. Cooley, 206 Brownwood Road, Clapham Common, London.
 150,955. Fuel tank coverings protected by addition of sheet of rubber sponge, etc. Dunlop Rubber Co., 4 rue du Colonel Moll, Paris. (Not yet accepted).

ISSUED OCTOBER 8, 1919.

- 151,120. Resilient cushion wheel. J. M. Avery, North Texas Building, Dallas, Texas.
 151,390. Respiratory apparatus for divers or aviators. R. Watanabe, 1-2 Chomei, Kodai Cho, Koshi-shi, N. J. U. S. A.

ISSUED OCTOBER 22, 1919.

- 151,390. Respiratory apparatus for divers or aviators. R. Watanabe, 1-2 Chomei, Kodai Cho, Koshi-shi, N. J. U. S. A.

- 131,423. Pneumatic tire cover with projecting cushions. T. Dunn, 7 Woodfield avenue, Stratham Hill, London.
131,424. Rubber sole for shoes, consisting of a layer of canvas and rubber, with or without rubber heel pad, etc. O. R. Williams, Raylesdale, Stanhope Road, Darlington, Durham.

ISSUED OCTOBER 29, 1919.

- 131,672. Rubber shank stiffener reinforced with metal, etc., for boots or shoes. J. C. Parkinson, 1 Bedford street, Chorlton-upon-Medlock, Manchester, and A. T. Coker, Abington Square, Northampton.
131,734. Straps for supporting corsets from the shoulders. A. M. Dewse, 280 City Road, Sheffield.

NEW ZEALAND.

ISSUED SEPTEMBER 18, 1919.

- 42,007. Rubber sole with textile base. G. W. Bellam, Boston Lodge, Windmill Road, Ealing, and A. U. B. Ryall, Glamorgan House, Brentford, both in Middlesex, England.
42,078. Mouthpiece for milking-machine teat cup. L. H. Browne, 52 Park Road, Papanui, Christchurch.
42,017. Pneumatic tire. Berendons's Syndicaat voor Banden in Dordrecht, 16 Valeriusplein, assignee of P. E. Van Berendonck, Hotel Mille, Colonnes—both of Amsterdam, Holland.

AUSTRALIA.

To Americans.

ISSUED SEPTEMBER 2, 1919.

- 8,953. Pneumatic tire valve. M. Schweinert, New Jersey, U. S. A.
10,000. Device for walking stick, crutch, etc., with rubber spring. W. M. Follner, New York City, U. S. A.

GERMANY.

PATENTS ISSUED, WITH DATES OF APPLICATION.

- 307,049. (October 15, 1916.) Resilient tire. Wilhelm Hees, Siegen.
308,671. (March 19, 1916.) Artificial foot of hard rubber or similar material. New York-Hamburg Gummwarenfabrik Co., Hamburg.
310,944. (March 24, 1917.) Rubber patch for treads, pneumatic tires and the like. Emmy Thiele, born Mühleise, Magdeburg.
311,031. (October 31, 1916.) Resilient tire. Hermann Riesel, Hamburg.
311,049. (August 16, 1916.) Elastic tire for bicycles, motors, etc. Ernst Matern, Berlin.
311,268. (May 22, 1918.) Tire fastener, Theodore Johann Caviez, Bremen.
311,365. (November 15, 1917.) Resilient tires. George A. Krause, Munich.
311,455. (May 13, 1915.) Artificial limb, with movable joints. Johannes Wegmann, Linz am Rhein.
311,537. (November 25, 1917.) Resilient tire, Gordon Co., Dresden.
311,571. (April 6, 1917.) Pneumatic springs for vehicles. Alfred Joel et Compagnie, Zurich, Switzerland.
311,685. (March 29, 1917.) Belting, Friedrich Graf de la Rosé Garsch-Partenkirchen.
311,725. (February 27, 1918.) Injection spring, especially for one-armed persons. Christoph von Tiedemann, Lubek.
311,785. (May 22, 1918.) Resilient wheel. Carl Boldt, Rostock. (Additional to patent No. 299,530.)
311,928. (February 2, 1918.) Tire fastening. Gustav Oldermann, Berlin.
312,008. (April 24, 1917.) Resilient wheel. Johann Kolozsvary, Pressburg. (Austrian Patent, April 6, 1917.)
312,080. (November 16, 1917.) Resilient tire. Albert Klafke, Düsseldorf.
312,081. (January 19, 1918.) Spring tire. Hermann Ritter, Köln-Mulheim.
312,406. (July 17, 1918.) Tire fastener. August Aberniet, Berlin.
312,576. (June 25, 1918.) Resilient wheel. Richard Müller, Köln.
312,586. (August 6, 1918.) Resilient wheel, Fabrik J. P. Grüber, Hagen in Westphalia.
313,503. (April 20, 1918.) Artificial leg with adjustable knee. Otto Bucher, Halle on Saale.
313,646. (July 23, 1918.) Elastic bandage. Dr. Karl Lubowski, Berlin.
314,057. (January 31, 1918.) Elastic tube tire with stiff protecting rim. Erhard Jungmans, Schramberg in Württemberg.
314,175. (July 19, 1918.) Body bandage. Klara Rockland, born Fischer, Vienna.
314,227. (July 31, 1917.) Solid tires made of rubber substitutes. Carl Jung-Reinhart, Aggsbachmarkt, Lower Austria, and Anton Prestler, Vienna.
314,278. (October 17, 1917.) Resilient tire. Magda Esch, born Ruthmann, Offenbach am Main.
314,279. (November 1, 1918.) Wheel tires for automobiles, bicycles, etc. Paul Knozz, Zerbst, Anhalt.
314,377. (December 11, 1917.) Resilient tire. George Schenwald, Berlin. (February 19, 1918.) Resilient wheel tires. Aernmann and Moths, Berlin.
314,572. (June 22, 1917.) Resilient tires. Karl Weiss, Nürnberg.
314,613. (January 1, 1918.) Bandage. Alb. and E. Henkels, Langenfeld bei Elberfeld.
314,685. (August 9, 1908.) Artificial leg. Prothesis Gesellschaft für Kunstliche Glieder, Würzburg-Grombühl. (Additional to patent No. 308,021.)
315,037. (December 28, 1917.) Belting fastener. Fritz Heffner, Nürnberg.
315,157. (May 2, 1918.) Knee joint for artificial leg. Heinrich Schöne, Berlin.
315,171. (February 1, 1918.) Elastic shoe. Carl Herbrechtmeier and Friedrich Herbrecht, Bünde in Westphalia.
315,144. (May 14, 1917.) Walking stick, crutch, light-fitting device. R. G. L. Gossel, Stettin. (Additional to patent No. 304,651.)
315,888. (May 18, 1918.) Working arm for those amputated above the elbow. Hans Scherger, Vienna.
315,849. (December 15, 1917.) Knee joint. Alfred Habermann, Munich.
315,899. (November 1, 1918.) Apparatus to allow artificial knees to bend. Kalte-Hirsch, Munich.

- 316,367. (March 1, 1917.) Artificial arm for those amputated above the elbow. (Additional to patent No. 307,594.) Heinrich Troenle, Stuttgart.
316,332. (October 4, 1917.) Arrangement for applying the pneumatic tube and the tread at the same time to the wheel of a motor car or the like. Johann Wessel Brand, The Hague, Holland. (Dutch patent of August 22, 1917.)
316,471. (May 25, 1918.) Resilient tire. Wilhelm Launstein, Barnsleib.
316,472. (May 5, 1918.) Resilient tire, especially for trucks, with metal plates inserted in the rim. Alfred Pfetznauer, Munich.
316,621. (December 6, 1918.) Casing for pneumatic tires. Arthur von Loup, Breslau.
316,738. (March 14, 1918.) Tire for automobiles, trucks, etc. Hermann Frische, Frankfurt am Main.
316,976. (February 13, 1917.) Tire. Carl Schauerle, Hermsdorf bei Berlin.
316,977. (July 1, 1917.) Tire. Carl Schauerle, Hermsdorf bei Berlin.
317,114. (June 8, 1918.) Resilient tire. Walter Diesner, Lüneburg.
317,115. (September 5, 1917.) Prothesis joint that can be regulated. Bokivoj Fink, Prague.
317,286. (April 4, 1918.) Resilient tire. Franz Schenck, Altona.
317,297. (October 31, 1917.) Artificial leg with brake for knee joint.

THE FRENCH REPUBLIC.

PATENTS ISSUED, WITH DATES OF APPLICATION.

- 493,076. (June 5, 1918.) Wheel tires. W. Leeper and H. B. Hill.
493,154. (November 15, 1918.) Improvement in pneumatic tires. W. C. Petersen.
493,233. (November 22, 1918.) Repair patch for pneumatic tires. T. C. Wood.
493,277. (November 23, 1918.) Resilient wheel. N. B. Knight and L. K. Hughes.
493,678. (December 9, 1918.) Improvement in pneumatic and other tires. A. M. Poynter.
493,951. (December 17, 1918.) Rubber button for stocking fasteners. P. Puginet.
494,358. (December 28, 1918.) Automatic inflator for pneumatic tires. P. Jaboulet.
494,208. (January 12, 1917.) Improvements in the manufacture of rubber articles and like materials. T. Sloper.
494,268. (December 30, 1918.) Elastic footwear. A. Carnes, 30 Rue Beaucourt, Paris.
494,468. (January 4, 1919.) Resilient wheel for automobiles. E. Jacquemart and J. Kunkel.
494,701. (January 11, 1919.) Puncture proof pneumatic tire. M. J. Sénéchal, 25 Rue Bergère, Paris.
494,709. (January 11, 1919.) Resilient wheel. J. Duran Pinfaña.
495,190. (January 25, 1919.) Tires for vehicle wheels. J. A. Prince and A. L. Gilles.

TRADE MARKS.

THE UNITED STATES.

- N. O. 103,392. The word **LEE** above a star within a circle—golf balls, etc. Harry C. Lee & Co., New York City.
109,659. The words **BLUE STREAK**—rubber belting. The Goodyear Tire & Rubber Co., Akron, O.
110,392. The word **GOOLASTIC**—elastic bandages for personal wear. Everlastic, Inc., Boston, Mass.
112,419. The words **EVER-ITR**—rubber heels and soles. E. E. Taylor & Co., Boston, Mass.
115,221. Representation of a tire bearing the words and numerals **QUICK DETACHABLE 34 x 4 HOOD TIRE CO., INC., WATERWORTH, MASS.**, and within the tire, in white against a black background, an arrow pointing from left to right and the words **EXTRA PLY** and **HOOD TIRES**—rubber tires. Hood Tires Co., Inc., Watertown, Mass.
115,470. The word **UNARAC** within a double-outlined diamond—asbestos and rubber machinery packing. Union Asbestos & Rubber Co., Chicago, Ill.
116,002. The word **RIKSON**—rubber tires. Mead Cycle Co., Chicago, Ill.
117,730. Representation of the vessel **Mayflower**—rubber soles and heels. Mayflower Rubber Works, Inc., Braintree, Mass.
119,455. The word **NIKKEX**—varnish for coloring and coating the surface of rubber tires. The Sterling Varnish Co., Pittsburg, Pa.
119,605. The words **SEA SAFE** and the representation of an anchor—waterproof bags and purses. Theodore Hutnikow, Brooklyn, N. Y.
120,296. The word **CIRCOMAT**—rubber mats and matings. United States Tire Co., New Brunswick, N. J., and New York City.
120,732. The word **TITAN**—rubber footwear, etc. Apsley Rubber Co., Hudson, Mass.
120,734. The word **CLIMAX**—rubber footwear, etc. Apsley Rubber Co., Hudson, Mass.
120,842. The word **OMO**—gun tissue. The Omo Manufacturing Co., Middletown, Conn.
120,843. The word **OMO**, having a pair of wings spreading upward from the top points of the letter **M**—gun tissue. The Omo Manufacturing Co., Middletown, Conn.
121,677. The words **PHIL CO.**—rubber separators or retainers for battery plates—Philadelphia Storage Battery Co., Philadelphia, Pa.
25,234. Representation of seven baby heads on a ring—rubber nipples. United Drug Co., Limited, Toronto, Ont.
25,235. Representation of a druggist's mortar and pestle attached to a bar—hot-water bottles, fountain syringes, etc. United Drug Co., Limited, Toronto, Ont.
25,278. Representation of an Indian's head within a circle—vulcanized fiber. American Vulcanized Fibre Co., Wilmington, Del., U. S. A.
25,279. The words **VIT-COT**—vulcanized fiber. American Vulcanized Fibre Co., Wilmington, Del., U. S. A.
25,308. The word **SCALFLEX**—solid and solid rubber tires, tire covers, and casings, all provided with anti-skidding rubber ribs. Société Générale des Etablissements Bergougnan, Clermont-Ferrand, Puy-de-Dôme, France.

25,509. Removable and interchangeable rollers for the tire, the rollers being of rubber and the tire of metal. W. H. S. A.

NEW ZEALAND.

To Americans.

- 14,773. The use of a tire having a tread of rubber on a metal base. Taylor Instrument Cos., 95 Ames street, Rochester, N. Y., U. S. A.
- 14,780. The use of a tire having a tread of rubber on a metal base, including tubing other than tires, belts, hoses, rings, washers, packings, springs, couplings, stoppers, air-chests, bumpers, threaded, taps, nuts, valve-disks, rubber heels unattached, sheet tubing, and dredging sleeves. United States Rubber Co., 1750 Broadway, New York City, U. S. A.
- 15,157. The words AMERICAN STAR Patches and the representation of an American flag serving as an enlarged spindle core of a rubber tire. United States Rubber Co., 1750 Broadway, New York City, U. S. A.
- 15,526. Representation of cross-section of tire surrounding splicing face of automobilist with goggles on forehead, all above the word LEE—tires, inner tubes, valve patches, inner cases, hose-belt, etc. Lee Tire & Rubber Co., 245 West 55th street, New York City, U. S. A.
- 15,634. The word STAR in white-outlined black letters against a black star—pneumatic and solid tires, tire patches, liners, and retread bands. The Star Rubber Co., 1025 Sweetzer avenue, Akron, O., U. S. A.
- 15,707. The word FIRESTONE—boots, shoes, overshoes, hats, coats, etc., of rubber or material containing rubber. The Firestone Tire & Rubber Co., Akron, O., U. S. A.

THE FRENCH REPUBLIC.

To Americans.

- 26,536. The words ADAMS' CALIFORNIA FRUIT and the representation of different kinds of fruit—chewing gum, etc. American Chiclé Co., New York City, U. S. A.
- 26,537. The words ADAMS' CALIFORNIA JACK—chewing gum, etc. American Chiclé Co., New York City, U. S. A.
- 26,538. The words ADAMS' PEPIN—chewing gum, etc. American Chiclé Co., New York City, U. S. A.

AUSTRALIA.

To Americans.

- 24,006. The word CAMACHIX—machines for slitting, winding, cutting, and perforating flexible materials; also parts and accessories. Cameron Machine Co., 61 Poplar street, Brooklyn, N. Y., U. S. A. (W. J. Spruson, Daily Telegraph Buildings, King street, Sydney.)
- 24,513. Representation of a woman's head above the word Omo having a pair of wings spreading upward from the top points of the letter M—dress shields of rubber or gutta percha alone or in combination but predominating. The Omo Manufacturing Co., Middletown, Conn., U. S. A. (W. J. Spruson, Daily Telegraph Buildings, King street, Sydney.)

- 4,671. A sign. Patented October 20, 1919. Canadian Consolidated Rubber Co., Limited, Montreal, Que.

REGULATIONS GOVERNING FOREIGN TRADE MARKS.

The following is a condensed abstract of the important features of the trade-mark laws of the leading countries of the world. Manufacturers of trade-marked articles should bear in mind that in quite a number of foreign countries ownership of a trade mark is acquired only by registration, not use. Hence, an unauthorized person may register an existing trade mark in these countries, and such registration may prevent the rightful owner from afterwards using it in those countries. The importance of registration of trade marks in foreign countries is therefore evident:

Country	Term, Years	See Footnotes	Country	Term, Years	See Footnotes
Argentina	10	a c	Holland	20	c f
Australia	10	a c	Honduras	Perpetual	c f

NOTES.

(a)—Registration alone gives ownership. (b)—Ownership acquired by use without registration. (c)—Infringers cannot be sued until mark is registered. (d)—Foreigners must first register in home country. (e)—Under International Convention, citizen of any other Convention country has priority from home application if filed within four months. (f)—Registration subject to rights of prior user in such country. (g)—Registration is only prima facie evidence of ownership. (h)—Evidence of ownership after expiration of a certain period. (i)—Bolivia: Registration compulsory. (j)—China: Pending the promulgation of more satisfactory regulations, trade marks are being deposited with the Imperial Maritime Customs at Shanghai in order to secure evidence of priority of use. (k)—Egypt: No statute for registering trade marks, but applicant's claim to such is filed in the Court of First Instance of the Mixed Tribunal at Cairo. (l)—India: No special trade marks registration act exists in India, but it is customary to register a declaration of ownership of the trade mark, which registration may be adjoined as evidence in prove exclusive right to the mark. (m)—Protection secured by advertising. (From "An Export Order." (Published by the National Association of Manufacturers, New York City.)

TRADE-MARKS AND NATIONALITY.

A new provision of the British Patent Office requires each applicant for a trade-mark to declare his nationality, or, in the case of firms, that of the individual members. This declaration may be embodied in the application, in which case the applicant must sign the application personally, or, in the case of firms, each individual member must sign and make declaration. If the application is signed by an agent, the declaration may be on the authorization to the agent or on a separate form. In the case of bodies corporate, in connection with those obviously incorporated under the laws of Great Britain, no further information will be required; in all other cases, particulars of incorporation must be inserted in the application, e. g., "a company organized under the laws of France," etc.

Review of the Crude Rubber Market.

NEW YORK.

THE CRUDE RUBBER MARKET during the past month has been largely speculative, trading has been active, and there have been large offerings which were taken up as they came, but manufacturers were not as ready to buy as they were the month before. The market has run up to 54½ cents for smoked sheets and has been as low as 52, but the prices for the beginning and the end of the month are practically the same; they have been affected somewhat by the drop in exchange. There was some interest in January-1920 arrivals.

Those in a position to know are skeptical about British estimates of largely increased production of plantation rubber for 1920 and 1921 and expect rather a falling off from the figures for 1919. It is rumored that the planters in the Far East are going to take concerted action to improve their property by tapping the trees only in alternate years.

Prices for plantation and South American rubber at the beginning and toward the close of the month are shown in the following quotations:

PLANTATION HEVEA. November 1, first latex crépe, spot 54 cents, November-December 53½ cents, January-March 53¼-54 cents, January-June 53½ cents, July-December, 1920, 53¼-54 cents. November 20, spot 53 cents, futures 53½.

November 1, ribbed smoked sheets, spot 53 cents, November-December 52½ cents, January-March 53 cents, January-June 52½-53 cents, July-December, 1920, 52½-53 cents, November 20, spot 52 cents, futures 52½ cents, July-December, 1920, 52½ cents.

NOVEMBER 1, No. 1 amber crépe, spot 51 cents, futures 50 cents. November 20, spot 50½ cents.

NOVEMBER 1, clear thin brown crépe, spot 46-47 cents, January-June 47-48 cents. November 20, spot 48 cents.

NOVEMBER 1, No. 1 roll brown crépe, spot 40-41 cents, futures 39-41 cents. November 20, spot 47½ cents, futures 41 cents.

SOUTH AMERICAN PARAS AND CAUCHO. NOVEMBER 1, spot prices: upriver fine 52¼-53½ cents, islands fine 49-50 cents, upriver coarse 34-35 cents, islands coarse 22-25 cents, Cameté coarse 22-23 cents, cauchó ball 34¼-35 cents. NOVEMBER 20, spot prices: upriver fine 52 cents, islands fine 48 cents, upriver coarse 34½ cents, islands coarse 22-23 cents, Cameté coarse 24-25 cents, cauchó ball 35 cents.

RECLAIMED RUBBER.

THE IMPROVEMENT in the reclaimed rubber market, noted in the report for the month, still continues and prices on all grades are firm with upward tendency. In some lines the mills are unable to meet the demand for stock.

Most manufacturers of mechanical rubber goods are falling behind in deliveries, particularly in the lines of heavy goods, a situation attributable in part to export demand and in part to renewal and increase of equipment in domestic manufacturing and railway equipment. Automobile tire manufacturers on all sides are planning increased manufacturing facilities. The outlook is decidedly optimistic for the reclaimers.

THE MARKET FOR COMMERCIAL PAPER.

In regard to the financial situation, Albert B. Beers, broker in crude rubber and commercial paper, No. 68 William street, New York City, advises as follows:

"During November there has been a fair demand for paper, mostly from out-of-town banks, and the best rubber names have been taken at 3½ to 6 per cent and those not so well known 6¼ to 6½ per cent.

SINGAPORE RUBBER REPORT.

GUTHRIE & CO., LIMITED, Singapore, report (October 16, 1919): At the usual weekly auctions held yesterday and to-day there was a strong demand for all grades which continued throughout the sales. Fine pale crepe realized up to 96 cents (one small lot in bulk sold at 96½ cents and one lot in cases at the same figure) showing an advance on the week of 7 cents. Ribbed smoked sheet was readily taken up to 96 cents (two small lots in bulk fetching 96½ cents) showing an advance on last week of 6 cents.

Lower grades showed corresponding advances. The total quantity cataloged was 940 tons of which 866 tons were offered and 674 tons sold.

The following is the course of values:

In Singapore.		Sterling Equivalent per Pound in London.	
Sheet, fine ribbed smoked.....	93c @ 96c	2/ 4½ @ 2/ 5½	
Sheet, good ribbed smoked.....	85 @ 92½	2/ 2¼ @ 2/ 4¾	
Crepe, fine pale.....	93½ @ 93	2/ 3 @ 2/ 5	
Crepe, good pale.....	86½ @ 90	1/ 10½ @ 1/ 11½	
Crepe, fine brown.....	70 @ 74	1/ 8 @ 1/ 9½	
Crepe, good brown.....	65 @ 67½	1/ 8½ @ 1/ 9½	
Crepe, dark brown.....	62 @ 66½	1/ 8½ @ 1/ 9½	
Crepe, bark brown.....	59 @ 60	1/ 7½ @ 1/ 7¾	

¹Quoted in S. S. Currency—\$1 = \$0.567.

BATAVIA RUBBER MARKET.

HERMANS, MARSMAN & CO., Batavia, report [August 15-September 18, 1919]:

The market opened rather quiet and prices advanced until 1.21 guilders [48.4 cents] for the 100 per cent first crepe and 1.19 guilders [47.6 cents] for the smoked sheets. Suddenly a very strong demand came up which caused a heavy advance of prices for all grades. The highest price paid for the 100 per cent first crepe was about 1.45 guilders [58 cents], with one cent lower for the smoked sheets. These prices could only maintain for some days and they soon increased again. The market closed with the following quotations:

	In Batavia Per ½-Kilo.	Equivalent Per ½-Kilo in U. S. Currency.
Fine pale crepe.....	1.35	\$0.54
First pale crepe.....	1.33	.532
First pale crepe, basis 75 per cent.....	1.25	.515
Prime smoked sheets.....	1.31	.524
First smoked sheets, basis 75 per cent.....	1.23	.496

¹Quoted per ½-kilo (1.1 pounds) in Dutch Indian guilders (\$0.40).

THE MARKET FOR RUBBER SCRAP.
NEW YORK.

THE KEEPEE SCRAP MARKET CONTINUES TO SHOW NO INCREASE IN activity. Transactions in boots and shoes furnished the bulk of the business. The mechanical scrap market has been without incident in the absence of all demand on the part of reclaimers. In tires the only business has been between dealers for picking purposes and the salvage of fabric for the tire rebuilding trade. Prices in all grades of rubber scrap continue strictly nominal and there is scarcely sale for any grade.

QUOTATIONS FOR CARLOAD LOTS DELIVERED.

NOVEMBER 25, 1919.

Prices subject to change without notice.

BOOTS AND SHOES:

THE MARKET FOR COTTON AND OTHER FABRICS.
NEW YORK.

AMERICAN COTTON. In November the spot price for middling uplands cotton advanced steadily in a speculative market until the middle of the month. It had reached 38.40 cents in the last week of October and kept going up till it reached 40.20 cents on November 11, that being the highest price for the month. For a week longer it kept a shade under 40 cents until the break in the stock market, when it dropped suddenly a hundred points, falling to 38.65 cents on November 18. It then climbed up again to 39.25 cents on November 22.

EGYPTIAN COTTON. The market during November has undergone another great rise, but now seems steady for the time being. Medium to good Sakellarides is quoted at 75 to 80 cents; upper Egyptian is practically all sold and only a small supply of very high grades is available. Low grade Sakellarides is also scarce. The total crop is estimated at just under 6,250,000 cantars and though the total of Egyptian sales is larger than usual it is believed that a good deal of the cotton is in the hands of speculators.

AMERICAN-EGYPTIAN COTTON. The Egyptian from Arizona is quoted at 85 to 90 cents, with few recent sales at the higher figure. The crop estimate is now a little under 50,000 bales for the season. Ginning is progressing steadily.

SEA ISLAND COTTON is moving very slowly. The crop is so small that it is practically negligible, but average extra choice is quoted at 85 cents and both Sea Island and Arizona long staple are a little ahead of the Egyptian cotton. The Government's estimate of the Sea Island crop, 15,000 tons, seems to be too high.

LONG-STAPLE COTTON of any kind that can be used for tire fabrics has been sold to the end of 1920, so that no prices are quoted; even the supply of 1 1/4 white cotton, or peclers, is over-sold, and that is true of upper Egyptian also. Spinners of yarn are asking \$2 a pound.

TIRE FABRICS. The scarcity of long-staple cotton has practically closed the market for tire fabrics. No cord fabrics are to

he had as the supply has been sold out to the end of 1920. All grades of cotton and cotton duck used in the manufacture of pneumatics have gone up 35 to 40 per cent in the last six months and the cotton used in cord tires now costs more than the rubber. Even with inferior substitutes the demand cannot be met. Prices are nominal.

OTHER FABRICS. The excess of demand over supply holds good for other fabrics also, owing to the general shortage of the cotton crop. All supplies for next year are practically sold out, which affects the manufacture of waterproofing materials, of hose and belting, and also of sheetings and drills and ducks for 1920.

NEW YORK QUOTATIONS.

NOVEMBER, 25, 1919.

Prices subject to change without notice.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

NEW YORK.

THE ABNORMAL DEMANDS for supplies by rubber goods manufacturers and the paint industry, together with the strikes of steel makers, coal miners and longshoremen, have produced an unprecedented shortage in all lines. In practically every line products are back-ordered several months and spot stocks are extremely low.

There has been a good demand for certain earths, clays and fillers, possibly as substitutes. It has been impossible to supply some of these lines for the reason that production has been limited.

ANILINE OIL. The demand exceeds the supply. During the past month prices have advanced three cents per pound.

TIRE
FABRICSJENCKES
SPINNING
COMPANYPAWTUCKET
RHODE ISLAND

AKRON OFFICE
407 Peoples Savings & Trust
Co. Building.

BAKERS. The mills are running at approximately their maximum production, but are not able to handle orders for 1 to 4 week competition. As a result of the current trade relations are resumed.

BARS. The steel used in the manufacture of the seized output is 10 per cent of total and a vast amount of the battimous miners is not promptly terminated, production will cease. No spot steel is available.

LITHARGE. The demand very much exceeds the producing capacity and this condition may continue indefinitely.

LITHIUMSE. The demand is record breaking and certain makers have been inclined to advance prices. This tendency has, for the present, however, been overruled and the price remains steady.

SUBSIDIZED LEAD. The manufacturers report the demand out of all proportion to the supply. The price remains steady at about 8½ cents.

SULPHUR. There is a uniform demand from consumers and prices are reasonable and steady.

WHITING. The importation of chalk has been in an unsettled condition owing to British labor disturbances. For this reason the strong demand prevents accumulation of stocks.

ZINC OXIDE. The mills are operating 24 hours per day, but are unable to meet the demand, which is particularly notable on the part of makers of automobile tires. Prices remain unchanged.

NEW YORK QUOTATIONS.

FOREIGN CUSTOMS CHANGES.

BELGIUM.

RUBBER may be exported from Belgium without an export license. This ruling became effective September 19, 1915.

DENMARK.

Denmark has removed the export prohibition as regards motor vehicles complete, including covers and tires, but not that against the exportation of separate tires. Medical hand syringes and thermometers, bandaging materials and vulcanized fiber may also be exported.

FINLAND.

Finland has placed the following articles on the free list of imports: India rubber, gutta percha and balata; rubber sheets and other forms of packing; automobile tires, cycle and motor-cycle parts of rubber, pedal and brake rubbers, inner tubing and the like; India rubber shoes, including goloshes; blocks and plates of hard rubber (ebonite, etc.), even in cut shapes; pipes, strands and rods in cut shapes, knife handles and packings of hard rubber.

BULGARIA.

Bulgaria now permits the importation of rubber and gutta percha, goloshes and rubber boots, transmission belting, waterproof stuffs of any vegetable textiles and for any purpose, and auto trucks, but not automobiles without the permission of the Department of Social Insurance.

LETTLAND.

Lettland, by the tariff law of March 26-April 2, 1919, will exact ad valorem customs duties of 5 per cent on crude gum and asbestos, and 10 per cent on rubber goods.

THE NETHERLANDS.

The prohibitions have been withdrawn against the exportation from the Netherlands of rubber, waste rubber, rubber, and gutta percha and articles manufactured therefrom, with the exception of motor and cycle tires and dental rubber.

SPAIN.

The export prohibition on manufactures of rubber, imposed by an order of April 24, 1915, has been removed by the Spanish Government, but the export of crude rubber and similar materials remains prohibited. Crude rubber is being imported without difficulties and it is believed that the export of rubber manufactures should be encouraged.

JAPAN.

The export prohibition on crude rubber and rubber manufactures in Japan has been removed.

BRAZIL.

In Brazil the separate states impose export duties. The State of Bahia now exacts 9 per cent ad valorem on exports of Manga-beira and Maniçoba rubber.

GERMANY.

Germany has recently established a free import list, articles included in which may be imported without license. Among these are: rubber, raw or purified; gutta percha, raw or purified; balata, raw or purified; rubber, gutta percha and balata scrap; worn out pieces of rubber; gutta percha and balata articles; asbestos fiber and refined asbestos; raw and ground asbestos.

CZECHO-SLOVAKIA.

Czecho-Slovakia grants general licenses for the importation of crude rubber and of rubber and vulcanite goods, technical and surgical. The country is in urgent need of pneumatic tires, fire hose and other rubber goods.

ALUM PROHIBITED AS COAGULANT.

Alum is forbidden as a coagulant of rubber latex by the administrative officers of Perak, Selangor, Negri Sembilan and Pekang in the Federated Malay States. The regulation reads:

"Salts of alum and other aluminum salts shall not be used for the coagulation of *Hevea* latex or for the preparation of rubber therefrom either alone or in admixture with each other or in combination with any other substance or substances."

ADVERTISING: Rates will be made known on application.

REMITTANCES: Should always be made by bank draft. Post Office or Express money order on New York, payable to THE INDIA RUBBER PUBLISHING COMPANY. Remittances for foreign subscriptions should be sent by International Postal Order, payable as above.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

TABLE OF CONTENTS ON LAST PAGE OF READING.*New Year's Greetings!*

A HAPPY NEW YEAR and a prosperous one!
May all of our friends here and abroad have the good luck to wish wisely and their wishes be realized. Thus the rich promise of this new year, to our industry and to the world, will be fulfilled.

THE INDUSTRIAL RELATIONS COMMITTEE.

IT IS NO EXAGGERATION to state that as a whole, rubber workers are better paid, housed and looked after than laborers of any other great industry. This has been done wholly through the initiative of individual companies. This will continue without a doubt, but it is to be aided and strengthened by collective effort. This is forecast by the formation of an Industrial Relations Committee consisting of twenty-five firm members of The Rubber Association of America. The getting together of the great manufacturers for the purpose of exchanging views should be of the greatest benefit to employer and employee.

AMERICAN RUBBER PLANTATIONS IN MEXICO.

NOT LONG AGO there were 150 rubber plantations in Mexico, some of them very important undertakings. They were owned by American companies with headquarters in every important city from New York to San Francisco and from St. Louis to Chicago. They owned hundreds of thousands of acres of land, buildings, machinery—the best of equipment. They had cleared and planted great areas to rubber, coffee, cane and foodstuffs. They employed large forces of natives whom they housed, fed and paid well.

To-day, that whole industry has been destroyed, the buildings looted and burned, the plantations given over to the jungle, the laborers scattered. Furthermore the American superintendents and foremen, such as were not slain, have been driven from the country. And so far there seems to be no redress.

LABOR FAMINE NOT TO BE FEARED.

FROM MANY WELL-INFORMED SOURCES evidence is accumulating that manufacturers, business men, bankers and others fear a labor shortage. The era of spending that reached its climax during the Christmas holidays indicated a feeling on the part of laboring men that money is very plenty, that big wages are to continue, and their jobs secure.

The American Bankers' Association affirms that an alarming proportion of our 14,000,000 foreign born are drawing money from the banks, selling Liberty Bonds and houses and are preparing to return to Europe. The estimate made is that \$4,000,000,000 will be carried away by the 1,500,000 workers who are leaving for home, just when the call for workers here is most acute. It is said that in one plant employing 12,000 foreign born men, 45 per cent have signified their intention of leaving this country and the superintendent declares that should even 15 per cent leave, he would not know how to replace them.

There is this to be remembered, however. We faced the severest sort of labor famine during the war that could be imagined, and most of the factories ran. There is to-day a new force of workers in the thousands of women who found congenial and remunerative work in many industries. The United States is also better prepared to create automatic and labor saving machinery than is any country in the world.

There is also the probability of employing the plentiful and cheap labor supply of the Orient. Consider the

Chinese labor supply for instance. Already certain European publishers of books, because of the high cost of printing and binding are having their work done in China and done well and cheaply. This, of course, is because of the abundance of cheap labor. Now that there is talk and perhaps danger of a labor famine in the United States, and because of the extremely high labor wage here, will not American manufacturers look Chinaward? We are barred by law, passed in the interest of American labor, from bringing the Chinese worker here. There is no law, however, forbidding one to take the work to him. That is why American mills, perhaps rubber mills, may ere long be operated in the Flowery Kingdom. Incidentally China is very near the vast crude rubber supply of the Malay States and the Dutch Indies.

PLANTING HEVEA IN THE PHILIPPINES.

WORK is going on, steadily but slowly, in the direction of planting new rubber areas in the Philippine Islands, particularly in Mindanao, where large tracts have been cleared in the last 20 months to be planted to *Hevea*. This is chiefly the work of Dr. J. W. Strong, representing American capitalists.

There is a wonderful field for rubber plantations in the southern islands and the Department of the Interior in the Philippines would do well to discover why American capital does not come in more rapidly. If it is the fault of existing laws, surely the Filipinos will have them corrected.

"TECH'S" NEW INDUSTRIAL PLAN.

A PLAN which has been adopted by the Massachusetts Institute of Technology is destined to be of great advantage to manufacturers in general if it touches the popular key-note which is intended. In brief, it is to place at the disposal of the various industries of the country all the resources of the great Boston institution, its magnificent library, its consultant staff, experience and general knowledge, upon the payment of a certain annual fee. The advantage to industry is comprehended in the opportunity of obtaining the most skilled advice and experience in the world in solving the various technical problems which constantly arise, many of which are beyond the ken of the average consultant. The idea was advanced in connection with the appeal for the raising of funds which has been recently made. The Institute would virtually be retained by the various industries which subscribe to the plan exactly as though it were a private firm of consulting chemical engineers.

AN AMERICAN RUBBER RESERVE.

A YEAR or more ago it was seriously proposed that a reserve of crude rubber be created in the United States. It was to be held against failure of overseas crops, embargoes, or prohibitive prices. If we remem-

ber rightly, 100,000,000 pounds was deemed an amount that would be sufficient for the purpose. Of course there was the financial handicap of interest upon the investment, insurance, and deterioration, to be met and overcome, but those were mere details.

According to a report just issued by the University of California, summarized elsewhere, an even greater reserve is already established. The report, the work of Professor Harvey Monroe Hall and his colleague, Thomas Harper Goodspeed, relates to the existence of millions of pounds of "Chrysil rubber" in our western states, a supply of notable value if the present sources fail or if prices go to the \$3-mark again. Three hundred million pounds of crude rubber, which is the estimate all ready for extraction, would easily tide us over a year, in which time we could doubtless get overseas rubber again.

LOOKING AHEAD IN RUBBER.

PLANNING for the future of the rubber industry is something that manufacturers, engineers and skilled chemists are constantly doing. In the laboratories of the great rubber manufactories are men who think in rubber for years ahead. They foresee an ever increasing production of crude rubber which will make possible the fabrication of articles now undreamed of. It will after all be but history repeating itself.

The rubber fiber shoe soles came suddenly, but it was thought out long in advance of its debut. Rubber chemists and manufacturers waited for low rubber and high leather. The market was finally ready for the fiber sole, as it will be one day for other new and revolutionary rubber products.

HEAVY SERVICE TIRES.

A BRANCH of automobile tire production which is destined to increase notably in the next year or two is the manufacture of heavy tires, particularly pneumatic, for use on what is known as "freight car trucks."

Where in the past the railroad did most of the "short haul" business, to-day the truck is taking it over quietly and efficiently. As fast as usable roads are built the truck does the freighting. Motor trucks are already widely used in transporting freight from town to town and from farmer to market, and it is to the interest of all shippers to promote this method of transportation as much as possible. The motor truck solved the freight congestion problem of the railroads during the winter months of 1917 and 1918 and they are already being called upon on a much larger scale for the coming winter.

Once motor roads parallel railroads, a general railroad strike would be an impossibility, for automobiles would care for the passengers, and trucks the freight. The tire manufacturers are helping toward such preparedness to a notable degree.

Three Hundred Million Pounds of Chrysil Rubber.

THE LONG LOOKED FOR REPORT UPON rubber-bearing shrubs in western America has appeared and it is no exaggeration to say that it is one of the most complete, scholarly and practical treatises of the day. It is mainly the work of Professors Harvey Monroe Hall and Thomas Harper Goodspeed of the University of California and is entitled "A Rubber Plant Survey of Western North America," preceded by a twelve-page reprint on ecology from the year book of the Carnegie Institution for 1918.

This covers study and experiment at desert and mountain stations and through expeditions. The specific work on rubber began in 1917 when a chemical laboratory was fitted up at the Alpine Laboratory at Pike's Peak to work in conjunction with a desert laboratory and the university laboratory at Berkeley, California. Here 18 genera and 30 species were examined chemically. These were largely latex plants. Rubber was found in 25 of the species examined, but in most it was too minute in quantity to be important. In 11 the percentage was enough to

varietal names. Part 2, relating to the product of the *C. nauscosus*, which is well named Chrysil rubber, will appeal to the rubber manufacturer, just as Part 1 appeals to the botanist.

Very wisely, at the beginning, 25 pounds of the shrub was sent to Dr. David Spence to get an idea of the value of the rubber. His report was that the rubber was of "high grade and average quality, not as good as the best fine Pará, but a great deal better than most Africans or low grade rubbers."

The *Chrysothamnus*, or "rabbit brush," is very widely distributed. The investigators found that "they range in altitude from about sea level in some of the desert basins to 8,000 feet in the southern Colorado mountains. Some varieties occur at even higher altitudes, but they have not been examined as to their rubber content. The plants are most abundant and of maximum size in the Great Basin area, becoming more and more scattered and apparently diminishing in their percentage of rubber as we pass from this center of distribution. The most northerly points from which we have taken samples for analysis are in eastern

VIEW OF BENTON HILLS, CALIFORNIA, WHERE ONE OF THE EXPERIMENTAL TRACTS OF *CHRYSOETHAMNUS* WAS LOCATED. HARPORETT'S WAS ALSO FOUND AMONG THE ROCKS MIDWAY UP THE HILLS.

call for further work and in 4 it was high enough to warrant the hope that the species may serve for the production of rubber on a commercial scale.

The main report apart from the folder on ecology is divided into three parts:

- (1.) The *Chrysothamnus nauscosus*, by Professor Hall,
- (2.) Chrysil, a new rubber from *Chrysothamnus nauscosus*, by Professors Hall and Goodspeed,
- (3.) The occurrence of rubber in certain West-American shrubs, by Professors Hall and Goodspeed.

In the first part, Professor Hall, after a brief general description of the *Chrysothamnus*, presents a key to the sections of *Chrysothamnus* which he assembles in five natural groups. Of these the *C. nauscosus* is the one he selects as containing rubber in sufficient quantity to be interesting. Next comes a key to the varieties of *C. nauscosus*, followed by a synopsis of the varieties. This latter is a complete botanical description of 22 varieties, with extended notes covering occurrence, habitat, etc. This part closes with a very valuable index of specific and

Oregon (Redmond, Burns, etc.), eastern Washington (Spokane), southern Idaho, and southern Wyoming (Rawlins, Laramie). The best samples carried only three per cent of rubber and most of them ran less than two per cent. The easterly limits of the genus are reached in South Dakota and western Nebraska; the southerly limits, in western Texas, southern New Mexico, and southern Arizona, with some possible extensions into Mexico, or at least into Lower California. On the Pacific Coast we find scattered groups of the plants as far west as the Coast Range mountains; for example, San Benito County, Mt. Hamilton, Lake County, Trinity County, etc."

A very interesting estimate of what may be expected as to extracted product is as follows:

Districts	Pounds.
No. 1—East Central California and adjacent Nevada	400,000
No. 2—Moist desert California and adjacent Nevada and Oregon	1,670,000
No. 3—Northwestern California and adjacent Nevada and Oregon	7,680,000
No. 4—West Central Nevada	23,700,000
No. 5—Northern and Central Nevada	20,000,000
No. 6—Utah	21,800,000
No. 7—Colorado	21,800,000

In addition to this there are numerous other extensive and unexplored regions where large amounts of rubber-bearing shrubs can be found. The most promising of these is Wyoming, and there are also considerable areas in southern Montana, in Idaho and in eastern Washington. This total of approximately 80,000,000 pounds can be increased by 50 per cent by allowing for other districts in these regions which were not explored, and that with the other regions mentioned would bring the total well up to 300,000,000 pounds.

It should be noted by the way that the *Chrysothamnus* is not a latex producing plant. The rubber is found in the individual cells of the shrub, as in guayule. Like guayule also it is found principally in the parenchymatous elements of the cortex. It may also be noted that rubber does not appear to be laid down during the first year of growth of a tissue, and, indeed, unless present in large amount, is not readily detected by the histological method in portions of the plant less than three or four years old.

Shrubs of interest as possible rubber producers are usually of good size, measuring three to eight feet high and about as broad. The rubber is present for the most part in the inner bark of the stems, and those portions in average mature plants will weigh from five to fifteen pounds. An exceptionally large plant found near Lone Pine, California, weighed 60 pounds exclusive of the twigs, and shrubs weighing 20 to 40 pounds are not rare. This is partly because the plants reach the maximum size only under favorable conditions and partly because they are frequently burned or cut off near the base, after which new stems shoot up only to be again destroyed before reaching maturity.

Another shrub that is treated at length is the *Haplopappus*, which contains considerable more rubber than the *Chrysothamnus*, from 6 to 10 per cent. The product is, however, soft and resinous.

A brief, even of the briefest, of the many lines of investigation, the chemical analyses and the microscopic examinations, is out of the question here, so comprehensive is the work.

In conclusion it is to be hoped that the work will be carried farther and that the cultural possibilities of these interesting shrubs will be fully investigated and at an early date.

PEACE PROBLEMS AND PROGRESS.

INTERNATIONAL TRADE CONFERENCE.

The International Trade Conference held in October at Atlantic City, New Jersey, and the subsequent tour of the foreign delegates to the principal industrial centers of the United States has accomplished much toward the desired restoration of world commerce, and it is believed that a program may now be framed which will help Europe to regain her feet commercially and industrially.

America now knows the needs of her allies in raw materials, food and machinery, and the action taken at Atlantic City indicates that their needs will be met. America also appreciates more fully that American prosperity is bound up in European prosperity, for Europe cannot pay even the interest on the debt she owes us unless she can be restored to production. The whole matter resolves itself into a business proposition of enormous proportions to be handled in a business way, with credit as the base.

A permanent organization was formed to make effective the purpose of the conference. An international meeting will be held in 1920, after which the gatherings will be biennial. Approval was given to the Edge Bill, recently passed, authorizing financial assistance in Europe, and also to effective investments in foreign credits against which debentures of American companies may be issued.

England asks only for an opportunity to purchase in America certain commodities for which she can pay. Belgium, which

is recovering rapidly from the war, asks for credit to enable her to buy here. France and Italy have the most pressing needs, and their request is for long time loans.

GOODRICH TRAVEL AND TRANSPORT BUREAU.

Prompted by a growing demand for highway information and charts from highway transportation engineers and advocates, the National Touring Bureau of The B. F. Goodrich Rubber Co. announces that its scope of operation will be broadened to include the dissemination and distribution of all highway transport data.

Henceforth it will be known as the Goodrich Travel and Transport Bureau. Through its country-wide organization of branches, depots and dealers the bureau has distributed upwards of 150,000,000 pieces of touring information to the motoring public. During 1919 it distributed nearly 5,000,000 state highway maps.

Raymond Beck, who acted as field engineer of the United States Highways Transport Committee during the war, has been chief of the bureau since its inception in 1911.

A campaign has been inaugurated by the bureau to make American highways 100 per cent efficient by keeping them open this winter.

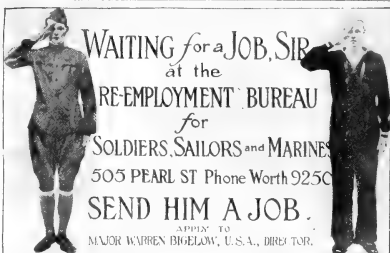

A booklet has been prepared on the subject that will be distributed to state and county highway engineers and commissioners. It shows that the snow problem can be solved in two ways or by a combination of both, consisting of drift prevention measures and snow removal methods.

TIRE BUSINESS TO EXCEED A BILLION DOLLARS IN 1920.

G. W. Yeoman, treasurer of the Continental Motors Corp., Detroit, Michigan, and a director of the Motor and Accessory Manufacturers' Association believes it is likely that the production of passenger automobiles for 1920 will be near the 2,000,000 mark, while the output of commercial motor vehicles will be about 300,000. He also asserts that there will be nearly 8,000,000 power driven vehicles, including both passenger and commercial cars, in actual use by the dawn of the new year.

This estimate approximately coincides with the deductions of others in a position to know, and from it the probable tire demand for the year can be readily computed.

With 8,000,000 motor cars in operation, some 40,000,000 tires will be in use and will be required annually. To these must be added 8,000,000 tires required for the original equipment of 2,000,000 new cars and 2,000,000 more which will be needed for spares within the year. The 300,000 new trucks will require 1,200,000 tires for original equipment and 300,000 more for spares. All told it appears that the 1920 tire demand may reach 51,500,000 tires valued at some \$1,287,500,000.

Making Arctics by Machinery.

AFTER SEVERAL YEARS of experimenting a process of making cloth arctics by machinery after the manner of manufacturing leather shoes, has been perfected. The advantages of the machine over the hand method are a lower production cost per pair, sturdier and more nearly standard shoes, less waste and greater output, all of which have been so satisfactorily demonstrated that rubber shoe factories are beginning to change over to the machine method.

In order that the difference between hand and machine manufacture may be clearly brought out, the time-honored hand system is briefly described.

THE HAND METHOD.

A prevailing type of one-buckle arctic consists of twenty parts: the insole, rag sole, filler, outsole, heel lift, lining (usually of wool or fleece) joining strip or piping, toe cap, rag heel, cloth heel, foxing, gum inner vamp, friction inner vamp, quarter and vamp facing, heel strip, back stay, quarter stay, cord buckle strap and buckles. A team of three men is the usual complement for making this shoe although individual makers frequently construct the arctic from start to finish.

All of the inside pieces, such as the insole, rag sole, etc., are coated with cement, the wood linings are joined at the seams with $\frac{1}{4}$ -inch piping, the quarter is edged with cord and the buckles put on by girls in the make-ready department or stock cage for the team workers; individual makers prepare their own work.

At the start of the operation the first maker "lasts over" the lining to the insole, applies the heel lift, friction toe foxing, rag filler and gum inner vamp. The shoe then passes to maker number two, who completes the construction of the upper by

instead of being built on the last, piece by piece, is made up complete before lasting, the same as the upper of a leather or tennis shoe. Thus the top is completely fitted to the last.

The construction of the upper is similar except that the linings follow the same lines as the facings and are made to fit exactly, thus avoiding the waste of trimming after vulcanization. The gum foxings are placed on the upper before lasting as follows: the heel foxing is placed on the quarter and rolled by machine; the quarter is then stitched to the vamp on a Singer sewing machine, after which the toe foxing is applied so

ASSEMBLING AND LASTING.

Right to left: The man is tacking the insole to the last. Next is the machine which assembles the upper and insole at the heel. Directly in front are two consolidated hand lasting machines or "niggerheads" which nail the upper to the insole. In the rear is a "pulling over" machine, which lasts over the forepart of the upper. Shoes in the foreground are lasted and ready for the "pounder."

that it overlaps the heel foxing at the sides. The edges of the top are cemented by machine in one operation, and it is ready for lasting.

An insole of fiber board or composition material is generally used, although the ordinary sole of "rag" and cloth answers the purpose, provided the rag is compounded with plenty of fibrous material to make it stiff. A rag filler smaller than the insole is cemented to it by an insole cementing machine and molded to the shape of the last on a molding machine similar to that used to mold outsoles of leather shoes.

Wooden lasts bottomed with a sheet of metal perforated with holes at the ball, shank and heel are used, but any style of wooden or metal last can be adapted to the method. A tacking machine fastens the insole to the last by inserting a tack in each of the three holes for temporary purposes. The insole and the upper are then assembled on an assembling machine, which tacks the upper to the last at a point just above the heel foxing and lasts over the heel. Thus the upper is held firmly in place on the last, and the large lining of the hand-made arctic becomes unnecessary. The small tack hole just above the foxing in no way impairs the waterproof qualities of the shoe, as it closes during vulcanization.

The shoe then passes to the "pulling over" machine, which pulls or lasts over the upper at the forepart after which the hand-method lasting machine or "niggerhead" fastens the upper securely to the insole by inserting a line of tacks about $\frac{1}{4}$ -inch from the edge. The upper has previously been cemented along the edge, so the machine arctic is both nailed and cemented. The thickness of the upper corresponds to the gage of the filler, consequently the bottom of the shoe is smooth. Even the most experienced hand lasters cannot always avoid the bunches and

PREPARING THE UPPER AND MOLDING THE OUTSOLE.

Right to left: The girl is rolling the foxing on the assembled upper. Machines on the bench are Singer sewing machine, cementing machine for the edges of the upper, "stitcher" for the foxing, and a second cementing machine. On the right are assembled tops ready for lasting. Machine at the left is for molding the insole to the shape of the last.

putting on the rag heel, cloth heel, and the facings, which are applied separately, it will be noted, and joined at the sides.

Maker number three finishes the shoe by "stitching" (a term used for running a serrated roller around the edges of the foxing and outsole to bind them together) the foxing, putting on the gum toe cap, and rolling on the outsole. After the shoes are vulcanized, they are stripped from the lasts in the packing room and the surplus lining trimmed off.

THE MACHINE METHOD.

The first difference in the machine method which has been developed by the United Shoe Machinery Co. is that the upper

jumps at the toe and heel. A machine known as a "pounder" finishes off the bottom, buffing away the rough edges and removing the three racks which hold the insole to the last. A different type of cementing machine cements the bottom, and the shoes are dried on racks before the outsole is applied.

The outsole is put on by a recently invented sole-laying machine. By working a foot lever a cushion consisting of layers of vulcanized rubber presses the sole on the shoe after the manner of a vise. The cushion of rubber applies uniform, direct pressure to the entire surface of the sole and envelopes it so that it can be used for rolled and semi-rolled edge outsoles. A machine "stitcher" finishes off the job, and the shoe is ready to be vulcanized.

Manufacturers have found that the yield of "seconds" from machine-made arctics is much lower than from the hand-made product. Uniform pressure of machine rolling on the foxings and outsole is responsible for this, as blistering owing to light

LAYING THE OUTSOLE.

The man is applying the outsole on a sole laying machine. At the right is the machine for cementing the insole. Shoes on the rack are ready to be out-soled.

rolling has been eliminated. The two, four and six-buckle arctics involve no new problems of manufacture, the only difference being in the construction of the upper. The same lasts are used with an ankle piece fastened on.

This is the first process in the history of the rubber shoe business by which arctics have been made by machinery. It will be interesting to watch further developments in this field, for the introduction of machinery will undoubtedly make for standardization and increased production in rubber shoes of all varieties.

NUMBER OF EMPLOYEES, TOTAL PRODUCTION AND CRUDE RUBBER CONSUMED IN THE RUBBER INDUSTRY 1917-1918.

The request of The Rubber Association of America for information was answered this year by only 103 out of 452 manufacturers, but these represented 73 per cent of the rubber output in 1917; the same percentage is therefore employed in estimating the totals for 1918. The number of employees reported by the minority was 151,078 in 1917 and 148,787 in 1918 a diminution of 3,896 or 1.88 per cent. Applying this percentage to the total number reported in 1917 gives 203,818 as the total number of employees in 1918.

The 103 manufacturers sold \$819,159,105 worth of goods as compared with \$654,948,376 in 1917, an increase of 26.4 per cent. Applying the same method to the computation of the total sales we obtain \$1,122,135,760 as the estimate for 1918 compared with the \$895,816,248 reported for 1917. It may be noted that the product of the 103 in 1918 is very nearly equal to the total product of 1917.

The total amount of crude rubber used in 1918, 322,606,605 pounds, was only a little over 5 per cent more than the 306,113,652 pounds consumed in 1917. About an eighth less rubber was used for casings under 6 inches, 140,021,023 pounds instead of 162,643,482 pounds in 1917, while the quantity put into solid tires doubled, 50,024,166 pounds instead of 25,055,673 pounds in 1917, while that employed for other tires and tire sundries increased by two-fifths, 14,221,023 pounds as compared with 9,983,195.

While the total amount of rubber used for tires increased slightly, 237,168,347 pounds in 1918 and 233,386,796 pounds in 1917, the quantity used for other rubber goods was greater relatively, so that the proportion of rubber for tires was a shade under three-fourths of the total in 1918 instead of a little above as in 1917. The increase in boots and shoes was about a sixth, 31,468,843 pounds; that in mechanical goods very slight, 22,101,528 pounds and that in other products almost a third, 31,897,887 pounds.

BRITISH COTTON TRADE DEALS.

With regard to the recent cotton trade deals, it is of interest to note the connection of some of the moving spirits with the rubber industry. It is well known that the Dunlop Rubber Co., Limited, has its own spinning and weaving mills in Lancashire, so it is not altogether surprising that it is closely concerned with the Amalgamated Cotton Trust which was formed in October, 1918, to acquire certain mills. The first report of this company, issued in November, showed a profit of £14,416. This trust owns twenty mills and is linked up through one or another of its directors with the Dunlop Rubber Co., Limited, the Tyre Investment Trust and the Austin Motor Co.

A. L. Ormrod, who is on the board's financial advisory committee, is chairman of the Dunlop Rubber Co., Limited, and W. T. Glover & Co., Limited, and a director of the Tyre Investment Trust, while Wilfrid Dawson, also on the committee, is a director of the Dunlop company and of the Tyre Investment Trust. Harvey du Cros, a director of the Amalgamated Cotton Trust, is director of the Austin Motor Co., while another director, S. W. Copley, is the owner of a small rubber works among his various other and more important interests. That South African mining and finance are in the cotton mill transfer is seen by the names of A. R. Stephenson, manager of Barnato Brothers, and S. B. Joel.

It is obvious that the sellers of the concern recognize that increased capital is necessary in order to finance the business at the present high price of materials and that building extension will cost far more in the future than in the past.

REACTIONS OF ACCELERATORS DURING VULCANIZATION.¹

By C. W. Bedford and Winfield Scott.

THE HIGHLY POWERED ORGANIC ACCELERATORS known to-day are the carbon bisulphide reaction products of strong organic bases. Perhaps the best example is the piperidine salt of piperidyl-dithiocarbamic acid.

Due to the strong basic nature of piperidine, this salt is stable and may be isolated as such. Strong aliphatic bases such as dimethylamine also give stable dithiocarbamates which are very powerful accelerators.

Thiocarbamide, which is perhaps the most widely used commercial accelerator, is formed by the same mechanism of reaction, there first being formed the aniline salt of phenyl-dithiocarbamic acid.

This aniline salt is extremely unstable due to the weak basic properties of aniline and cannot be isolated as such. The ammonium salt of this phenyl-dithiocarbamic acid may be isolated

¹Published by courtesy of the American Chemical Society. Paper read before the Rubber Division of the American Chemical Society, Philadelphia, Pennsylvania, September 2 to 6, 1919.

but decomposes on standing. The metallic salts of dithiocarbamic acids are much more stable according to Krulla.*

The aniline salt, by loss of hydrogen sulphide, produces thiocarbamilide.

The stable dithiocarbamates above mentioned lose hydrogen sulphide in a similar manner when heated to the temperatures used in the vulcanization of rubber and produce thiourea derivatives. It is, therefore, quite possible that they may function as curing agents in the same manner as thiocarbamilide.

André Dubosc[†] has stated that thiourea derivatives can "furnish in a colloidal state all the sulphur necessary for vulcanization." In checking up this statement it appeared at first that Dubosc was correct, but the cures obtained were soon shown to be due to free sulphur present as an impurity in the accelerator used. Pure thiocarbamilide and pure dithiocarbamates do not vulcanize rubber in the absence of free sulphur either in a pure gum or high zinc oxide stock. We, therefore, are unable to agree with this investigator that the sulphur of such compounds is available for vulcanization.

There are some dithiocarbamates which liberates the free base by a heat decomposition, such, for example, as the liberation of dimethylamine by heating its carbon disulphide reaction product. Since these free bases are evidently good curing agents, it is possible that they may function as accelerators after being liberated by a heat decomposition of the dithiocarbamates. It is, however, not the object of this paper to discuss the mechanism of the action of thiourea derivatives as accelerators. What we wish to show is that there are many accelerators not ordinarily, classed with thiocarbamilide but which undoubtedly produce thiourea derivatives by reason with sulphur during the vulcanization process, so that they may be classed as being similar to thiocarbamilide in their ultimate action.

In June, 1913, J. Bastide was granted a patent[‡] wherein he claimed methylene and ethylene compounds of aliphatic and aromatic amines as vulcanization accelerators. As specific examples he mentions methylene-diphenyl-diamine and phenyl-imino-methane, the latter being otherwise known as anhydro-formaldehyde-aniline or methylene-aniline. These two accelerators easily react with sulphur to form thiourea derivatives.

Methylene-aniline easily polymerizes to the di-, tri-, and probably higher polymers. We have found it convenient to consider it as the dipolymer and to take 210 as the molecular weight. It has been found that 210 grams of methylene-aniline will react with four atomic weights of sulphur, whereby one molecular weight of carbon bisulphide and one molecular weight of hydrogen sulphide are lost and that about 95 per cent of the product is thiocarbamilide.

This reaction starts at about 130 degrees C. and proceeds best at 150 degrees C. The amount of carbon bisulphide liberated may be determined by condensing as much as possible and weighing. Any uncondensed carbon bisulphide vapors may be caught in aniline wash bottles which have previously been saturated with hydrogen sulphide. The amount of hydrogen sulphide may be determined by absorption in caustic. A small amount of aniline and other products are formed by side reactions.

It is quite probable from the above data that methylene-aniline, when compounded as such, will generate carbon bisulphide during the cure. In the presence of basic amido compounds this carbon bisulphide should at once generate dithiocarbamates, similar to those which have been shown by Ostromislensky to have such high curing power. The curing power of methylene-aniline may, therefore, be due in part to the formation of dithiocarbamates formed from carbon bisulphide liberated slowly in the cure and a subsequent reaction with amido compounds which may be present, but its chief curing power is evidently due to the direct formation of thiocarbamilide. It must not be assumed, however,

that methylene-aniline should therefore have as strong a curing power as thiocarbamilide. That this is not the case is undoubtedly due to the lag of the sulphur reaction during the cure.

Methylene-diphenyl-diamine produces several reaction products when heated with sulphur, the reaction proceeding easily at 140 degrees—150 degrees C.

(a) A certain amount of the thiocarbamilide is formed, but the yield is comparatively low.

(b) Methylene-diphenyl-diamine by heat alone loses aniline, probably by a semidine reaction with itself.

This reaction may be continued until the condensation has proceeded so far that one mole of the original compound has lost one mole of aniline. By reaction with sulphur before compounding and removal of such free aniline as may be formed, there is produced an accelerator of much greater curing power than the original material and which shows curing properties very similar to those of thiocarbamilide. One of the constituents of this reaction is apparently a sulphur reaction product. Another very closely resembles thiocarbamilide and is probably one of the reaction products which is formed from methylene-diphenyl-diamine when this compound is used as an accelerator for the vulcanization of rubber.

(c) Methylene-diphenyl-diamine in the presence of aniline, either added as such or formed by reaction (b), undergoes a semidine transformation with the aniline at temperatures even lower than milling temperatures. Paramido-benzyl-aniline is a liquid which is crystallizable with difficulty and forms so easily from the other reaction product that there is no difference in the curing power of the two compounds. Paramido-benzyl-aniline reacts easily with sulphur to produce para-amido-thiobenzaniline.

The latter is another compound very similar to thiocarbamilide, to which may be attributed a portion of the curing power of the original accelerator.

The main reaction of this type of methylene accelerators is evidently to substitute thiocarbonyl groups for methylene groups. This produces compounds very similar to thiocarbamilide and which may be considered as being derived from thiocarbamilide by similar condensation and semidine reactions, although we have been unable to prepare them directly from thiocarbamilide.

In the interaction of hexamethylene-tetramine with sulphur during the cure, we have another possibility of the formation of carbon bisulphide reaction products with amines. Hexamethylene-tetramine reacts very readily with sulphur at curing temperatures, producing a multitude of products including hydrogen sulphide, ammonia and carbon bisulphide in large amounts. Dubosc[§] has described the sulphur reaction products of hexamethylene-tetramine, but for some unaccountable reason has absolutely overlooked two of the main reaction products, ammonia and carbon bisulphide. The accelerating action of hexamethylene-tetramine may therefore be explained by the interaction of this ammonia and carbon bisulphide to form a dithiocarbamate. This allows us to classify hexamethylene-tetramine as a thiourea accelerator.

With a large majority of accelerators there is no possibility of the formation of thiourea derivatives by a reaction with sulphur. As far as is known, all accelerators containing methylene groups, similar to those described, react easily with sulphur at curing temperatures to produce thiourea derivatives. This does not include, however, the methylene groups of such compounds as piperidine, or penta-methylene-diamine which on heating loses ammonia and forms piperidine.

SUMMARY.

1.—Organic accelerators containing methylene groups, similar to those described, readily react with sulphur to produce thiourea derivatives.

2.—These sulphur reactions take place at curing temperatures and may throw some light on the mechanism of the reactions of these accelerators during vulcanization.

Volume Increase of Compounded Rubber Under Strain.¹

By H. F. Schippel.

THE FIRST RECORD of this interesting phenomenon of volume increase in rubber under strain dates back as far as 1884, when Joule recorded the fact that the specific gravity of rubber decreased upon stretching it. His test results stated a change of specific gravity of 0.15 per cent for a 100 per cent stretch. This is a very small increase, and therefore his experiments were made upon comparatively pure rubber, unmixed with pigments, as the present paper will show.

In 1889, Mallock made tests upon pigmented rubbers of different kinds, but he made the volume elasticity tests upon the samples only by applying pressure to the water in which he immersed them, thereby simply corroborating the results of the previous investigator.

Again, in 1890, Sir William Thomson stated that a column of rubber when stretched out suffers no sensible change in volume, and that the contraction of any transverse diameter must be sensibly equal to one-half of the longitudinal extension, and rubber may therefore be regarded as an incompressible elastic solid. This also is true of pure rubber.

While studying the nature of the stress-strain curves for rubber containing different pigments in varying quantities, the writer considered the stability of the rubber surrounding each particle of pigment in the rubber body, and thought that possibly when the rubber body was elongated sufficiently, the rubber might pull away from the particles of pigment in their axes of stress, and cause vacua to be formed on both sides of each particle, the net result of which should be a considerable increase in the volume of the rubber body as a whole.

A preliminary test was made by preparing a transparent vulcanized compound containing a fair proportion of medium-sized lead shot. When this compound was stretched,

5 grams of sulphur, and 337 grams of whiting, and press cured for 30 minutes at 40 pounds' steam pressure, gave a volume increase of 52 per cent at an elongation of 140 per cent, while the estimated volume increase for a similar compound containing 215 grams of barytes in place of the whiting was 120 per cent at the breaking point. In the former case, the average value of Poisson's ratio up to the breaking point was 0.39 and in the latter case 0.31. These values are not at all abnormal, but their cumulative effect in a substance which has the ability to withstand comparatively enormous elastic strains is worthy of serious consideration from a physical standpoint.

For smaller percentages by volume of barytes, the volume increase was found to be less at the breaking point, and similarly for larger volume percentages, due in the latter case to the formation of local contractions similar to that of metals.

It was also noted that when barytes was substituted by an equal volume of lampblack, the volume increases for any given elongation were smaller.

Systematic tests were accordingly made upon a series of compounds containing in various volume percentages one of the following pigments in each case: barytes, whiting, zinc oxide, china clay, red oxide, lampblack, and carbon black. The curves shown give graphically the results obtained.

The common base was made up of 100 parts by weight of fine Pará, 5 parts sulphur and 30 parts litharge, the weight of the test pigment added in any case being the volume index for that case multiplied by the specific gravity of the pigment.

A blank test was made by stretching the base only without

Fig. 1.

Fig. 2.

Fig. 3.

the formation of vacua proceeded gradually until each lead shot had its conical vacua on both sides in the direction of strain. This was very satisfactory, and the test was immediately applied to miscellaneous samples of rubber compounds, with the result that this integral phenomenon was actually found to take place. It was more noticeable in the red rubber than in the white. Also, after keeping the samples under tension for some time, and then releasing, temporary increase of volume was noted, which was due to sub-permanent set, or the diffusion of gases into the vacua, or both. In certain cases, the observed volume increases under simple strain were very remarkable. For example, a specimen made up of 100 grams of fine Pará, 30 grams of litharge,

any other pigment content. The curve obtained is marked "O" on each series of curves for the pigments.

METHOD OF PROCEDURE.

Test rings, having a cross-sectional diameter of $\frac{1}{2}$ inch, and an outside diameter of $2\frac{1}{4}$ inches, were made from each compound up to about 35 volumes content. For volumes above this, the compounds were too stiff to make a perfect fit in the ring mold, and flat slabs about 100 mils. thick were made, from which flat rings were cut. The internal circumference of the rings was approximately four inches. Each ring was stretched consecutively over each of a graduated series of steel bars from three to eight inches long, or as far as the ultimate stretch of the rubber would allow, and the volume increase was calculated by

¹Published by courtesy of the American Chemical Society. Paper read before the Rubber Division of the American Chemical Society, at Philadelphia, Pennsylvania, September 4, 1919.

determining the change of specific gravity. This method, which avoided the construction of any special apparatus, and was very accurate, was the suggestion of Mr. W. B. Wiegand, whose inspiring cooperation in this and other rubber researches the writer takes pleasure in acknowledging.

(1) BARYTES: The test results are shown by that part of each curve in full line. It was found impossible to obtain higher elongations than 200 per cent for the large rings, owing to their failure by slow tearing when stretched above this value. The curves approximate closely to straight lines, showing that the volume increase varies almost directly with the elongation. Also for a constant elongation, the volume increases progresses with the percentage of barytes in a roughly proportionate manner. There appears to be no adhesion whatever (or very little) between the rubber and the particles of barytes, because there is a volume increase in the compound containing only five volumes of barytes. The particles are certainly not crowded in a five per cent mix, and their surfaces do not necessarily transmit the whole local stress, but on account of this early separation of the pigment particles from the rubber, the particles take no important part in the stress-strain curve for the body, since the stress is transmitted through the rubber only.

It was thought that possibly the large volume increases might be due to the pigment entering the rubber in agglomerated masses, and that most of the increase in volume might be due to the ready separation from one another of particles which were in dry contact. Accordingly, two tests were made to determine this, one test of a sample of compound milled for 60 minutes instead of 21 minutes for the normal mix, and another test upon a sample which was softened to cement consistency in gasoline, thoroughly mixed, dried, and press-cured as usual. The excessively milled sample showed a very slight increase of percentage volume increase, but the decrease of this property in the cement sample was more considerable. The entry of the gasoline into the compound presumably softened the rubber and allowed it to flow around each particle, wetting the whole mass of pigment thoroughly; so that, although part of the volume increase under stretch is due to the separation of pigment surfaces in dry contact, the larger part of the increase is due to rubber separation from the surface of the particles.

The curves were extended as shown by the dotted lines to the point corresponding to the ultimate percentage elongation as obtained from standard breaking tests on a tensile testing

machine. higher elongations could be obtained on the tensile testing machine.

(2) WHITING. The curves for this series of compounds show that up to 40 volumes of whiting, the percentage increase is comparatively small, then there is a sudden jump in volume increase with further addition of pigments, until at 150 volumes the whiting gives results almost equal to those with barytes. This probably is due to agglomeration of the pigment particles when present in large amounts. It should be noted that these curves are plotted on a more open scale of per cent volume increase than that of the barytes.

(3) ZINC OXIDE.—The trend of the zinc oxide curves up to 30 volumes is identical with that of the basic mix, although the ultimate elongation is reduced as much as 250 per cent. This shows that there is a strong adhesion of the rubber to the particles of zinc oxide, which imparts additional strength to the basic mix, but which reduces the ultimate elongation on account of the dilution of the rubber. This phenomenon classifies zinc oxide physically with the finer pigments, lampblack and carbon black. The upward shift of the curves for volumes above 30 indicate a rapid growth of agglomerated masses of particles which greatly reduce the tensile strength of these compounds.

The shape of the almost complete 125-volume curve indicates that the large extrapolations of the other curves are approximately correct.

(4) CHINA CLAY.—The range of volumes experimented upon is not so large, but there is indicated an increase in volume for the low percentages of pigment. The open scale of "volume increase" to which these curves are plotted should be noted. The trend of these low volume curves away from the basic mix curves shows that the addition of china clay to rubber lowers the tensile effect upon the compound.

(5) RED OXIDE.—The red oxide, being a finer pigment than china clay, shows less volume increase under strain. Also, departure from the curve of the basic mix shows a weakening effect upon the compound.

(6) LAMPBLACK.—The volume increase of the lampblack compounds is graduated proportionally to the content of lampblack up to 50 volumes. The 75-volume compound shows a considerable rise of volume increase, which indicates a rapidly increasing agglomeration of the particles. This means that the limit of ability of the rubber to wet each particle of lampblack has been reached at 50 volumes, and above this volume the rubber surrounds groups of particles instead of embedding individually.

FIG. 5.

FIG. 6.

FIG. 7.

machine. The full-line curve joining these points is of special interest. The discontinuity above 50 volumes is due to the formation of local contractions in the test ring, so that the whole body of rubber does not receive the same proportional elongation. The neck is similar to that formed on metal specimens. By mechanically working the rubber rings until the stiffness is removed, greater volume increases are obtained, i. e., we obtain points on the true extension of these curves. In the same way

(7) CARBON BLACK.—A 30-volume content of carbon black lowers the ultimate elongation of the rubber to 530 per cent, while the same volume of lampblack lowers it to 420 per cent. This indicates a greater weakening effect of the lampblack on the rubber, although the volume increase under equal strain is less.

CURVES FOR 50 PER CENT AND 100 PER CENT STRENGTH.—Figs. 8 and 9 show the property of volume increase in a different light. Here the variation of percentage volume increases is shown on

a "volume of pigment" base for constant elongations of 50 per cent and 100 per cent. These curves are really a more distinct representation of the growth of agglomerated masses of pigment as the volume of pigment is increased. It will be noticed that at

100 per cent strength the whitening and zinc oxide curves tend to approach the barytes curve, due to the more rapid formation of agglomerated masses of these pigments than that of the barytes. Since the average particle of whitening has only one-eighth the volume of the average particle of barytes, it would require an agglomeration of the whole body of whitening into average groups of eight particles each to cause the whitening curve to meet the barytes curve, or multiples of eight, if there already existed an agglomeration of the barytes particles. This agglomeration of the pigment particles and the phenomena connected with it are of vital importance, since the sudden growth of agglomerated particles at certain volumes may be coincident with a rapid increase of hysteresis, due to the friction when the rubber body is distorted, amongst those particles which are in dry contact with each other. Conversely, any means of reducing the agglomeration

Fig. 8.

greater is the volume increase under strain. A confirmation of this statement was the result of a test on four samples of barytes compounds, containing equal volumes of barytes of different degrees of fineness. The different grades were prepared by allutration in water. The compound containing the finest grade of barytes showed the least volume increase under strain. This was a critical test which eliminated every other variable but the size of the pigment.

Fig. 9.

sis, such as the method of milling, and the use of solvents to reduce the viscosity of the rubber while mixing in the pigment.

Fig. 10 shows the percentage volume increase at failure on a base of percentage pigment, plotted up to the point of maximum volume increase, which takes place, as mentioned before, when local contraction of area occurs. These maximum points, as

Fig. 10.

shown for the three pigments barytes, whitening, and zinc oxide, lie approximately on a circle having the origin as center. The lamp-black curve cannot be extended sufficiently far to reach the maximum volume increase due to the inability of the rubber to absorb large quantities of lampblack. The curves for china clay, red oxide, and carbon black are not shown, but as far as they have been obtained, the fall between whitening and zinc oxide, the china clay lying highest and the carbon black lowest of the three.

Fig. 11 undoubtedly shows the real explanation of the variability of the pigments from the volume increase standpoint. They show that, with the exception of zinc oxide, the greater the mean diameter of the pigment particles, the

A NEW FIELD FOR RUBBER CULTURE.

Papua or British New Guinea is entering the plantation rubber field in earnest. One company has nearly 2000 acres with 152,000 trees, over

Fig. 11.

50,000 of which are tappable; it produced 89,938 pounds of rubber in 1918 as compared with 54,303 pounds in 1917. Another company has 920 acres planted with *Hevea*. With the rise in the price of rubber, or if Australia will establish preferential trade conditions, the Papuan rubber may compete in Australia with that from Singapore.

NEW ZEALAND TIRE IMPORTS.

The value of New Zealand's tire imports for 1916 was £639,719, for 1917 £453,893, for 1918 £702,026, and for the first four months of 1919 £334,472.

The following tabulation shows the total value of motor car tires imported at each port in New Zealand and the country of shipments and origin during the month of May, 1919:

From	Origin of Shipment	Auckland	Wellington	Lyttelton	Dunedin	Other Ports	Totals
United Kingdom.....	U. K.	£35	£1,874	£6,489	£23	£1,254	£9,675

U. S. Army Methods of Procuring and Salvaging Rubber Articles

By John J. Cameron.

THE TREMENDOUS DEMANDS of the Army during the war for articles of rubber, numbering thousands of separate items, were met, because the Army took practically the entire capacity of all the mills in the United States, because at all times the manufacturers of rubber goods gave the Government their best services and did all in their power to meet the heavy demands made upon them, and because of the great savings made in salvaging articles containing rubber.

ARTICLES PURCHASED BY CLOTHING AND EQUIPAGE DIVISION.

The chief purchases of rubber goods made during the war by the Clothing and Equipage Division, Office of the Quartermaster General, Director of Purchase and Storage, which is charged with furnishing all the clothing for the Army, were:

Article.	Purchases.		Deliveries.	
	Apr. 1, 1917- Nov. 11, 1918.		Apr. 1, 1917- Dec. 17, 1919.	
Rubber boots, hvy.	3,644,280	pairs	2,885,082	
Rubber boots, lt.	562,163	pairs	531,663	
Overalls, artic.	3,222,160	pairs	3,222,160	
Raincoats, foot (including slickers and ponchos) ..	8,783,074		8,255,950	
Raincoats, mounted	106,000		96,996	
Oilskin coats	1,655,532		734,068	
Oilskin hats	1,703,170		954,252	
Oilskin trousers	1,646,822		728,448	

The difference in purchases and deliveries are accounted for by contracts cancelled or in the process of cancellation.

The reasons for these enormous purchases are largely accounted for by the fact that the consumption in action is three or four times that of the peace rate. The rule generally followed in supplying clothing was that there should be for each

Supplying our soldiers with raincoats was a difficult problem. As there was not a sufficient capacity in this country to meet the requirements, practically all stocks of commercial raincoats were purchased on the assumption that even a poor cover was better than none. In October, 1918, for instance, when the influenza epidemic was prevalent in the West, it was found that there was a great shortage of raincoats made in accordance with government specifications. As there was no one place in the zone where commercial raincoats could be bought in large quantities, it was necessary to go into the open market and purchase these coats from jobbers, and retailers, large and small. Authorization was secured from Washington, and the San Francisco Depot at this time purchased approximately 69,175 raincoats, valued \$280,462.

The total purchases of ponchos, raincoats and slickers during the war amounted to over 10,000,000 garments, costing \$46,000,000.

The lack of tonnage led to the adoption of baling garments for shipment overseas as compared with the old method of boxing them. By baling there is saved from 50 to 70 per cent of the space required for cased goods. Nine and nine-tenths blankets cased require as much space as 25 blankets baled, and fifteen and one-half slickers cased require as much space as 45 slickers baled.

Statistics recently prepared showed that this method of packing equipage, which includes all forms of clothing, such as uniforms, boots, etc., saved the Government during the war over \$50,000,000 in labor, time of handling, and ship tonnage space.

ARTICLES PURCHASED BY MOTORS AND VEHICLES DIVISION.

Next in importance to the purchases of rubber made by the Clothing and Equipage Division were those made by the present Motors and Vehicles Division of the Office of the Quartermaster General, Director of Purchase and Storage. Exhaustive tire tests were made from time to time and orders placed with manufacturers who met the specifications. Tube and solid tire replacements for overseas use were heavy because of the condition surrounding operations of the vehicles.

The total amounts of rubber material purchased by the Motors and Vehicles Division of the Office of the Quartermaster General, Director of Purchase and Storage, from April 18, 1918, when the procurement of motor vehicles, tires and spare parts was consolidated in the Quartermaster Corps, and all the motor vehicle procuring organizations of all the corps of the Army from April 6, 1917, to December 16, 1919, were as follows:

Article.	Quantity.	Value.
Tires	335,983	\$13,655,363.72
Tubes	899,092	2,331,439.84
Casings	784,145	15,654,601.56
Class "B" Solids (aerial equipment)	108,127	4,798,552.38
Hose and tubing	576,936	105,851.69
Patches (tire)	121,873	21,096.18
Vulcanizing rubber	739	552.94
Battery parts, hard rubber	17,078	1,999.62
Miscellaneous	2,188	822.13
Grand total		\$36,570,280.66

The allocation of tires and tubes made up to June 30, 1919, amounted to 157,974 units, or 2,704.69 tons.

COOPERATION OF RUBBER MANUFACTURERS.

The second factor enabling the Government to obtain the necessary products made of rubber was the cooperation of the manufacturers who helped solve the problem by giving their services and converting their plants. Crude rubber was supplied to the factories through The Rubber Association of America, Inc. The allocation of raw materials was one of the chief

(Signal Corps, A. E. F., U. S. Army.)

RUBBER REPAIR DEPARTMENT OF THE SALVAGE DEPOT, ST. PIERRE-DES-CORPS, FRANCE. HERE ALL RUBBER GOODS ARE REPAIRED. THE MEN IN THE BACKGROUND ARE REPAIRING AND VULCANIZING RUBBER BOOTS.

man at the front a three months' reserve in France, another two or three months' reserve in the United States, and another three months' supply in transit.

In supplying articles of rubber, which are matters of common commercial production, however, the problem was not as difficult as compared with the making of gas masks, an article not before manufactured. But the large needs of initial equipment did put an enormous strain on the industries turning out rubber goods. Of the different types of rubber boots purchased by the Clothing Equipage Division, there were more than 4,000,000 pairs, costing more than \$20,500,000, one-half of which were purchased by the Clothing and Equipage Division since January, 1918.

functions of this association. The Rubber Association on May 10, 1918, called all rubber manufacturers to a meeting in New York. At this time they were notified that the plan of allocating crude rubber under a limited tonnage arrangement for the months of May, June and July would only give each manufacturer one-fourth of the seven-sixteenths of the amount of crude rubber which each company had received throughout the year 1917. The allocation of crude rubber on July 31 was reduced to three-eighths instead of seven-sixteenths, based on the average 1917 consumption of each factory.

As showing the cooperation that existed between the manufacturers of products and the Government, the manner in which prices were fixed for rubber footwear may be cited. A letter, first of all, was addressed to the various manufacturers specifying prices and asking their concurrence. On further consideration, these prices proving incorrect, it was decided to make a more extended examination of the cost of manufacture before fixing the prices. Accordingly, a meeting of the manufacturers was held in Washington. A committee was then appointed consisting of representatives of the important rubber manufacturers of the country and representatives of the Clothing and Equipage Division, with the understanding that the committee would meet in New York and consider in detail the cost sheets of the various manufacturers. The price fixed in accordance with recommendation of this committee was \$5.25 a pair for hip pressure boots, with variations in price for other boots and for additional features.

SALVAGE SERVICE OF THE QUARTERMASTER CORPS ABROAD.

The third reason that the Government was able to have its demands for rubber articles supplied was due to the Salvage Service of the Quartermaster Corps, both here and abroad. Early the attention of the Army was called to the fact that rubber was not only expensive and limited in quantity, but that owing to the peculiar properties of rubber the greatest amount of care had to be taken in salvaging rubber properly.

The rubber salvaged in the A. E. F. for the year 1918 totaled 1,591,565 pounds.

The general plan of salvaging a front line sector which met with the best results consisted in outlining the main boundaries, then dividing the immediate districts into definite sectors and assigning a suitable personnel with an adequate amount of transportation to clean up the area. The salvage that was collected from this area was collected in huge piles known as advance dumps. These dumps were for convenience placed on lines of auto truck, and, if possible, rail travel. Serviceable material was held for reissue, while the other property, after being sorted, was sent to the interior depots. During an offensive operation the primary object of salvage was to collect those particular articles of salvage which were in constant demand at such a time and to return such serviceable articles with the least possible delay to the troops. Serviceable material suitable for immediate reissue was turned over to quartermaster or ordnance personnel at the collection dumps, if there was need of this material. If not, it followed the same course as any other salvage and went on to the rear. At all times, preference in salvage operations was given to perishable material, such as clothing and articles made of rubber, while articles that would not suffer from exposure were left for salvaging after the perishable things had been gathered.

Pioneer infantry and labor battalions assisted in the collection of salvage in the St. Mihiel offensive. Following heavy offensive large numbers of line troops were also employed in the collection work. It was estimated that at least 400 men for each division in the line should start salvaging when the line had stabilized after an offensive. So rapid and well organized was the work of salvage to avoid deterioration of equipment, that out of \$3,100,000 worth of salvaged materials, 87 per cent of the ordnance and 47 per cent of the quartermaster property

recovered was available for immediate reissue, thus largely reducing the amount shipped to the shops and depots for renovation and repair.

THE VALUE OF POSTER ADVERTISING.

The idea of salvage was a novelty and it would not be expected at first that men would save instinctively. Education along this line was needed and a definite form of propaganda was put forward to educate the men into the idea of cutting down waste.

(Signal Corps, A. E. F., U. S. Army.)

RECLAIMING SLICKERS AND SHELTER HALVES AT THE SALVAGE DEPOT, ST. PIERRE-DES-CORPS, FRANCE.

Posters and placards were printed and posted in conspicuous places calling attention to the proximity of a salvage dump or urging them to take better care of government property. One poster read: "Yank Motto—DO NOT LET Government Property Lie Around. It Spoils—TURN IT IN TO SALVAGE." Another in heavy black-faced type said: "Americans, Did You Do Anything to Help the Salvage Service To-day? Pick it up, Send it to Salvage." Still another warned the men to, "SHOOT STRAIGHT—Serve Your Country Honestly—Start To-day to Salvage." For designing salvage dumps, posters read: "SALVAGE—American Salvage Dump is Located at..... Save It—Send It to Salvage."

So effectively was this advertising campaign carried on that it was nothing unusual to see men returning from the lines with odds and ends of material that they had picked up on the field. In some cases the articles were in good repair and immediately serviceable. Others could be repaired and reissued. In still other cases it was a remnant of old harness or a piece of tattered clothing, articles perhaps of little intrinsic value in themselves, but the total numbers mounted into millions. The piece of leather, for example, which might have appeared to be an utterly worthless scrap, when collected with other scrap leather could be sold to mills and foundries for use in manufacture of carbon and case hardened steels.

Waste sales alone in 1918 totaled \$39,680, while in the month of April, 1919, the sum had reached \$248,675.55.

DEPOTS FOR SALVAGED MATERIALS.

Plants where unserviceable material was repaired were known in general as "Depots" or "Shops." Shops served local troops and were conveniently located at certain base ports and troop centers, while depots were situated at distribution points in the interior. Shops were in operation at Angers, Paris, Bazeilles, Savenay, Gievres, Chaumont, St. Aignan, Brest, Rochefort, Vittel, Le Mans, Tours, Nancy, and Marseilles, as well as in Winchester, England, and Coblenz, Germany. One hundred and eight buildings, with a ground space of 2,574,080 square feet, were occupied in February, 1919, by the Salvage Service, A. E. F. The combined floor space of depots, shops, and laundries was 98,800 square feet, of which 177,425 square feet was built and

owned by the United States, the rest being leased. At shops, repaired articles were in nearly all cases returned to the original wearers.

While the shops handled a large amount of the material and clothing to be repaired, it was obvious that with a military organization the size of the A. E. F. there must be a series of larger depots in the rear to handle the great mass of property collected from the field. To meet this need, the depots at Lyon, Bordeaux, Nantes, St. Nazaire and St. Pierre-des-Corps were established. To these depots, which included seven departments, viz., laundry, clothing, shoes, rubber goods, leather and harness, canvas, webbing and metals, came the grist that had been taken from the battlefield, billet, training area and other sources. Material arrived in all sorts of quantities and conditions. Nothing was too big or too small to be taken care of in these great modern repair plants. While each shop or depot was complete in itself and could handle any sort of repair work it was found often more practicable to designate some special line of work for each of the various places. For instance, the shop at Angers, started July 23, 1918, repaired hundreds of thousands of campaign hats. The general shop at Paris handled large quantities of laundry because of the facilities offered in this line by the French metropolis. To whatever depot the material came, there it was disinfected, laundered and repaired as needed. Then, from the salvage depots the reclaimed material was shipped to general supply depots for reissue.

A DEPOT IS A MODERN INDUSTRIAL PLANT.

In order to give some idea of just what a depot should consist of, the one at St. Pierre-des-Corps may be taken as an example of all the salvage depots in the A. E. F. The buildings taken over at this place had been used by the French for railroad shops and storage purposes. Under American control they presented a vast hive of industry, with workers, most of them women, seated at long rows of tables, sometimes eight hundred in a single room. There were three of these buildings, one with an area of 20,000 square feet, another of 100,000 square feet and a third of 40,000 square feet. Three other buildings, 50 by 180

feet, were later constructed. The buildings were of cement construction, light, well ventilated, and traversed by railroad tracks so arranged as to enable quick loading and unloading of cars.

The laundry was furnished by two 125-h.-p. locomotive type boilers, to facilitate sterilization, washing and drying operations as well as to speed up the drying of slickers and rubber boots in the rubber goods department.

Rubber boots, arctics, slickers, ponchos, and shelter halves were the articles handled by the rubber goods department. About 3,000 garments and 850 pairs of boots were the output of a twenty-four-hour day by this one depot. Slickers were first washed, then examined, the bad garments being used to provide material to repair the good. Patches that were basted on by hand went to the machines where they were stitched and the seams cemented and turned to insure them being waterproof. Boots after being washed were fitted with new taps. These were fastened with cold cement while the heels were first cemented and then nailed. Upper patches made from irreparable boots were cemented and rolled. Vulcanizing machines were installed in the process of factory development and replaced the slower method of patching.

A commissioned officer with five non-commissioned officers and 17 enlisted men composed the American personnel of the St. Pierre-des-Corps Depots, while 28 male and 290 female civilians were employed in this branch. The average wage to the female workers was from 7 to 8 francs a day, while the piece workers received as much as 18 francs a day. Production for the month of August, 1918, was valued at \$231,113.83 for this one depot.

The month of April, 1919, broke all records of the A. E. F. Salvage Service with a total saving made of \$13,877,872.07. Some idea of the scope of these operations can be obtained from a list of articles turned out during the month, the list including:

Article.	Quantity.
Rubber goods articles.....	110,596
Service hats.....	51,628
Articles of clothing.....	2,944,563
Pairs of shoes.....	436,144
Articles of canvas and webbing.....	246,679
Articles of leather and harness.....	29,401
Metal articles.....	200,288

The saving of scrap rubber was a very important function of the Q. M. C. Salvage Service, A. E. F. Some 1,591,565 pounds of rubber were sent back to the United States during 1918. After the signing of the armistice, the disposition of scrap rubber was placed in Europe.

THE RECORD OF SALVAGE DIVISION AT HOME.

The record of the Salvage Division in this country during the war is equally impressive. During the fiscal year ended June 30, 1919, the Salvage Division of the Office of the Quartermaster General, Director of Purchase and Storage, renovated and returned to service the following articles made of rubber goods:

Article.	Fiscal Year, 1919.	Estimated Value.
Arctics.....pairs	27,470	\$116,198
Boots, rubber.....pairs	5,441	18,499
Slickers and raincoats.....	88,386	256,319
Ponchos.....	72,375	130,095

During the same period there was collected in the United States 4,737,975 pounds of rubber waste. Of this quantity, 2,492,417 pounds were sold for a value of \$93,846; a total of 564,500 pounds turned over to Army organizations representing a value of \$42,586. In the period from July 1 to November 1, the Salvage Division sold 691,100 pounds of rubber for a value of \$42,009.84. In the same period there were turned over to Army organizations 14,567 pounds, representing a value of \$1,456.70.

The following formula is employed by the Salvage Division in washing raincoats and slickers: (1) ten minutes in cold suds; (2) cold rinse, five minutes; (3) from the washing machine the coats are taken to dry tumblers where they are run for about 10 minutes. Then these coats are allowed to hang for 12 hours. The cost of washing a slicker by this formula was 35 cents per garment in the United States.

(Signal Corps, A. E. F., U. S. Army.)

SALVAGE DUMP OF THE 26TH DIVISION, NANTEUIL-SUR-MARNE, FRANCE. RAINCOATS, SLICKERS AND PONCHOS READY FOR TRANSPORT BY TRUCK TO THE RAILROAD CARS.

feet, were later constructed. The buildings were of cement construction, light, well ventilated, and traversed by railroad tracks so arranged as to enable quick loading and unloading of cars.

Considerable improvement was effected in the buildings by the United States Engineers and Quartermaster Corps to adapt them for the purpose intended. A large power plant was installed consisting of a 300-h.-p. steam boiler, a 300-h.-p. steam engine and a 225-kilowatt electric generator. Live steam for

War Department Specifications for Mechanical Rubber Goods.

General Specifications for Mechanical Rubber Goods.

War Department Specification No. 333-1-1—June 5, 1919.

THESE SPECIFICATIONS cover mechanical rubber goods used by the War Department. The following are details of such specifications and tests as are common to the articles. For specific information applying directly to particular articles, see detailed specifications which shall take precedence whenever there is any conflict.

CONSTRUCTION.

To be manufactured from the best material designated, free from any and all imperfections and of dimensions as given in the detailed specifications or proposal submitted to manufacturer.

(a) **HOSE**.—Rubber hose shall consist of a rubber tube, cotton reinforcements, and a rubber cover, and shall be of wrapped construction unless otherwise specified in detailed specifications.

Tube and cover of wrapped hose shall be smooth, free from pitting and imperfections, and of uniform thickness. All cotton canvas layers shall be applied on the bias, with edges lapped at least $\frac{1}{2}$ -inch (not sewed), and be well impregnated with a composition to comply with the detailed specifications.

Plies of braided hose shall be evenly braided and imbedded in a properly vulcanized rubber compound best adapted to meet the requirements.

(b) **COUPLINGS**.—Each length of hose shall be properly fitted with couplings and clamps without the use of tape or rubber tissue if, and as required in the original proposal, they shall be supplied by the War Department or as otherwise specified. The female coupling shall be properly fitted with a rubber washer supplied by the hose manufacturer, cut from a rubber tube of the same composition as the hose tube, unless otherwise specified.

(c) **BELTING**.—Rubber and balata belting shall be made of cotton duck, properly impregnated according to standard manufacturing practice, and be of the number of plies and width specified.

(d) **PACKING**.—Rubber packing shall have comparatively smooth surfaces, be free from pitting, and of uniform thickness. All rubber packing to be furnished in rolls weighing approximately 125 pounds.

(e) **MOLDED AND LATHE-CUT GOODS**.—All molded goods shall be of dimensions specified, free from surface imperfections, air checks, and pits.

BRANDING.

All branding and stenciling shall contain the words "U. S. A.,," (blank to be filled in with such words as may be designated in the detailed specifications), manufacturer's name, and date.

(a) **HOSE**.—All wrapped hose 25 feet or over in length shall have red (unless otherwise specified) brands inlaid in the rubber cover at two places on each length, approximately four feet from the ends, letters to be at least $\frac{1}{4}$ -inch high; hose less than 25 feet in length shall have one inlaid brand approximately in the center, unless otherwise specified.

(b) **BELTING**.—On the seam side of all belting over 4 inches in width, brands shall be inlaid in red rubber at least every 30 feet in letters at least $\frac{1}{4}$ -inch high. For belting 4 inches and under, the same words shall be stenciled in letters 1 inch high. All balata belting shall be branded with stencil only.

(c) **PACKING**.—All packing shall be stenciled in letters at least 1 inch high every fifteen feet for rolled packing and at least once on each sheet of asbestos compressed packing.

(d) **MOLDED AND LATHE-CUT GOODS**.—Molded and lathe-cut goods shall be branded as in detailed specifications.

MATERIALS.

(a) COTTON REINFORCEMENTS:

WRAPPED HOSE, BELTING, AND PACKING.—The cotton fabric layers shall be well, evenly, and firmly woven from good cotton, as free from unsightly defects, dirt, knots, lumps and irregularities of twist as is consistent with the best manufacturing practice and conform to requirements of detailed specifications.

BRAIDED HOSE.—Cotton braided layers shall be of such nature as to meet tests specified.

(b) RUBBER:

Rubber compounds shall in all cases be properly vulcanized and meet the requirements as specified.

When fine Para is specified it is understood to include only such grades of plantation *Hevea* rubber, as by virtue of their physical and chemical characteristics, are practically equivalent to fine para in its performance.

Where sulphur limits are specified, mineral fillers may contain barytes, but shall be practically free from sulphur in other

forms and from any substances tending to have a deleterious effect on the finished product. The sulphur in barytes shall not be included in the allowable sulphur content.

All percentages shall be based upon the weight of total rubber compound.

INSPECTION AND REHEARING.

Inspection and tests shall be made at place of manufacture unless otherwise specified, manufacturer providing a place for conducting test; also necessary help, cages, equipment, etc. In case it is not practicable to obtain suitable test specimens, the manufacturer shall furnish pieces $\frac{1}{4}$ by $1\frac{1}{2}$ by 8 inches, which he guarantees to be of the same material and equivalent cure as that used in article furnished.

Inspector shall, after tests, mark the remainder of samples with manufacturer's name, order, requisition, and item numbers and forward them to the properly designated organization for any further tests. Any lot which in any one or more tests proves unsatisfactory shall be retested by taking two additional samples which shall be at the expense of the contractor. Failure of either in any respect shall be cause for rejection.

No rehearing may be had on any rejected material unless by authority of the proper organization.

(a) **HOSE**.—Inspector may select three lengths at random from each and every shipment of 5,000 feet or less. A 3-foot section shall be cut from each length so selected for burst, after which further physical tests shall be made on the same sample, unless otherwise specified. Manufacturer shall refit couplings to said lengths which shall be accepted as full lengths provided they conform to specifications. When hose is furnished in lengths under 10 feet, extra lengths shall be furnished for test purposes at contractor's expense.

(b) **BELTING**.—Inspector may take a test sample 12 inches long from any part of each roll of belting, 4 inches and under in width; 4 inches long from belting over 4 inches in width.

(c) **PACKING**.—Inspector may select at random one test sample 10 inches long, cut across the full width of roll or sheet, from every lot of approximately 250 pounds.

(d) **MOLDED AND LATHE-CUT GOODS**.—Inspector may select at random one piece out of every 200 or less for tests.

TESTS.

All tests on material as a whole and on individual parts shall be performed according to methods adopted by the National Bureau of Standards as outlined in their circular No. 38, "Testing of Rubber Goods," in effect at date of opening of proposal.

Hydrostatic and tensile tests shall be in pounds per square inch. All samples which are subjected to a steam, oil, or aging test shall rest 24 hours before test specimens are cut.

(a) **FABRIC**.—The tensile strength shall be obtained by cutting strips from fabric 6 inches long, $1\frac{1}{4}$ inches wide and unraveled from each side to a width of 1 inch. Jaws of testing machine shall be more than 1 inch wide and 3 inches apart, separating at the rate of 12 inches per minute. Results obtained by taking the average of three tests each on both warp and filling shall be accepted as the tensile strength of the fabric. The tests shall be made when practicable after conditioning the fabric in an atmosphere having a relative humidity of 65 per cent and a temperature of 70 degrees F. for two hours. When not practicable to test as above, the fabric may be tested under existing humidity conditions and results corrected to a 6 per cent moisture basis by multiplying by the following factor:

100

$100 \text{ plus } 7 \times (\text{per cent moisture} - 6)$

NOTE.—The factor will be less than unity when the per cent moisture is greater than six and vice versa.

Moisture shall be determined by weighing six samples together before testing, and tensile strength immediately obtained in rapid succession. The broken samples (entire) after rupture shall be placed in a ventilated drying oven at 105 to 110 degrees C. (221 to 230 degrees F.) until weight is constant. Moisture present shall be calculated on this basis of the bone dry sample.

All fabric weights are given in ounces per square yard and shall be calculated on a 6 per cent moisture basis. Tolerance 3 per cent plus or minus.

(b) **HYDROSTATIC TESTS**.—To insure proper attachment of couplings when furnished with hose, pressure shall be held for three minutes on each length of hose; piece under test must not leak, sweat nor rupture the cotton canvas layers.

Bursting tests shall be made on samples 3 feet long, pressure being raised at rate of 300 pounds per minute.

(c) **FRICTION TESTS.**—Wherever practicable all tests shall be made on an automatic friction testing machine; ply separation being 1 inch per minute. Except in rubber-lined cotton hose, width of test specimen shall be 1 inch. In all cases strength of friction shall be the average value obtained on each test, and be given in pounds.

(d) **RUBBER.**—Longitudinal specimens shall be taken on hose and tubing under $\frac{1}{2}$ inches inside diameter; transverse specimens on all others.

Test specimens shall be buffed smooth to approximately not more than $\frac{1}{8}$ -inch in thickness and cut with a standard die having a constricted part $\frac{1}{2}$ by 2 inches, unless otherwise specified. Tests shall not be made until sufficient time has elapsed for rubber compound to recover from stretching or handling.

AIR BRAKE AND SIGNAL HOSE AND GASKETS.

War Department Specification No. 333-1-3—June 8, 1919.

(A) AIR BRAKE HOSE. (B) AIR SIGNAL HOSE. (C) AIR BRAKE AND AIR SIGNAL HOSE GASKETS.

GENERAL.—(a) This specification covers the requirements for air-brake, air signal hose, and gaskets.

(b) See War Department Specification No. 333-1-1, headed General Specification for Mechanical Rubber Goods, which is made a part hereof, except in such cases as the provisions below directly conflict. In such cases the word and meaning of this specification will govern.

CONSTRUCTION.—See General Specifications.

(c) Dimensions to conform to the table below.

(d) Cotton canvas layers shall be applied on a bias of from 42 to 46 degrees.

(e) Hose to be capped with same rubber compound as tube.

(f) Each length properly fitted with Master Car Builders' (MCB) standard air-brake or air signal couplings, if specified.

(g) If coupled, coupling shall be put in end near which brand is located.

(h) Gaskets must be uniform in size and section and of dimensions conforming to figure 1.

FIG. 1.

BRANDING.—See General Specifications.

(a) **HOSE.**—A 1-inch size label shall be applied 6 inches plus or minus $\frac{1}{2}$ -inch from one end of base with the top of lettering toward the center of the hose. Use the words, "Airbrake" on air brake hose; and the words "Air Signal" on air-signal hose.

(b) **GASKETS.**—See Figure 1.

MATERIALS.—See General Specifications.

(a) The fabric shall be made of long-staple cotton having not less than 16 nor more than 22 threads of 5-ply yarn per inch, each in warp and filling, and weighing not less than 19.8 ounces per square yard.

(b) Gaskets shall be made of such a compound that they will be tough and yet have enough elasticity to conform to the requirements for strength and elongation.

INSPECTION.—See General Specifications.

(a) Inspector may take one length at random from each shipment of 200 lengths or less of hose, from which he shall cut a 5-inch section. Two 1-inch sections shall be cut from this 5-inch piece for making friction, stretching, and tensile tests; the remaining 3-inch section shall be used for making additional tests which may be desired on the tube and cover.

(b) Inspector shall examine such lot of gaskets for size and workmanship, and shall take samples therefrom for tests.

TESTS.—See General Specifications.

(a) **HOSE.**

1. See the following table.
2. Test samples not to be buffed.
3. Stretching test.

Test specimens from tube and cover will be quickly stretched until the 2-inch marks are 10 inches apart and immediately released. They will then be remarked as at first within 10 seconds after starting to release and again stretched to 10 inches between the new marks, remaining stretched for 10 minutes. The specimens shall then be completely released, and within 30 seconds after starting to release the distance between the marks last applied will be measured, and the initial set shall not be more than $\frac{1}{4}$ -inch. At the end of 10 minutes the distance between the marks will again be measured, and the final set shall not be more than $\frac{1}{8}$ -inch. These test specimens may be cut from the tube and cover of the friction test specimen, but shall not be used for tensile test.

POROSITY TEST.

The remaining 17 inches shall be mounted and placed in a test rack, the circumference will be measured and the hose filled with air at 140 pounds pressure per square inch, the rubber cover shall be cut from clamp to clamp (taking care not to injure the duck) and this pressure maintained for five minutes. At the end of this time the hose will be submerged in water to determine whether the inner tube is porous. The escape of air through the tube shall be distinct enough so that the porosity will not be confused with the escape of air which is confined in the structure of the hose. In the event the hose fails on bursting test at the point at which cut was made for porosity test and a satisfactory hydraulic test is not obtained, the porosity and hydraulic test will be repeated on another piece of hose.

The section of hose which was used for porosity test shall also be used for the hydraulic tests.

If the tensile strength in pounds per square inch is greater than that required, the sample may be accepted providing the per cent increase in elongation is equal to or greater than the per cent increase in tensile in pounds per square inch above the minimum figure.

(b) **GASKET.**

DEFLECTION TEST.

Gaskets shall be subject to a deflection test which shall consist of suspending a weight of 20 pounds on the gasket. Under this load the increase in inside diameter shall not be more than $\frac{1}{4}$ inch, the measurement to be taken on the inside of the gasket with the load applied, and within 15 to 20 seconds after the application of the load. Support and the hook to which the weight is attached, shall have a diameter of $\frac{1}{4}$ inch.

TENSION TEST.

When the samples for test are received they will be examined for size and workmanship. The gaskets will be tested in tension in a manner similar to that of the tensile test of a single link of a chain. The half-links used to pull on the gasket will each be provided with 180 degrees fillet of the same diameter as the original inner diameter of the gasket—that is, the two semi-circular fillets of the pulling links will just fit the inside of the gasket. They should sustain an ultimate load of 100 pounds and show an elongation of original diameter of 350 per cent when tested as described above.

REJECTION LIMITS.

If any of the sample gaskets representing a lot should fail under a load of less than 90 pounds, or if the elongation is less than 200 per cent, the entire lot represented by the sample will be rejected. If the tensile strength of any sample tested is more than 125 pounds the lot will be rejected, unless the elongation obtained from such samples is more than 275 per cent.

STEAM HOSE.

War Department Specification No. 333-1-11—June 5, 1919.

GENERAL.—(a) This specification covers the requirements of

hose for general use in conveying steam or hot water under pressure; also for car heating purposes.

(b) See War Department Specification No. 333-1-1, headed General Specification for Mechanical Rubber Goods, which is made a part hereof, except in such cases as the provisions below directly conflict. In such cases the word and meaning of this specification will govern.

CONSTRUCTION.—See General Specifications.

(a) DIMENSIONS.—See the following table.

(b) No washers to be furnished.

BRANDING.—See General Specifications.

(a) Use the word "Steam."

MATERIAL.—See General Specifications.

INSPECTION.—See General Specifications.

(a) Inspector may select four lengths at random from each shipment of 100 lengths or less, and cut from each length selected a 3-foot section; two sections for steaming and the others for remaining tests.

TESTS.—See General Specifications and following table.

(a) TEST SPECIMENS shall not be buffed.

(b) STEAMING.—The ultimate tensile strength shall be determined by using the original thickness of samples in calculating the area. When calculating the tensile strength after steaming the test piece shall be considered as having the same thickness as that used before steaming.

A sample not less than 18 inches long shall be subjected to dry saturated steam in a digester for a period of 48 hours at a pressure of 45 pounds. After this test, the tube and cover shall not show any blisters, nor loosen from the plies of fabric. After resting, test piece shall be cut at least 4 inches from end and shall meet the figures indicated in the following table:

Size (I. P.)	5/8 INCH.	1 INCH.	1 1/2 INCHES.	1 3/4 INCHES.	1 7/8 INCHES.

(To be continued.)

Detection and Determination of Glue in Rubber Goods.¹

By S. H. Epstein and W. E. Lange.

GLUE is one of the latest additions to the long list of materials which have found application in rubber compounding. Its use has been attended with such striking success that it is becoming more and more prevalent in rubber stocks. As a consequence, the rubber analyst has another organic constituent to contend with in the determination of rubber hydrocarbon by difference. In order to be able to rely upon the figure for rubber hydrocarbon in a rubber mixing, it is necessary to know whether or not glue is present and when it is, the quantity must be determined.

The use of glue in rubber is such a comparatively recent thing that up to the present its detection and determination have received little attention. After one has found out that it is impossible to extract the glue from a cured rubber stock by means of boiling water, the problem of finding a satisfactory method takes on a formidable aspect. The problem presented two angles from which it could be attacked, namely: (1) by dissolving away the rubber and leaving the glue unchanged so that it could be dissolved in water and the glue determined by the weight of the water extract; (2) by determining the nitrogen content and calculating this to glue by means of the factor 5.56.

Believing that a Kjeldahl determination is too long for ordinary laboratory practice, we undertook to dissolve the rubber and attempted to get the glue in the residue. We found that the nitrosite and bromine methods of converting rubber into a soluble derivative could not be used since the glue seemed to be acted upon. The residue, which was left after the removal of the rubber compounds, when extracted and digested with hot water, gave extracts which contained less than 50 per cent of the total glue present; in addition,

this water solution would give none of the tests which are used to detect the presence of glue.

We next directed attention to rubber solvents, especially to those which would dissolve rubber at comparatively low temperatures, since a high boiling solvent decomposes the glue and is therefore inapplicable. After considerable experimentation it was found that cresol seemed to be satisfactory for the purpose. Rubber can be dissolved in it and the resulting solution, after it has been diluted with petroleum ether, can be filtered with ease. When glue is treated with cresol, it dissolves very readily but is precipitated in large part from this solution on the addition of petroleum ether. Experiments showed that on the average about 70 per cent of the glue could be precipitated from its cresol solution. The precipitation, therefore, could not be used as a quantitative procedure for a glue determination. However, this precipitate settled out very well and dissolved readily in water, giving a solution which answers all the tests for glue and the procedure can be used as the basis of a qualitative test for glue in rubber "mixings."

QUALITATIVE METHOD.

About 0.5-gram of the rubber sample to be tested for the presence of glue is digested in 25 cc. of freshly distilled cresol (boiling point 195 degrees C.) in a tall beaker for about 16 hours at 120 degrees C. This digestion is conveniently carried out by placing the beakers in a properly regulated Freas oven and allowing them to remain there over night. The cresol solution is allowed to cool and 250 cc. of petroleum ether is added slowly with constant agitation. When this solution has settled and the supernatant liquid is clear it is filtered through a Gooch crucible, using gentle suction. The beaker, contents and crucible are washed thoroughly with petroleum ether, then with hot benzol. The pad is removed from the crucible, placed inside of the beaker and digested

¹ Published by permission of the Director of the Bureau of Standards, Washington, D. C.

for several minutes with boiling water. The solution is filtered through a folded filter paper and evaporated to a volume not to exceed 150 cc. After it has cooled it is poured very slowly into a 5 per cent solution of pure tannic acid. In the presence of glue a cloudiness will appear at first and finally a precipitate as more of the glue solution is added. Large percentages of glue give heavy curdy precipitates while small quantities give decided cloudiness. In the absence of glue no permanent precipitate or cloudiness will appear in the tannic acid solution as the liquid is added to it.

In order to test the reliability of this qualitative procedure in detecting varying quantities of glue, mixings were made up which contained from 0.9 per cent to 10.0 per cent of glue, the balance of the compound being rubber (40 per cent), zinc oxide, magnesium oxide, gas black, mineral rubber and sulphur. They were run through the above procedure with the following results:

PERCENTAGE OF GLUE	VOLUME OF 10% SOLUTION OF TANNIC ACID REQUIRED FOR PRECIPITATION
0.00	Solution remains perfectly clear. No cloudiness.
0.9	Distinctly cloudy.
1.7	Cloudiness much denser than the above.
2.6	Cloudiness almost opaque. Precipitate.
3.5	Almost opaque. Precipitate.
4.3	Fairly heavy precipitate.
6.3	Heavy precipitate.
8.0	Very heavy precipitate.
10.0	Very heavy precipitate, which showed its curdy character very plainly.

The observations given above demonstrate conclusively that even the smallest practicable amount of glue can readily be detected by means of the procedure recommended here.

Many experiments were carried out in order to ascertain whether ingredients other than glue would dissolve in water and precipitate the tannic acid solution and in this way be mistaken for glue. It was found that magnesium oxide and calcium oxide dissolve to a considerable extent in hot water after they have been treated with cresol and the water solution that is obtained precipitates tannic acid when the reagent is not in excess. However, these precipitates are readily soluble in excess of tannic acid, while the glue-tannate precipitate is insoluble. Therefore it was recommended in the method given above that the solution to be tested for glue be added to the 5 per cent tannic acid solution. In this way the magnesium and calcium precipitates will be dissolved immediately as they appear and will become permanent only when a considerable quantity of their solutions has been added. In this way there will be no chance of mistaking them for glue since the glue precipitate will appear immediately and will be permanent, even when only a small quantity of its solution has been added. We have been unable to find anything else which would be present in this solution and would give a permanent precipitate when added to tannic acid. There is therefore no danger of misinterpreting the tannic acid precipitate; when it is obtained the presence of glue in the rubber mixing cannot be questioned.

QUANTITATIVE METHOD.

However, since the method is not quantitative, after the presence of glue has been proved, its amount must be determined. The only means we have found by which this can be done is to determine the nitrogen by the Kjeldahl procedure and calculate the amount of glue from it. This was found to be satisfactory and results were obtained which were usually 0.1 per cent to 0.2 per cent higher than the true value. The method is practically the same as that followed out in most laboratories. It is as follows:

Extract a two-gram sample with acetone for six hours, and then with chloroform for three hours and dry. Transfer the sample to a 750-cc. Kjeldahl flask. Add 25 to 30 cc. of concentrated sulphuric acid, 10 to 12 grams of sodium sulphate, and about one gram of copper sulphate. Place the flask on the Kjeldahl digesting apparatus, and heat gently

until the first vigorous frothing ceases, then raise the heat gradually until the liquid boils. Continue the boiling until the solution becomes clear. Allow the flask to cool to 40 degrees to 60 degrees (If allowed to become thoroughly cold the solution solidifies); dilute carefully with 150 cc. of water; allow to cool. Add 100 cc. of 50 per cent sodium hydrate solution, pouring it carefully down the side of the flask, so that it does not mix immediately with the acid solution. Add about one gram of granulated zinc to prevent bumping, and a piece of paraffine the size of a pea to diminish frothing. Connect the flask quickly with a condenser, the delivery tube of which dips into a 500-cc. Erlenmeyer flask, containing 50 cc. of tenth normal sulphuric acid, diluted to about 100 cc. Shake up the Kjeldahl flask and heat gently at first, increasing the flame as the danger of foaming over diminishes, finally boiling briskly until about one-half of the liquid has passed over into the receiver. Add one cc. of methyl red solution, and titrate the excess acid by means of standard sodium hydrate solution.

Calculation:

$$\frac{100 \text{ (cc. } H_2SO_4 \times \text{normality) - cc. NaOH} \times \text{normality}}{\text{Weight of sample}} = \text{Percentage glue.}$$

When light-gravity stocks are analyzed as above, experienced manipulators may not find glue when it is present. Such stocks float on the surface of the acid and allow the glue to be driven off by the heat before the nitrogen in it has been converted into ammonium sulphate and therefore no ammonia will be obtained. This difficulty can be overcome by constant agitation of the flask so that the rubber is kept moistened with acid until it is attacked. This laboratory has found it very convenient to add a small quantity of bromine to the rubber, which makes a brominated mass that sticks to the bottom when the acid is poured over it. There is therefore no danger of driving off any of the glue and the constant agitation and attention otherwise necessary can safely be dispensed with.

CONCLUSIONS.

1. The method presented will detect as little as 0.9 per cent of glue in a rubber mixing. It has been found, by experiment, that no substance other than glue will answer to this test when it is carried out as directed, and the method is reliable and convenient.

2. When glue is present in a rubber sample its quantity is arrived at by determining the nitrogen content by means of the Kjeldahl procedure and calculating this to glue. We have been able to find no other satisfactory quantitative method which would give the correct percentage of glue.

THE ADVANTAGES OF RECORDING THERMOMETERS.

As an illustration of what can be accomplished by watching results, the story is told of a large factory that had two vulcanizing departments in one of which an installation of six thermometers on the vulcanizers gave greatly improved results. In the other mill there were twelve vulcanizers, but because of some difficulty with the vulcanizer man, the superintendent hesitated to put in thermometers. Finally the man was induced to try one out, and after a short trial he equipped all his vulcanizers, and said that he wondered how he had gotten along without them. In explanation he stated that before he had recording thermometers installed, if a heat came out badly he would have to spend two or three days and sometimes nights personally investigating before the cause was discovered. But, with the recording thermometers, he first looked at the chart records and if these agreed with the predetermined temperature he knew that something was wrong with the mixture. Thus he was enabled to put his finger on the trouble at once and correct it without waste of time and without overmuch damaged material.

What the Rubber Chemists Are Doing.

AGING EXPERIMENTS ON VULCANIZED PLANTATION PARA RUBBER.

CAPTAIN B. J. LADON, F. I. C., AND F. W. E. DAY of the Experimental Vulcanizing and Chemical Laboratory, Agricultural Department, Federated Malay States, have reported their investigations on the aging changes which take place in vulcanized Para rubber, of which the following is a condensed account:

Preliminary investigations were made as a guide to a systematic examination of aging phenomena by experimenting on samples of rubber which had been considerably overvulcanized, since the changes would be emphasized in such samples and would be accelerated.

These samples consisted of "slab" rubber (coagulum matured for at least six days before machining to crêpe and crêpe rubber. The samples were prepared under comparable conditions and mixings containing ten per cent of sulphur and 90 per cent of rubber were prepared and cured at 140 degrees C. for varying periods of excessive cure. It was discovered, however, that no useful deductions could be drawn from the figures obtained owing to the remarkable increase in weight which occurred in the crumbled samples after storage, this is, on aging. These large increases in weight were not followed up in these preliminary experiments. The results indicated that much overcured samples would give even greater increases over similar periods.

As it was practically certain that the increases in weight were due to oxidation, the presence of substances soluble in water was tested by extraction of the samples in boiling water and the percentage of extract (by difference), the percentage of sulphur in the form of sulphate, and the total acidity of the extract of sulphuric acid were determined in terms of sulphur. The extraction with water was followed by extraction with acetone in order to obtain the free sulphur content and the additional matter extractable by acetone. A remarkable percentage of matter extractable by water was formed during the aging. The amount of sulphur present as sulphates in the aqueous extract was also marked. The acetone extract contained substances other than the sulphur and the resin which would be present in the original raw rubber (which ordinarily amounts to 2.3 per cent).

No further deductions can be drawn from the results since the increases in weight of the samples had not been determined. Some of these increases are nearly 40 per cent, which would bring the total sulphur content of the samples, calculated on original weight, up to about nine per cent, which still indicates an actual loss of sulphur on aging.

SCHEME OF EXPERIMENT.

As a result of the preliminary experiments mentioned above it was decided to trace the changes, due to aging, in the combined sulphur content, and the aqueous and acetone extracts, after making allowances for the oxidation or other changes in weight. For this purpose, two sets of about ten grams of crumbled rubbers were stored in specimen tubes. The first set was used to provide samples for analysis at different periods, while the second set was weighed at intervals but not otherwise disturbed. In addition, two grams of each crumbled rubber were left on watch-glasses and also weighed at intervals, as it was thought that aging (as indicated by increase in weight) would proceed more rapidly in the case of crumbs exposed to the air and under different conditions from those packed in closed tubes.

Further, eight-gram disks about five millimeters thick and 44 millimeters in diameter were also exposed in small watch-glasses. These were used in order to retain any sulphur exuding on the

surface due to the well known "blooming" of vulcanized rubber.

INCREASE IN WEIGHT ON STORAGE.

During the first ten days a slow increase in weight took place in all the samples, after which period the factors favoring a rapid increase are: (a) overcuring of the rubber; (b) freedom from complete exposure to the air. The most rapid increase was shown by the most overcured sample exposed on a watch-glass.

A similar relationship holds good between the tube stored and watch-glass stored samples for each pair of samples. In every instance the increase in weight of the tube stored samples overtook those of the watch-glass stored samples after periods ranging from one to two and one-half months, the period increasing according as the overcuring of the sample is less. Comparing the cures obtained by plotting the data from these samples shows that excessive overcuring appears to be the principal factor affecting the type of curve. In the case of watch-glass stored samples the tendency to keep below the tube stored samples for an indefinite period, that is, to gain weight more slowly, was very marked.

It seems clear that the explanation lies in the fact that while increases in weight are proceeding uniformly in both sets of samples, a loss of weight is proceeding at the same time in the freely exposed samples, which leads to an apparent retarded increase.

Results from four samples investigated indicated that overcuring beyond a certain point ceases to increase the capacity of a rubber to gain weight during storage, and warrants the assumption that excessive overcuring does actually decrease the capacity of aging as measured by weight increase.

COMBINED SULPHUR CONTENT.

Only the much overcured crumbled samples showed combined sulphur changes on aging. Normally cured samples did not show much variation in this respect, although some changes could be traced. These changes were, however, small and irregular.

It was noticed generally that the color changes of the samples of stored crumbs which took place were greatest in those portions in contact with the sides of the tubes, that is to say, the portions exposed to light. The central portion or core of the tube-stored crumbs appeared to be unaffected in the undercured samples. The overcured samples, however, broke down to a powder. Probably, therefore, if given sufficient time, the full aging effect of 40 per cent increase in weight would develop in all the samples.

From a study of the changes in sulphur content and weight it is evident that very complex changes are proceeding in which the loss of sulphur compounds at one time exceeds, proportionately, the loss of other constituents. It is also clear that at a later stage the conditions are reversed, leading to an increase in sulphur content, and throughout the whole period of change a steady gain in weight, due presumably to oxidation, is taking place.

AQUEOUS AND ACETONE EXTRACTS.

Some idea of the changes in the proportions of sulphur soluble in water and in acetone can be obtained by extraction in boiling water and acetone. Close analysis of the results is impossible, owing to the weight increases, and it is not possible to eliminate the effect of these changes. The results show that complex changes are occurring which it is impossible to examine at this stage of the work.

CONCLUSIONS.

It is not yet possible for the authors to draw very definite conclusions, since the changes taking place in vulcanized rubber on aging are obviously complex. They have placed their results on record because the literature on this subject does not appear

¹"Journal of the Society of Chemical Industry," September 15, 1919, page 339T.

to contain any results similar to those they have obtained in respect of (1) the large increases in weight on storage, (2) the formation of a large aqueous extract in the samples, and (3) the conversion of the sulphur to a large extent into aqueous soluble compounds.

PRACTICAL SYNTHETIC RUBBER.

The practical manufacture of synthetic rubber in Germany under war conditions is described in "*Gummi-Zeitung*," July 11, 1919, page 750. The most available source was found to be calcium carbide, from which methyl rubber was produced from acetone in accordance with the following procedure:

SYNTHESIS OF RUBBER.

The acetylene gas produced from calcium carbide and water changes in the pressure of contact bodies by the addition of water into acetaldehyde. This is oxidized with acid into acetic acid, which is separated into acetone by elimination of carbonic acid by blowing over a contact substance. This liquid is diluted with benzol and under proper conditions is reduced in the presence of aluminum scrap into pinacoline, a crystalline substance of 42 degrees C. melting point and 170 degrees C. boiling point.

After reduction the mixture is diluted with water and distilled. Any undecomposed acetone-benzol mixture is first removed and later parted by separate distillation. Only on further distillation are these converted into oils, boiling at a higher temperature, most of which contain pinacone. These higher boiling oils are treated with water, whereupon pinaconehydrate appears as a white crystalline product. This is then treated with acid salts on free acid to obtain dimethyl butadiene having a boiling point of 70 degrees C. and is freed by fractional distillation from the by-product pinacoline, a mixed ketone boiling at 106 to 120 degrees C. The dimethyl butadiene is placed in vessels where by the addition of a small quantity of a catalyst it is polymerized into methyl rubber. The total amount of methyl rubber obtainable from acetone is about 40 per cent.

COMMERCIAL VARIETIES.

Methyl rubber was produced by the *Farbenfabriken*, Elberfeld, in two qualities, one designated as "H" and the other as "W." The H variety results from cold polymerization (about 35 degrees C.) and is adapted to the manufacture of hard rubber, while the W variety results from warm polymerization (about 70 degrees C.) and is suitable for making soft rubber goods.

PROPERTIES AND DEFECTS.

Both sorts of synthetic rubber require a long time for polymerization, the H three and one-half months and the W as long as five months. Neither form is stable but oxidizes readily in the air as soon as formed; consequently a preservative agent is required to prevent this. At first, aldehyde ammonia was used, next piperidine, followed by experiments with other agents. At the same time a vulcanization accelerator is incorporated.

On account of their instability these rubbers are shipped in tightly closed zinc-lined iron containers.

H SYNTHETIC RUBBER.

More of the H grade is used than of the W. It is yellowish in color and very dry and stiff because the masses are heavily pressed together, expelling the air from the interior to secure protection against oxidation. The characteristic properties of extensibility and toughness which mark natural rubber are present in much less degree in methyl rubber. The latter crumbles at first on the mill almost completely and reunites into a sheet only after prolonged milling.

The milled rubber becomes capable of taking up compounding ingredients only after an hour of milling. Likewise, long milling is found necessary to eliminate porosity and secure solidity in molded work. The milling should take place only on moderately warm mills. Under hot milling, H rubber becomes sticky. In order to increase its capacity to absorb filling materials it is found advisable to wash the rubber thoroughly. It then becomes

necessary to dry it completely at low temperature to avoid oxidation and conversion of the rubber into a dark sticky mass in which condition it is not suited to vulcanization and produces only porous products. Washed and dried H rubber is even softer and more elastic after vulcanization than products made from the same rubber unwashed.

When heated in the air to its melting point, H rubber oxidizes and the rubber molecule breaks down, as inferred from the fact that when similarly heated at considerable temperatures in inert gases such as nitrogen, carbonic dioxide, and sulphuretted hydrogen this effect is not observed.

To increase the ability of the rubber to absorb compounding ingredients the *Farbenfabriken*, Elberfeld, recommends the addition of a certain percentage of their ER solution or from five to ten per cent of pinacoline. The addition of a small amount of reclaimed rubber permits the more ready absorption of large quantities of mineral ingredients.

To increase the elasticity of synthetic rubber a number of minerals are recommended such as diphenylamine, diamethyl-aniline and toluidine.

The chief accelerator employed is the preparation known as Vulcacin. This material also acts powerfully in the acceleration of the cure of natural rubber.

The W variety of methyl rubber is much darker than the H grade. It is reddish brown in color. In structure it is net-like and is strongly suggestive of natural rubber. On the mill rolls it is tough and would readily be mistaken for natural rubber. It differs, however, by reason of its internal stickiness. On its torn edges it presents fine silk-like threads. While both grades are suitable for mold work the W grade is not so readily moldable as the H grade. In the case of plied up articles extra pressure must be used during the vulcanization to insure adhesion of the component parts.

NATURAL AND ARTIFICIAL RUBBER.

The investigation of A. Tschirch on the constitution of natural and artificial rubber has been published in "*Schweitzer Chemiker Zeitschrift*," 1919, pages 153-156. In abstract his results are as follows:

The term rubber covers a variety of raw materials. Those of African origin furnish colloidal solutions with chloroform, whereas *Hevea* and *Manihot* rubbers are only slightly soluble, though they swell up considerably in that solvent. The term "synthetic" rubber is incorrect because the synthesis is confined to a single constituent which the author designates as "caoutchougutta," a mixture of hydrocarbons in various forms and in varying quantity in one and the same kind of rubber.

The substance known as synthetic rubber is not identical with the caoutchougutta of the natural article. Natural rubber is by no means the unaltered sap of rubber plants. It contains protolactoretin, and undergoes alteration shortly before it exudes into the air, further changes ensuing during coagulation and smoking. Protolactoretin is a polymer of isoprene, and is not the same in all rubber plants. Commercial rubber is regarded by the author as a semi-manufactured article rather than a natural product.

According to the author, synthetic rubber is analogous to Pará rubber, the artificial caoutchougutta being derived from aliphatic hydrocarbons (mythylated butanes). The varying solubility of rubbers probably may be due to the structural conditions of the colloid substance. Rubber occupies an intermediate position between the emulsoids and the dispersoids, and is heterogeneous, containing at least two structural phases, a solid colloidal solution. Under the microscope Pará rubber that has been extracted with chloroform is seen to consist of a fine network of minute straight and bent rods, forming the turgescient component, which, however, in the case of extracted synthetic isoprene rubber, is irregular and not reticulated.

The author considers that the peculiar structure of Para rubber is the cause of its superiority to synthetic and the other natural rubbers. A feature common to both Para caoutchou-gutta and that from synthetic isoprene rubber is the presence of a constituent (A-caoutchougutta) soluble in chloroform, and a second (B-caoutchougutta) insoluble but turgescens in that solvent, this second constituent acting as a solvent of the first and forming the reticulate structural component. Methyl rubber contains no turgescens component and dissolves slowly and completely to a viscous, clear colloidal solution in chloroform. Great stress is laid on the nature of the turgescens component as an indication of the technical value of rubber. The proportion of this component is lowered by the process of mastication.

CHEMICAL PATENTS.

THE UNITED STATES.

PROCESS OF RECLAIMING PLASTIC RUBBER FROM FABRICS which consists in progressively disintegrating the fabric in presence of water and simultaneously stripping the plastic rubber from the fabric and from the threads and fibers resulting from its disintegration. (Theodore F. Furness, Cynwyd, Pa., assignor by mesne assignments to Acushnet Process Company, New Bedford, Mass. United States patent No. 1,321,200.)

PROCESS FOR RECLAIMING RUBBER AND COTTON FROM RUBBER WASTE which comprises the steps of wetting the waste, passing it between rollers whereby the waste is formed into a sheet, and feeding such sheet gradually to a high speed picker causing the fabric to be torn from the sheet in the form of threads and fibers while the rubber is torn from the sheet in small balls and particles. (Philip E. Young, Fairhaven, Mass., assignor to Acushnet Process Company, New Bedford, Mass. United States patent No. 1,321,201.)

RECLAIMING RUBBER.—In the manufacture of rubber a method which consists in adding proteid to a fresh rubber stock prior to the vulcanization thereof, vulcanizing the fresh product, reclaiming the vulcanized product and revulcanizing the reclaimed product. (Clayton W. Bedford, assignor to The Goodyear Tire & Rubber Co., both of Akron, Ohio. United States patent No. 1,321,501.)

RUBBER SUBSTITUTE.—The process and product which consists in combining fish oil and sulphur in the presence of heat and resubjecting the resultant combination to heat under pressure. (Morton Gregory, assignor to Western Rubber Co., both of Tacoma, Washington. United States patent No. 1,321,788.)

PROCESS FOR DEVULCANIZING RUBBER.—Comprising boiling rubber with a liquid of which a large proportion is a hydrocarbon of a viscid and gummy nature, forming a yeasty froth on the surface of the liquid and having an affinity for sulphur, under the conditions created, greater than the lessened affinity for sulphur possessed by the rubber, whereby combined sulphur will be liberated from the rubber. (Cyrus Field Willard, San Diego, California. United States patent No. 1,322,077.)

DEVULCANIZING PROCESS AND PRODUCT. Boiling vulcanized rubber with a viscous mixture of a tar and a flux of a liquid hydrocarbon in the presence of water. (Cyrus Field Willard, San Diego, California. United States patent No. 1,322,151.)

PROCESS FOR DEVULCANIZING VULCANIZED RUBBER, comprising effecting the liberation of more or less of the combined sulphur by boiling the rubber with an emulsoid colloid solution and a detergent or cleansing solution. (Cyrus Field Willard, San Diego, California. United States patent No. 1,322,152.)

TREATING RUBBER by incorporating therewith sulphur and titanous oxide and vulcanizing the mixture. (Louis E. Barton, Niagara Falls, New York, assignor to The Titanium Alloy Manufacturing Co., New York City. United States patent No. 1,322,518.)

PLASTIC COMPOSITION consisting of caoutchouc, wax, non-drying oil, inert filler, and coloring matter. (Stanley H. Rood, Hartford, Connecticut. United States patent No. 1,322,823.)

THE UNITED KINGDOM.

RUBBER COMPOSITION consisting of powdered slate mixed with rubber, rubber substitute or waste or recovered rubber and sulphur. Example: 50 parts of slate, 35 of rubber and 15 of sulphur yield a product suitable for packing, mats, etc. (W. F. Macdonald, 53 Palace Court, Bayswater, London. British patent No. 130,528.)

GERMANY.

PROCESS FOR MAKING HARD AND SOFT RUBBER FACTICE.

SOFT FACTICE. Into a mixture of 100 parts of linseed oil, 10 parts of acetic acid, and 10 parts of a 10 per cent solution of ammonia are poured in a thin stream 20 parts of chloride of sulphur thinned with 20 parts of water and neutralized with 20 parts of a 15 per cent solution of ammonia. The mixture is steamed and dried until thick flowing. The product is a very elastic, soft, rubbery mass, which, on being heated to 240 degrees C., becomes homogeneous and weatherproof. Formic, acetic, or other fatty acids, or unsaturated acids of the acetic series, may also be used.

HARD FACTICE. Liquid emulsions prepared according to above example are neutralized with ammonia, steamed until they are plastic, and mixed with three parts by weight of lead, zinc or iron oxide and sulphuret of antimony. The mass is pressed in vacuum at 50 to 70 degrees C., then dried and pressed for six hours at six or more atmospheres. The result is a solid rubber-like mass which can be used as a substitute for hard rubber. (H. Otto Traun's Research Laboratory, Hamburg. German patent No. 314,560. February 25, 1915.)

OTHER CHEMICAL PATENTS.

GERMANY.

PATENTS ISSUED, WITH DATES OF APPLICATION.

317,641. (April 16, 1916.) Artificial arm. Allgemeine Krankenhaus-Einrichtungsgesellschaft m.b.H., 20-21 Johanniessstrasse, Berlin, and Karl Albert Scherer, 113 Hartwigstrasse, Berlin-Pankow.

317,695. (April 28, 1917.) Packing with rubber ring, particularly for coolers with interchangeable parts. Sueddeutsche Kuehlerfabrik, Feuerbach, Wurttemberg.

LABORATORY APPARATUS.

AN ALUMINUM WATER STILL.

PURE DISTILLED WATER especially free from potassium, sodium and copper is obtainable by the use of an aluminum still described by T. O. Smith in "The Chemist-Analyst."

The apparatus is set up as follows: a hole is punched from the inside of an aluminum tea kettle, about two inches from the bottom, with a sharp punch so that the edges of the hole are smooth, without cracks and flared as much as possible. Into this hole is fitted an aluminum tube of convenient length for connecting a leveling bottle as shown in the drawing. The tube is secured and the hole made water-tight by wrapping the flared edges and the tube with cotton yarn to a thickness of about one-half inch. A Liebig condenser is fitted with an inner tube of aluminum into the spout of the kettle, and connection made tight with cotton yarn wrapping. The lid is held on by small clamps. A three-hole Woulfe bottle connected with the leveling tube from the kettle receives the overflow from the condenser through a rubber tube and maintains the water in the kettle at the level of the overflow opening from the bottle. This overflow opening is provided with a curved glass tube for equalizing the air pressure in the bottle. In this manner the waste water from the condenser is made to replace the water in the kettle as fast as it is removed by distillation.

A NOVEL STILL.

New Machines and Appliances.

MACHINE FOR CUTTING PRESSED ON TRUCK TIRES.

SERVICE stations find it frequently impossible to press off old tires no matter what size press is used. This is especially true in the case of "stickers" or tires on which the rim has been turned by contact in the street with stones, etc. Very few stations are equipped with presses of sufficient throat opening to handle large size dual tires and in trying to press off these tires the press is broken. To afford a simple and efficient means for overcoming these difficulties the machine here pictured has been especially designed for cutting off pressed-on truck tires.

SOLID TIRE CUTTING MACHINE.

The basic principle of the power hack-saw has been combined with the mechanical features necessary to perform efficiently the wide and varying work required by a machine of this type. The machine is of heavy construction and designed with the idea of giving dependable service under the hardest working conditions.

The machine has a movable platform which may be raised and lowered so as to take care of any size or height of truck wheel now in use, and it is also of sufficient capacity for the widest single or dual truck tire. It is so arranged that when the blade finishes the cut, it is parallel with the felloe of the wheel and automatically stops just before striking the felloe. In approximately ten minutes' time the machine can cut a dual tire seventeen inches wide. (Racine Tool & Machine Co., Racine, Wisconsin.)

RECORDING THERMOMETERS FOR RUBBER VULCANIZERS.

Everywhere to-day manufacturers of rubber goods realize that temperature has a great effect on the chemistry of vulcanization, and that by watching and controlling it they can produce the best quality and reproduce it at will. Indeed, given the proper temperature, even an inferior grade of material can be used with the confidence of turning out a good product. So vital is the question of temperature that more vulcanizers than ever are being equipped with recording thermometers which give accurate information that forms the basis of all intelligent control.

The accompanying illustration shows a recording thermometer and an installation of fourteen of these on rubber vulcanizers at a large footwear plant in Massachusetts. The instruments, equipped with patented improvements, are of the inverted type and have variable lengths of lead-protected con-

FOXBORO RECORDING THERMOMETER.

necting tube and lead bulbs for protection against the fumes from the cure. These thermometers depend for their operation upon the pressure of a saturated vapor of a volatile liquid. They are so constructed as to take care of any temperature from plus-50 degrees to plus-400 degrees Fahrenheit, or the corresponding ranges in Centigrade or Réaumur. The charts have increasing graduations that make the upper or working portion of the scale clear and open, which is an advantage when close readings are a matter of vital importance.

An automatic temperature controller which not only controls the temperature but also the duration of the heat may be sup-

FOOTWEAR VULCANIZER EQUIPPED WITH RECORDING THERMOMETERS.

plied, thus making the curing of rubber independent of human conditions and eliminating all hand control. (The Foxboro Co., Inc., Foxboro, Massachusetts.)

VERTICAL CEMENT CHURNS.

Vertical cement churns are used in rubber mills when the making of certain solutions requires this particular type of mixer.

The machine here shown is supplied by the makers in three sizes, the steel tanks measuring, respectively, 24 by 24, 36 by 36, and 48 by 48 inches. They are all equipped with belt-driven agitators and gate valves for drawing off the solution.

While stock mixers are built with steel tanks, they are also furnished with wood tanks, vertical shafts and stirring devices made of wood for use in connection with materials that attack iron. (The Patterson Foundry & Machine Co., East Liverpool, Ohio.)

TYPE "E" MIXER.

SECTIONAL TIRE CORE REMOVER.

The removal of sectional cores from tire casings after curing is facilitated by the ingenious device that is adjustable to any size core, and which is shown in the accompanying illustration.

Small holes in which the prongs of the puller are inserted may be drilled in the core sections, or the raised parts of the core may be gripped by the prongs that are operated by the hand-lever attachment. By means of this lever the sections are easily removed without kinking the tire beads. (Gillette Rubber Co., Eau Claire, Wisconsin.)

CORE PULLER.

BRAKE LINING CUTTER.

This is a handy bench device that was primarily designed to cut brake linings and intended to be used by the dealer or garage man. In fact, the rubber manufacturer also could undoubtedly find this tool adaptable in many ways, preferably as a hand stock cutter.

The cutter blade is of steel, $3\frac{1}{4}$ inches wide, and may be easily removed for sharpening. The hand lever is 15 inches long, enabling the operator to cut easily brake lining up to one-half inch in thickness. (The Raybestos Co., Bridgeport, Connecticut.)

RAYBESTOS CUTTER.

tribution of the heat are controlled at one source.

ILGAIR UNIT SYSTEM OF HEATING.

The question of heating is of importance to every rubber manufacturer, and particularly so in view of the high cost of fuel. Direct heating requires numerous radiating surfaces, and blast heating with its long ducts and high-power blowers is costly. According to the present system each unit constitutes a separate heater, and both the volume and the dis-

PEDESTAL SUSPENSION.

CEILING SUSPENSION.

This unit heater is a cabinet, open at both ends, containing a two-stack radiator and a motor propeller fan. The air is drawn in over the heated coils at about 1,000 feet per minute and discharged at about 2,500 feet per minute. Stationary deflectors spread the air in a horizontal plane, while a movable one controls the placement of the air, thus controlling the direction of the heat. As the air at the breathing line warms up, the deflector is raised and the air current straightens out to a distance of 50 to 60 feet, the low velocity precluding drafts or dust circulation on the floor. There are two different types—a pedestal model for floor installations and one for ceiling suspension. (Ilg Electric Ventilating Co., Whiting and Wells streets, Chicago, Illinois.)

MISCELLANEOUS PATENTS.

ELASTIC FABRIC FOR TIRE BUILDING.

FOR THE PURPOSE of at once avoiding waste and rendering elastic the splice formed by joining bias-cut strips of frictioned fabric for making tires and similar articles, the simple device of slitting the selvages of the fabric at frequent intervals

TIRE BUILDING FABRIC.

has been patented. The result is that such a selvage edge bias splice is as elastic as any other portion, the joint is less bulky and all waste is eliminated. (Kurt W. Jappe, assignor to The Miller Rubber Co., both of Akron, Ohio. United States patent No. 1,318,876.)

MACHINERY PATENTS.

DEMOUNTABLE RIM FOR SOLID TIRES.

THIS is a detachable rim for solid tire wheels and may be applied to any wheel that has an ordinary turned rim intended to fit a pressed on tire but calls for a tire of a little larger diameter than that of the wheel. The space between the rim and the inside of the band of the tire is taken by an annular ring of steel or other cast metal which is wedged in place and thus holds the tire in position. The grooves for the wedges are spaced around the ring, being cut alternately on the outer and the inner surface; they taper in depth across the rim but their sides are parallel. Neither the rim of the wheel nor the inner circumference of the band tire is cut.

SOLID TIRE DEMOUNTABLE RIM.

The rim is turned internally so that it slides easily over the outer surface of the wheel rim; externally its dimensions allow the band tire to slip

easily into place. The wedges, which are made all of the same size, are then driven into place and may be fastened permanently by screws. (The Dunlop Rubber Co., Limited, and W. W. Haniell, 14 Regent street, Westminster, London, England, British patent No. 126,792.)

PNEUMATIC TIRE TREAD SLICING MACHINE.

In reclaiming scrap tires the tread is removed, prior to placing the carcass in the acid baths, by slicing off the tread by hand which results in uneven work and is a relatively costly operation. The machine here shown in sectional elevation severs the tread by action of a reciprocating knife and provides means for supplying water to facilitate the cutting operation.

TIRE TREAD SLICER.

roller B. The vertical adjustment of the lower roller A is made by the hand-wheel D.

When power is applied, the knurled portions of the lower roller engage the inner surfaces of the tire side walls, drawing the tire between the rollers while the reciprocating knife slices the tread. A pump supplies a continuous flow of the cutting lubricant that collects in a sump, is strained and delivered to the pump line for reuse. (Edward Nall, assignor to The Goodyear Tire & Rubber Co., both of Akron, Ohio. United States patent No. 1,319,301.)

RUBBER-MAKERS' CRAYON.

While it would seem at first thought that any sort of marking crayon would be adaptable to rubber workers' use, it is, in practice, quite to the contrary. The fact is, a high-grade wax

"SUPERMARK" CRAYON.

crayon with unusual lasting qualities is required and one that can be efficiently used for marking hot or cold rubber sheets, molds, cores, etc.

The crayon here pictured may be obtained in the four following colors: black, yellow, blue, and red. (Zelnicker Crayon Works, St. Louis, Missouri.)

ACCESSORY MANUFACTURERS AT THE TRACTOR SHOW.

Arrangements have been made with the Kansas City Tractor Club whereby members of the Motor and Accessory Manufacturers' Association are to participate in the Fifth Annual Tractor Show to be held in Kansas City from February 16 to 21, inclusive, 1920. Applications and diagrams will be forwarded to members shortly, and indications point to a large and representative number of exhibitors.

The following are the shows sanctioned by the Motor and Accessory Manufacturers' Association:

- New York (both passenger and truck shows) Jan. 3-10.
Chicago (both passenger and truck shows) Jan. 24-30.
Minneapolis—January 31-February 7.
Kansas City—February 16-21.
Boston—March 13-20.

This is the largest number of shows ever sanctioned by the Association for any one year. Applications for space already received for the New York, Chicago and Boston shows are exceeding all previous records, both in the number of exhibitors and the amount of space applied for. It is expected that this will also hold true of the Minneapolis and Kansas City shows.

New Goods and Specialties.

AN INHALER WITH RUBBER VALVES.

A device intended for use with a remedy to relieve by inhalation diseased conditions of the air passages, et cetera, is illustrated below. It is made of metal and has a strap to hold it in place over the nose, the strap passing

MAN HEEL AUTOMATIC INHALER.

around the head. Provision is made for the application of a cleansing antiseptic to absorbent material stored within the inhaler, which can be renewed frequently. Two rubber valves form the automatic feature of the inhaler, one of these permitting the inhalation of fresh air, which the inhaler filters and medicates, and the other, the exhalation of the gases formed by breathing. This inhaler may be worn when awake or asleep. (Frederick Heilman Co., 138 Market street, Johnstown, Pennsylvania.)

A NEW CORD TIRE SOLE.

A cord tire sole made from new live rubber and usual standard cord tire fabric is shown in section in the accompanying illustration. It fits over all sizes of cord tires and is held in place by a specially prepared cold-cure self-vulcanizing cement which causes the tire sole to become an integral part of the tire. In applying, the selected worn casing is properly prepared by

buffing off the surface until it is clean. Then the tire sole is placed entirely over it and cemented to it. The tire is then held to the rim by inflation in the usual manner. This particular tire sole

is patented and the inventor has put the accessory on the market with a "no limit mileage guarantee." (Sturges Tire & Rubber Co., Oakland, California.)

STURGES CORD TIRE SOLE.

TRANSPARENT TOBACCO POUCHES.

What is said to be a popular article in England is a transparent rubber tobacco pouch, some of which are red. Being transparent, these pouches enable the user to note the amount of contents. ("The India-Rubber Journal.")

A BRITISH MOTOR WATERPROOF.

A new waterproof outfit for motoring, which was shown at the English motorcycle show, recently held at Olympia, is described as follows in "The India-Rubber Journal," London: "Double-breasted jacket, a garment shaped to the figure, having two expanding panels, two skirt vents, and deep pouch or bellows-shaped pockets besides an outside breast pocket; worn with a wide-fitting seatless trouser."

AN ATTACHMENT FOR PENCILS, ETC.

An attachment device to facilitate the gripping of penholders, pencils, and other similar articles consists of a soft rubber sleeve which, because it is rubber, is adaptable to pencils or penholders of different diameter. There are longitudinal slits which facilitate adjustment and use. This device has been patented in the United States. (M. J. McGuigan, Ashland, Wisconsin.)

RUBBER SLEEVE FOR PENCILS.

"TIRE LIFE."

A new compound intended to be used as a preservative of all kinds of rubber goods, including belting, hose, valves, valve seats, gaskets, packing, matting, rubber boots, overshoes, etc., and particularly tires is called "Tire Life." It is applied with an ordinary paint brush after the articles have been first washed and dried. (Camphus, Rives & Gordon, Inc., 81 New street, New York City.)

MASON TRUCK CORD TIRE.

A TRUCK CORD TIRE.

The growing popularity of cord tires of the pneumatic type for use on trucks and other heavy motor vehicles is responsible for many manufacturers of other tires going into the manufacture of this particular type. The accompanying illustration shows the tread design of one of the new pneumatic truck cord tires. (The Mason Tire & Rubber Co., Kent, Ohio.)

THE "TRIANGLE TREAD" CORD TIRE.

Another cord tire of pleasing design is known as the "Triangle Tread." The well-known resiliency of the cord tire is produced by the method of construction whereby rubber-coated cords are embedded in rubber without the fabric construction so familiar in the older type of tires. Additional resiliency with less inflation is provided by the cord tire.

The tread design of a tire is intended to make it grip the road surface firmly and without the disagreeable and dangerous slipping which automobilists so greatly dislike in tires upon which they depend to give them the maximum of service and safety. (The Gordon Tire & Rubber Co., Canton, Ohio.)

GORDON "TRIANGLE TREAD."

A BELT WITH A GRIP.

A belting intended for wear with ladies' skirts is made in the usual way, but has incorporated in it a flexible boning that adds to its rigidity and at the same time permits it to yield freely to the movement of the body. Over each bone is a strip

"GRIPFAST" SKIRT BELTING.

of rubber fabric containing a number of rubber grips which, when brought in contact with the garment, keep it in position. This belting worn with shirtwaist and skirt, keeps the waist down as well as holding the skirt up. The invention can be washed and boiled, the manufac-

turer claims, without losing any of its shape or rigidity. The "Gripfast" belting is put up on reels containing twelve yards and is packed one reel to the box. The idea is patented. (David Basch, 23-25 East 21st street, New York City.)

"NITREX."

A substance to prevent the oxidation of tires and the accumulation of rust on tire rims has been developed under the trade name "Nitrex." It is intended especially for painting spare tires, is applied with a brush, and dries instantly. It produces a jet-black, brilliant surface, but comes off when the tire is put into use, leaving the spare like the other tires in appearance. (The Sterling Varnish Co., Pittsburgh, Pennsylvania.)

SQUEEGIE HEEL.

ANOTHER NON-SKID HEEL.

A rubber heel embodying the popular non-skid element employs a series of V-crumps as the patented feature in accomplishing its purpose. It is claimed by the manufacturer that these heels will prevent slipping on wet or greasy pavements and ice and snow. The V-crumps, it is said, grip the pavement securely until the foot is released for the next step. A similar construction

has been used by some English designers in constructing rubber heels, the V-cuts being disposed at varying angles to produce different designs. (The Squeegie Heel Co., Elyria, Ohio.)

ATTRACTIVE WHEELS.

Simplicity of design in any article makes

THE "DISTEEL" WHEEL.

for elegance. The wheel shown here has not only simplicity of design but of construction likewise, and the result is pleasing.

The claim made by the manufacturer is that these wheels are strong and very light, being proportionately lighter on heavy cars than the ordinary wheel equipment. They likewise facilitate the changing of both wheels and tires. (Detroit Pressed Steel Co., 1802 Mt. Elliott avenue, Detroit, Mich.)

"A TIRE WITHIN A TIRE."

An inner tire made of first-class fabric and rubber tends to prevent punctures, blow-outs, rim cuts, etc., in the tires with which it is used. In the three and three and one-half inch sizes it is made with three layers of new fourteen-ounce fabric, while the four-inch and larger sizes have four layers. The outside is a coat of soft cushion rubber to prevent stone bruises, and is roughened to prevent friction. This, the manufacturer claims, tends to prevent the creation of heat inside the casing because the "Planet Sub-Tire" does not slip. No cement is required or used to keep this inner tube in place. (Planet Rubber Co., 125 East Ninth street, Los Angeles, California.)

THE "PLANET SUB-TIRE."

"LIGHTNING" LETTER-OPENER.

An electrically operated letter-opener handles five hundred letters a minute. The machine is made by the Bircher Co., 110 West 34th street, New York City, and is operated by a Westinghouse motor mounted within the case, connected with an ordinary lamp socket.

The mechanism is extremely simple, so that almost anybody can use the device. The envelopes, placed on the feed table, are conveyed by a rubber feeding belt between two cutting knives, which clip off the exposed edge. In a hand-operated machine of the same type, a rubber transmission belt is used on

"LIGHTNING" LETTER OPENER.

the driving pulley. (Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania.)

A CURLING SHOE.

The manufacture of footwear is specialized more and more each year. One of the winter sports, more popular in Canada

than in the United States, is curling, a game played on smooth ice, and therefore requiring the contestants to wear warm and anti-slip footwear. The shoe here shown is of black cashmere, with heavy felt, semi-double sole, and high strong foxing. It is lined with felt and is worn not as an overshoe but as a shoe, with a heavy stocking. (The Canadian Consolidated Rubber Co., Ltd., Montreal, Quebec.)

"NEFTUNE" CURLING SHOE.

Activities of the Rubber Association of America.

THE DIVISION MEETINGS of The Rubber Association of America held during December were devoted to routine matters and the business necessary in anticipation of the annual elections to be held early in January.

Active preparations are being made for the coming annual meetings and the 20th annual dinner of the Association, that will undoubtedly be the largest and most representative gathering of rubber men known to rubber history.

STATISTICS OF THE RUBBER INDUSTRY.

NEW YORK, December 16, 1919.

To all manufacturers of rubber products and reclaimed rubber:

There is enclosed an analysis of the statistics compiled from the returns to Questionnaire No. 100 covering the total average daily number of employees, total sales value of production and classified consumption of crude rubber, during the year 1918.

This data is sent you with a new Questionnaire, No. 101, enclosed with my letter of this date, as a report to which our members are entitled by reason of their support in supplying statistics for individual companies, from which this compilation of totals was made.

herewith Questionnaire 101, covering the first half of the year 1919.

It is intended that a questionnaire similar to No. 101 (submitted herewith) will be sent out every six months. This questionnaire has been carefully prepared in order to reduce to a minimum the information desired, but at the same time to provide the basis for a comprehensive picture of the whole industry. In designing the questionnaire, your directors and their special committee on statistics have had in mind the desirability of accumulating every half-year the sort of information which is now collected every five years by the Government in the Census of Manufactures, so that we shall have at all times recently collected statistics which will indicate the size and importance of our industry.

The desirability of there being available statistics which accurately reflect conditions in the rubber industry and the relation of that industry to the commerce of the country is very pronounced in connection with work such as that which will be undertaken by a special joint legislative committee, comprising several factors in the automotive industry, at the instance of the Tire Divisions of this Association, with the approval of the Executive Committee. The enactment of Federal and State legislation which in any way concerns the interest of our tire

Boots and shoes	26,823,689	31,468,843	17.32	9.75	8.76
Other products	24,045,782	31,867,887	32.53	9.88	7.85
Grand totals	306,113,652	322,606,605	5.39	100.00	100.00

It is being distributed, however, regardless of whether or not a response to Questionnaire No. 100 was made by your company, but it is to be understood that, beginning with the enclosed Questionnaire No. 101, a compilation of the statistics will be sent only to those companies who furnish the data called for.

A. L. VILES, General Manager.

QUESTIONNAIRE NO. 101.

NEW YORK, December 17, 1919.

To all manufacturers of rubber products and reclaimed rubber: In furtherance of the plan for collecting basic figures regarding the rubber industry, submitted to you by your directors on March 24, 1919, and approved by the membership through their favorable replies to the letter of that date, we are submitting

manufacturers is to be carefully watched, with a view to make it possible to keep abreast of developments of this kind, and in this connection the statistics which are to be secured by questionnaires, such as the enclosed, will doubtless be of inestimable value.

The traffic and transportation interests of our members is given a great deal of attention by the Traffic Committee of the Association which knows, from much experience in dealing with the Railroad Administration and the officers of the individual carriers prior to Federal control, that if the rubber industry, through this Association, is able to produce accurate and comprehensive data concerning the industry in support of or in opposition to contemplated railroad legislation with respect to rates, rules, classification, etc., the influence thus brought to bear through the presentation of facts and figures is a very valuable factor in the strengthening of the position of the rubber industry.

Arrangements have been completed whereby the Guaranty Trust Company of New York will serve as the statistical agent of The Rubber Association in collecting the data requested in The Rubber Association questionnaires. These questionnaires are to be returned to the Guaranty Trust Company of New York, which then consolidates the individual returns, and submits the total figures only to The Rubber Association, together with a list of the firm members who have cooperated in making the total figures possible. The total figures only will be published by the Rubber Association, and will be sent only to the firm members who have made returns for their companies.

The Guaranty Trust Company will use all possible caution to insure secrecy for the individual returns which it receives, and manufacturers can make these returns with entire confidence

that only total figures for the entire industry will be published and that no one except carefully selected employees of the Guaranty Trust Company will have access to the individual returns.

Your Board of Directors believes that if a little thought is given to this matter along the lines of the foregoing it will become apparent to you that the collection and compilation of the statistics asked for is very much to be desired and that we shall accordingly be favored with a prompt and complete response for your company.

A stamped envelope addressed to the Guaranty Trust Company, to whom the enclosed questionnaire is to be returned, is sent you herewith for your convenience.

A. L. VILES, General Manager.

INDUSTRIAL RELATIONS COMMITTEE.

NEW YORK, December 26, 1919.

To firm members:

It is believed by the Association's executives that nearly all manufacturers fully realize the unusual and radical changes that have taken place with respect to the relation of employer and employee, these changes being particularly emphasized by the conditions arising during the war.

The war period created a demand for many special products and increased greatly the need for staple articles of utility. For these reasons a premium was placed on the labor required for such unprecedented production.

The unusual demands for labor of all kinds which accompanied production requirements soon led to wage adjustments and many radical changes in working conditions to the extent that nearly all the pre-war standards of employment were completely overturned and employers and employees obtained the new viewpoint required under such changed conditions.

On account of these conditions there seemed to be a desire for a helpful medium in the Association through which discussion and exchange of ideas might be had regarding industrial relations.

At a meeting of the Executive Committee of the Association, held on September 26, considerable discussion was devoted to the desirability of appointing an Industrial Relations Committee, which resulted in President Sawyer's consenting to investigate the situation with a view to placing a definite proposal before the Executive Committee at a future meeting.

Mr. Sawyer was aided in his investigation by directors and superintendents of labor, also factory managers, serving as a temporary committee, representing all of the various rubber manufacturing districts or centers, and the information brought forth by this investigation indicated clearly that much benefit might result from the formation of an Industrial Relations Committee.

At the Executive Committee meeting of December 5, it was definitely decided to form an Industrial Relations Committee along lines similar to the Association's traffic organization and that the total membership of the committee should not exceed twenty-five, ten of which should constitute an Executive Relations Committee.

It was further decided that the committee should be appointed with full consideration for territorial representation. Consequently, there were selected four representatives from Akron, one from Trenton, one from Canada, three from New York and New England and one from the Middle West, as follows, to constitute an Executive Industrial Relations Committee.

AKRON.

J. W. Thomas, Firestone Tire & Rubber Co.
C. Jahant, General Tire & Rubber Co.
M. A. Flynn, The B. F. Goodrich Rubber Co.
William Stephens, The Goodyear Tire & Rubber Co.

TRENTON.

C. H. Oakley, Essex Rubber Co.

CANADA.

D. E. Beynon, Dunlop Tire & Rubber Goods Co., Ltd.

NEW YORK AND NEW ENGLAND.

H. T. Martin, The Fisk Rubber Co.
H. I. Baxter, Hood Rubber Co.
C. S. Ching, United States Rubber Co.

MIDDLE WEST.

Members of the Association in the middle western territory have been asked to select their representatives, but we have not yet received definite advices.

The Executive Committee of the Association decided that the Executive Industrial Relations Committee shall recommend the additional fifteen members who, with the ten executives, shall

make up a committee of twenty-five, and it is expected that the recommendations shall recognize the idea of territorial representation in the same manner as in the selection of the Executive Industrial Relations Committee.

It is expected that the Industrial Relations Committee shall first endeavor to analyze the methods now being used in the rubber industry with respect to fundamental relations between employer and employee, including the organization of factory personnel or employment departments, the selection and assignment of new employees, the medium of contact between employer and employee, factory working conditions, health, sanitation, welfare, training of foremen, and probably wages.

It is further expected that following the analysis and exchange of ideas respecting the fundamental conditions referred to in the foregoing, the committee shall convey to the membership information and recommendations embodying the best features of the various plans analyzed.

It is hoped that the work of this committee shall become a constructive and useful factor in association work, and also that all members shall assist the work by presenting through this office subjects or problems for analysis and discussion at the committee meetings.

A. L. VILES, General Manager.

INDUSTRIAL RELATIONS COMMITTEE MEETS.

NEW YORK, December 26, 1919.

To firm members:

The first regular meeting of the Executive Industrial Relations Committee was held at this office on December 12. The election of officers for the year 1920 was first given attention and the following members of the committee were unanimously elected to the respective positions: C. S. Ching, chairman; H. L. Baxter, 1st vice-chairman; C. H. Oakley, 2nd vice-chairman.

After the election of officers, the entire day was given to a discussion as to the information needed from firm member manufacturers respecting the present personnel or employment organizations, this discussion being predicated on the committee's conclusion that, undoubtedly, every employer in the rubber industry desires to make adequate provision for efficient supervision of the relation between employer and employee.

It was the further conclusion of the committee that the five fundamental features of the employment or industrial relation are as follows:

1. Employment.
2. Health.
3. Safety and sanitation.
4. Training of foremen.
5. General service.

In order that the committee may give consideration to the methods that may be productive of the greatest degree of efficiency, it desires to secure from each manufacturing firm member detail information respecting the organization now in existence at each plant for handling this work.

It is hoped that firm members will find it convenient to send the desired information to this office as early as possible in order that the committee may proceed with the work of analysis of the various methods employed. The committee wishes to emphasize that each firm member will ultimately receive the benefit of a comprehensive plan predicated on the best that can be drawn from individual methods and practices and the recommendations or plans submitted by the committee will be compiled in chart form in such manner as to be flexible and easily adapted to large or small organizations.

A. L. VILES, General Manager.

MEETING OF THE SCRAP RUBBER DIVISION.

At the meeting of the Scrap Rubber Division of the National Association of Waste Material Dealers held at the Hotel Astor, New York City, on December 9, the former chairman, Herman Muehlstein, was reelected to serve for the balance of the present fiscal year. In view of the limited attendance of scrap rubber members, no matters of importance were considered for the reason that it is planned to hold a meeting of that division early in January.

NEW YORK RUBBER EXCHANGE.

The delayed publication of this issue, due to the printers' strike, permits the announcement of the organization by the New York Rubber Trade Association, of a crude rubber exchange to serve as a market for dealing in futures along the lines of other market exchanges. The price of a seat is to be \$1,000.

The Obituary Record.

DEAN OF SHOE TRADE JOURNALISM.

GEORGE E. B. PUTNAM, dean of shoe and leather journalists of Boston, died of apoplexy at his home in Newton Centre early on the morning of December 11, 1919, aged 67 years.

For thirty-two years Mr. Putnam had been connected with the editorial staff of the "Boot and Shoe Recorder," four years as editor, and was affectionately known as the "encyclopedia" of the staff. He was an authority on footwear matters and the historian of the shoe trades. He was a very prolific writer, and veterans of the trade still quote his "shop tales" in early issues of the "Recorder," and recall the tone and timeliness of his news letters and market reports.

GEORGE E. B. PUTNAM.

Early in his editorial career he perfected his knowledge of merchandising by extensive travel in practically every State in the Union, and hundreds of footwear men may remember his pilgrimages of a quarter of a century ago. His trips to Central and South America, the West Indies, Canada and other sections of the Western Hemisphere to study foreign trade extension for the benefit of manufacturers of shoes and rubbers desiring export business, supplied the material for numerous illustrated travel lectures of interest and charm.

About nine years ago Mr. Putnam relinquished his editorship of the "Recorder," but continued as an associate editor, writing weekly "The Leather Market" and "The Rubber Realm," which had been popular features of the paper for many years. Turning to rubber research work some five years ago, he joined the editorial staff of *THE INDIA RUBBER WORLD*, and became its Boston correspondent, directory and biographical writer, and librarian, a position which he filled with rare faithfulness.

George Edwin Ballard Putnam, a descendant of the famous Putnams of Revolutionary days, was born in Boston, Massachusetts, December 29, 1851. He attended the Quincy School, and was graduated from the English High School in 1869, being awarded the Franklin Medal for distinguished scholarship. For a time he engaged in the directory business, but gradually drifted into amateur journalism and writing for the trade press. "The Youth's Companion," in the old days when Mr. Ford, its founder, was alive, numbered him on its editorial staff.

Mr. Putnam was a member of the Old Boston Schoolboys' Association, and at one time president of the English High School Class of 1869 Association. Being among the earliest amateur journalists, he became one of the founders of "The Fossils," a New York City club composed of former publishers of amateur papers throughout the country. He was a member of Dalhousie Lodge, A. F. and A. M., of Newtonville, Massachusetts, also of the Boston Shoe Trades Club, and had not missed a single meeting of the Boston Boot and Shoe Club until the session on the evening of December 10, only twelve hours previous to his death. Prominent in church work, he had for the past seven years officiated as a deacon of the First Baptist Church, Newton Centre, Massachusetts.

Every branch of the Boston footwear, rubber and leather trades, and the publications dealing with these industries, joined in honoring his memory at the funeral, which was held in the First Baptist Church at Newton Centre. In the gathering were

representatives of the Rubber Club of America, the Boston Boot and Shoe Club, the Boston Shoe Trades Club and the Dalhousie Lodge of Masons. Rev. Charles N. Arbuckle, pastor of the parish, conducted the service, and also read prayers at the family home at 16 Elmrose street, Newton Centre. The interment was in Forest Hills Cemetery.

The bearers were: Oscar Blaisdell, of the G. W. Armstrong News Co.; Charles H. Clark, Master of Dalhousie Lodge; Henry H. Kendall, a deacon of the Newton Centre Baptist Church; George W. R. Hill, vice-president of the "Boot and Shoe Recorder"; Arthur D. Anderson, editor of the "Boot and Shoe Recorder"; Harry Olsen, editor of the "Export Recorder"; James H. Stone, manager of the "Shoe Retailer," and Phil M. Riley, of the editorial staff of *THE INDIA RUBBER WORLD*.

One of those rare gentlemen of the old school, Mr. Putnam closed his Book of Life with that quiet calmness that had characterized his serene and happy, though withal very busy, life. He was a patriotic, clean American, lovable and widely loved. Thinking ill of no man, he embittered none and made a friend of everybody he met. No one ever heard a profane word from his lips. A familiar and a popular speaker at thousands of local and national rubber and shoe trade gatherings, he was "Colonel" Putnam or "G. E. B. P." in affectionate daily greetings. His faithfulness, fairness, integrity and ever ready spirit of helpfulness was an inspiration to his associates, who mourn his loss and by whom he will long be remembered.

He is survived by his widow, Ellen H. Putnam; a son, Russell B. Putnam, of Waterbury, Connecticut, and a daughter, Mrs. Harry B. Chesley, of East Sumner, Maine.

PROMINENT IN THE WIRE INDUSTRY.

William Ellis Rice, one of the pioneers in the New England wire industry, died December 12, 1919, at his home in Worcester, Massachusetts, aged nearly 87.

As a boy of 18 he entered the employ of Ichabod Washburn & Co., wire drawers and finishers. Seven years afterwards he took a partner and entered the business, first in Connecticut and later building a model plant, for that period, at Holyoke, Massachusetts. In 1865, at the solicitation of Ichabod Washburn, the business was joined with the Washburn & Moen Wire Works, afterwards the Washburn & Moen Manufacturing Co., Mr. Rice becoming a director and later an executive officer. He introduced in this country the continuous rod rolling system, and later was the first American to import Swedish iron. In 1891, as president of the Worcester Wire Co., and of the Washburn & Moen Manufacturing Co., he effected the sale of the two corporations to the American Steel & Wire Co., after which he retired from business.

Mr. Rice held membership in the Union Club of Boston, the Worcester Boys' Club, Worcester Society of Antiquity, Tatnuck Country Club, Worcester Art Museum, Worcester Art Society, Worcester Club, Worcester Continentals, Worcester Board of Trade and the Home Club of Worcester. He leaves his widow, one son, and one daughter.

R. E. WRIGHT, EUROPEAN MANAGER FOR THE I. B. KLEINERT Rubber Co., was taken suddenly ill in London in returning from a business trip on the Continent and died of a stroke in the latter part of November.

MRS. AUGUSTA NEIDNER, WHO DIED EARLY IN NOVEMBER IN MALDEN, MASSACHUSETTS, at the age of 85 years, was the widow of Charles H. Neidner, who came to this country from Saxony in

1863 and in 1893 established the linen fire hose business now carried on by his three sons, under the name of Chas. Neidner's Sons Co. Mr. Neidner died in 1908. Mrs. Neidner was also born in Saxony and came to this country with her husband 44 years ago. Three sons and two daughters survive her.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

(766.) A reader requests the addresses of manufacturers of wiring machines for applying baby-carriage tires.

(767.) An inquiry has been received for the address of manufacturers of tire wrapping tape, who might have seconds for sale.

(768.) A reader asks for the addresses of manufacturers of rebuilt tires, particularly of the "Popular" and "Leader" brands.

(769.) Request is made for the addresses of manufacturers of rosin spirit who will quote prices and send samples abroad.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

Addresses may be obtained from the Bureau of Foreign and Domestic Commerce, Washington, D. C., or from the following district or cooperative offices. Request for each address should be on a separate sheet, and state number.

DISTRICT OFFICES.

New York: 734 Customhouse.
Boston: 1801 Customhouse.
Chicago: 304 Federal Building.
St. Louis: 402 Third National Bank Building.
New Orleans: 1020 Hibernia Bank Building.
San Francisco: 307 Customhouse.
Seattle: 848 Henry Building.

COOPERATIVE OFFICES.

Cleveland: Chamber of Commerce.
Cincinnati: Chamber of Commerce.
General Freight Agent, Southern Railway, 96 Ingalls Building.
Los Angeles: Chamber of Commerce.
Philadelphia: Chamber of Commerce.
Portland, Oregon: Chamber of Commerce.
Dayton, Ohio: Dayton Chamber of Commerce.

(31,412.) Agency desired by a firm in the Netherlands for tires.

(31,427.) A firm in Persia desires to connect with manufacturers of overshoes and rubber goods. Asks that quotations be accompanied by catalogs and samples, and, if possible, freight rates to Bagdad. Payment 25 per cent when goods are shipped and balance through bank in Persia.

(31,434.) Representative of a firm in Mexico wishes agency from manufacturers for the sale of rubber tires.

(31,440.) A merchant in the Netherlands desires agencies for the sale of rubber goods, such as hose, sheeting, hospital cloth and gloves.

(31,441.) A man in France wishes an agency on a commission basis for the sale of rubber thread for elastic fabrics. Correspondence may be in English.

(31,444.) Commercial agent from Venezuela is in the United States to secure an agency for the sale of elastic material used for suspenders, garters, and notions.

(31,450.) A firm in Greece wishes an agency for the sale of rain coats.

(31,451.) A broker in Italy wishes an agency for the sale of tires, accessories and rubber goods. Correspondence may be in English.

(31,452.) A company in the Canary Islands desires an agency to sell rubber articles. Quotations, c. i. f. the Canaries via Liverpool. Terms 30 days sight up to 60 days, usually granted to purchasers. Correspondence must be in Spanish.

(31,470.) A firm in Belgium wishes an agency for the sale of accessories. Tires. Quotations should be c. i. f. Antwerp. Payment, cash. Correspondence and catalogs in French.

(31,499.) A business woman in Belgium, who knows the shoe trade, wants an agency for the sale of rubber overshoes and kindred articles. Quotations c. i. f. Antwerp. Correspondence and catalogs in French.

(31,501.) American firm of exporters wishes to establish in Poland and other European countries permanent agencies for the sale of rubber goods.

(31,503.) American exporters have established agencies in all the chief agencies of the Levant and wish to represent American firms for the sale of automobile accessories.

(31,505.) A manufacturing firm in Belgium wishes agencies for rubber and asbestos packings, India rubber goods and steam packing, especially black india rubber packing. Quotations c. i. f. Antwerp or Brussels. Payment, cash. Correspondence may be in English.

(31,511.) American export firm sending representative to England wishes agency for sale of rubber boots, overshoes, etc. Quotations requested.

(31,520.) Purchasing agent for British importing house wishes agency and to purchase automobile tires, for sale in Czechoslovakia, Holland, Spain and Italy. Quote f. o. b. New York.

(31,522.) A firm in Spain wishes to purchase rubber of all kinds for footballs. Correspondence should be in Spanish.

(31,528.) A man in Switzerland wishes agency for sale of tires. Correspondence in French or German.

(31,529.) Agent in the United States of a firm in Finland wishes to purchase rubber goods and belting. Quotations f. a. s. New York. Payment, letter of credit through bank in New York.

(31,532.) A commercial representative in France wants an agency to sell medical and surgical articles in ebomite and rubber. Quotations c. i. f. French port. Correspondence may be in English.

(31,561.) Purchasing agent of firms in France wishes to get in touch with manufacturers of rubber goods.

(31,566.) A firm in Portugal desires to secure an agency for automobile accessories, including tires. Correspondence in English.

(31,614.) Commercial agent in Bulgaria wishes to buy large quantities of rubber shoes. Correspondence may be in English.

(31,618.) Commercial agent in Belgium wishes to buy raincoats. Quotations c. i. f. Antwerp. Correspondence and catalogs in French.

CUSTOMS APPRAISER'S DECISIONS.

No. 38211.—Reappraisal 95726, etc., of Goodyear Tire and Rubber Company, (New York).

AUTOMOBILE TIRES.—Tires entered at Buffalo and Chicago by the Goodyear Tire & Rubber Co. of Canada were appraised for duty at the price charged to dealers. The company has three scales of prices for its tires, one for export and for manufacturers of automobiles, a second for sales to jobbers and a third for sales to dealers. G. A. McClelland held that although the company restricted the methods of selling, there was a wholesale price for the tires in Canada and appraisers were right in levying duty on basis of the price to dealers. (Treasury Decisions, Volume 37, No. 24.)

Protest 851,995-3263 overruled. No. 38207.—United States vs. National Gum & Mica Co. (No. 1991) United States Court of Customs Appeals. Appeal from Board of United States General Appraisers, Abstract 43,118.

GUM KARAYA.—Assessed at 10 per cent ad valorem under paragraph 385 of the tariff Act of 1913. Free entry claimed under paragraph 513 as crude rubber, or under paragraph 552 as a crude vegetable substance. Three other protests, but not this one, claimed free entry as a crude drug under paragraph 477. A board heard the four protests and granted the appeal on the ground that gum Karaya was a crude drug. The court, Martin, J., delivering the opinion, modifies the decision by excluding appellee from its effect, as he had not put in the crude gum plea. (Treasury Decisions, Volume 37, No. 23, November 25, 1919). (I. R. W., Oct. 1919, p. 10; Sept. 1919, p. 700.)

INTERESTING LETTERS FROM OUR READERS. MAKES THE TIRE PERFECT?

TO THE EDITOR:

DEAR SIR:—The perfect tire is here, at least I think so. That is a rather bold statement to make, but in view of the facts, the writer feels safe in such affirmation.

THE SECURITY NO-AIR TUBE

CROSS SECTION.

ARRANGEMENT
OF SUCTION CUPS.

TUBE IN PLACE.

With the tire tube shown in the illustration a blow-out is an impossibility for the reason that there is no air in the tube to blow out. Also the construction is perfect. It mechanically embodies the basic principles of the pneumatic tube and eliminates the objectionable features of the ordinary air tube.

This tube contains seventy-five per cent pure rubber, coupled with the usual admixture of chemicals. The outside of the tube is recessed by 30 to 40 suction cups which take up and distribute the shock received in running. Anyone who has played basketball knows that the suction cups in the soles of his shoes enable him to come to a quick stop by sticking to the floor. In the same manner do these suction cups cling to the tire casing so that there is no such thing as creeping as often happens with an under-inflated air tire.

I have sharp ears, and I can hear my readers say "Why, that tube is almost solid with the casing forms a solid tire." True in part, but this tube through its center channel and suction cups offers room for expansion. It is, of course, much heavier than the pneumatic tire. This weight, however, is an asset rather than a liability for various reasons. It is a well-known fact that a car using air tires is to a degree top-heavy. This fact would mean nothing whatever if all the roads in the world were level and smooth, but the motorist knows how rough roads really are. For instance, let us suppose that you are trying to take a rough hill on high. The speed of the car together with the top-heaviness will cause the rear wheels to leave the ground when they hit a rough spot. Every time the wheels leave the ground there is lost power and lost motion, which in turn means abuse of the engine and the tire casings, and invariably the driver has to shift gears to reach the top of the hill. With this heavier tire, the top-heaviness is eliminated, the car is equally balanced, it runs much more smoothly and consequently does not leave the ground on the least provocation. Incidentally that hill can be taken on high.

Tests made personally by the Detroit representative of the firm manufacturing these tires, and extending over a period of two years show a total mileage during that period of thirty-six thousand miles on a single set of tubes. In fact, this test is still going on, for he is using the tubes every day. In the latter part of 1918, he replaced the original set of casings because they were so badly worn that the tubes were visible in half a dozen places—not only visible, but actually riding the pavements. This was after a total run of twenty-four thousand miles.

Another test made by the Detroit Police Department proves quite interesting. In February, 1919, permission was obtained from Captain Kling, then a lieutenant on the Detroit police force, to install a set of tubes on the "minute car" of the department. This car is a general utility Ford touring car which is on the go twenty-four hours a day, and is operated by three shifts of drivers. The tires were installed during an overhaul period and

none of the drivers knew of the installation. Three months had gone by before the drivers knew they were using other than pneumatic tubes, as each thought the other fellow was looking after the tires. These three drivers swear by the tubes and claim that the car is giving better service than ever before.

MAURICE S. CLEMENT.

Detroit, Michigan.

THE EDITOR'S BOOK TABLE.

"A RUBBER PLANT SURVEY OF WESTERN NORTH AMERICA." By Harvey Monroe Hall and Thomas Harper Goodspeed. University of California Press, Berkeley, California, 1919. (Paper, 7 x 10 1/2 inches, 121 pages.)

IN THIS BOOK THE AUTHORS HAVE REPORTED the results of an extensive survey of the Great Basin region for rubber-producing plants, begun in 1917 as a war-emergency measure.

During 1918 this broadened into a comprehensive search throughout the West for all species known or suspected to contain rubber. The work is to be continued to determine all the possibilities of rubber production in the West. Rubber was found in 25 of the species examined, although in only four was it high enough to warrant the hope for its recovery on a commercial scale.

NEW TRADE PUBLICATIONS.

THE GILLETTE RUBBER CO., EAU CLAIRE, WISCONSIN, ISSUE AN illustrated catalog of rubber machinery and equipment in a handsome loose-leaf binder. On the covers are views of the exterior and interior of the company's buildings. The catalog contains cuts and descriptions of a mixing mill, inner tube splicing press, wrapping lathe, valve nut tightener, tire stripping stand, bead making machine, tire building stand with foot pedal, core puller; tire-buffing machine and stock racks.

THE LINK-BELT CO., CHICAGO, ILLINOIS, HAS RECENTLY ISSUED two handsome illustrated books devoted to its modern labor-saving equipment. Book No. 375 is a profusely illustrated brochure of 108 pages showing the application of link-belt elevators, conveyors, and other freight and package handling machinery to many varied industries. Among these applications is included an elevator for conveying tire bands, and a conveyor used in assembling electric storage batteries. Book No. 380, of 100 pages, depicts in a similar manner the manifold uses of link-belt hoists and overhead cranes.

THE BULLETIN OF THE CHAMBER OF COMMERCE OF THE UNITED STATES OF AMERICA in the Argentine Republic, Volume 1, No. 1, dated August 20, 1919, and two succeeding issues have come to hand. This readable and attractive new publication is devoted to the foreign trade of the United States with particular reference to the Argentine Republic, and will endeavor to give American exporters accurate and helpful information and suggestion for the betterment of commercial relations between the two countries. The rubber and allied industries are identified with the chamber, as seen by consulting the list of officers and members. Among the former may be mentioned the treasurer, Noel F. Tribe, of The First National Bank of Boston, and one of the governors, J. A. Wheatley, of the Ault & Wiborg Co., Cincinnati, Ohio. The 123 active members include the Corn Products Refining Co., Goodyear Tire & Rubber Co. of South America, United States Rubber Export Co., Limited, The First National Bank of Boston, Sucursal Buenos Aires, Westinghouse Electric Export Co., Brunswick-Balke-Collender Co. of New York, Robbins & Myers Co., and the Firestone Tire & Rubber Co.

THE NEDERLANDSCHE GUTTA-PERCHA MAATSCHAPPIJ, THE Hague, Holland, owning factories at Singapore and plantations in the East, is increasing its issued capital to Fl. 1,675,000 (\$673,350) by the offer of 250,000 ordinary "A" shares at 200 per cent.

The Question of Tire Guaranties and Adjustments.

FROM THE OUTSET of tire manufacture tire guaranties have been burning questions, and so they still continue. If a tire does not give the guaranteed mileage or better the consumer asserts that the product is faulty, while the manufacturer maintains that it has been abused in use. Each claims that the other is at fault and should stand the loss. To an unprejudiced third party who does not know the facts it seems that both sides make out a good case. What then is the truth of the matter; what has brought such a situation about; how are such differences of opinion possible, and is there a remedy?

During the early years of bicycling, and when the automobile was young, rubber manufacturers knew little about building tires, and had no machinery or other facilities for turning them out in large quantities. But the bicycle and the automobile caught the popular fancy and supplied a genuine economic need. The more serious problems which had previously hampered their development were eliminated by the use of rubber tires and so rapid was the increasing demand and so insistent did it become that rubber companies were forced to experiment and develop their product and methods of manufacture as they went along, with the result that tires have been an ever-changing product in constant process of evolution.

Some firms succeeded much better than others and by secret and patented processes turned out higher grade tires than their competitors. Seeking to maintain the prestige thus won, and to protect the public against inferior goods, they established guaranties at first based on time and later on mileage.

Although originally instituted with the best intentions, these guaranties soon became the bane of the tire trade and brought about the worst forms of cut-throat competition. There was no uniformity about them, and some firms made the mistake of offering more lavish guaranties in order to get big orders when an attempt to discount the prices of their competitors failed. So reckless did they become that many concerns conducted business at a loss and would gladly have given up half of it to be rid of the guaranty nuisance.

For several years it seemed impossible to get the manufacturers together on a common ground to remedy the evil. In 1896, however, twenty-one leading tire manufacturers were licensed under the Tillinghast patents owned by Colonel Theodore A. Dodge. This and the fact that he was less actively engaged in competition than other tire men gave him a more independent position in the trade. Under his leadership The Rubber Tire Association was organized and a standard form of guaranty was adopted.

Under this guaranty tires showing defective material or workmanship were replaced and all practicable repairs were made free of charge no matter how the injury had been caused, provided the tires were delivered to the manufacturer express prepaid and further that anti-leak preparation had been used. Thus

pneumatic tires were at first guaranteed against punctures.

So liberal a guaranty, it was believed, would deter any manufacturer from using poor materials or allowing imperfect workmanship, for it seemed that nobody could afford to offer this guaranty on any but a good tire. And such would probably have been the case had it not been for the loose manner in which the guaranties were made good under the stimulus of keen competition. Whoever needed new tires could usually get them gratis from the manufacturer. This injured retail trade. Moreover, so long as new tires could be had without paying for them, neither

the price nor the quality mattered. Prices had to be unnecessarily high in order to cover these inordinate losses, and even then many manufacturers did not break even on their tire business.

Later the guaranty was limited to defective material and workmanship, and cutting of the rim, but punctures were still repaired free. Year by year the terms were still narrowed and the time limit was also shortened. There were guaranties for a year, then for a season, and in 1897 manufacturers began to charge for all repairs.

Several years ago all tire guaranties were placed on a mileage basis, and year

by year with better materials and improved methods of manufacture these guaranteed mileages have increased from 1,500 miles at the outset to 5,000 or 6,000 miles for fabric tires and 8,000 to 10,000 miles for cord tires to-day. At first the public manifested some tendency to buy cheap tires, but soon began to learn that the best is the cheapest. The change therefore improved matters considerably, yet it was still possible to get a new tire by claiming defective material or workmanship and paying a small percentage of the full purchase price based on the service mileage obtained from the alleged defective tire. Never has there been a greater temptation toward prevarication than has been offered by tire mileage guaranties, and the resulting situation is well shown in King's cartoon in the "Buffalo Express" of August 12, 1919.

Thus while tires generally have improved enormously in quality in recent years, they have been bought by the public not alone on their merit, but to a considerable degree on the liberality of adjustments made by certain companies. Guaranty conditions have been widely violated; the adjustment privilege has been greatly abused, and millions of tires have been sold annually at only a fraction of the full list price. Such a practice of putting a premium on the tricks of motorists and cyclists to replace their damaged and worn-out tires at another's expense has been manifestly unfair to manufacturers and honest consumers, and has kept prices unnecessarily high.

Manufacturers have by no means been ignorant of these abuses, but until recently the peculiar conditions of the trade have been such that neither could these abuses be checked nor the guaranty conditions adequately enforced in making adjustments. Leading makes of tires are now giving such excellent service, however,

THE DEBATEABLE GROUND OF TIRE MILEAGE GUARANTIES.

that under reduced prices and the increased mileage guaranties and unlimited guaranties covering materials and workmanship during the entire life of the tire which have recently been inaugurated, a marked stiffening up on adjustments has been possible. Honest users are satisfied with this fair treatment, while the avaricious tire users still make unfair claims.

The real trouble is that tire users have from the outset been allowed to expect so much that many have come to believe that to neglect or abuse their tires and have the manufacturer stand the expense is their inalienable right. If such persons will patronize only reputable concerns they will seldom find cause for just complaint. Tire companies of good standing have a reputation to maintain, both for quality of output and fair dealing, and are eager to maintain it. With them tire manufacture has become an exact science. So carefully are materials bought, so rigid is the inspection of materials and workmanship, so greatly improved are the processes of tire building, that a defective tire rarely reaches the consumer. When it does, the defect is obvious to an expert and will be gladly adjusted to the satisfaction of the user. Practical experience has now been sufficient, however, to show exactly how a tire of any given make, type and construction will wear under all conditions, and prevarication is of little avail with an expert adjuster.

The relative merits of the mileage and unlimited guaranty have been much discussed. Both have certain advantages, yet the adjustments now being made under both systems are substantially the same. For many years THE INDIA RUBBER WORLD has asserted that any sort of tire guaranty, aside from the im-

plied assurance that every reputable manufacturer will stand behind his products, is guaranteeing the unguaranteeable, and it still believes that tire guaranties will eventually be abandoned by the trade because from the very character of the service a tire is called upon to perform the duration of that service cannot be foretold.

It is logical enough to guarantee a watch or a clock because one can predict its normal use and treatment. The same is true of a piano or a phonograph, for example. But a tire has no normal career, and calls for a guaranty no more than a suit of clothes or a pair of shoes. When it leaves the factory a dozen different futures may be open to it, involving good or bad roads, careful usage or abuse, proper repair or neglect through ignorance or indifference. It may leave the factory good for 10,000 miles of careful usage, yet everything considered, it is humanly impossible to guarantee half or even one-quarter of that distance. Would it not, therefore, be better for manufacturers to make the best tires possible, and without other than an implied guaranty advertise, for example, that they are averaging 6,000 miles? It would be a welcome relief to the manufacturers, and they could afford to give the consumer still lower prices. It would tend to make the user more careful of his tires, and would make strongly for general veracity and better feeling. There is always the argument that should one firm adopt such a course it would be playing into the hands of competitors who continue their guaranties, but the time will probably come when most leading firms can agree on such a policy and put it over without loss to anybody.

Dunlop Rubber Co. Plans to Enter American Tire Market.

AT AN EXTRAORDINARY MEETING of the Dunlop Rubber Co., Limited, held in London on December 2, 1919, the new chairman, A. I. Ormrod, explained to the shareholders the plan for increasing the capital of the company, which was

The holders of preferred stock were to have no special rights to the new issue. It was this exclusion of the preferred stockholders that aroused criticism, and that seems to have led the London Stock Exchange to hold up the issue of the new stock

OF THE ENGLISH DUNLOP AT BIRMINGHAM, ENGLAND. BIRD'S EYE VIEW OF THE NEW MILLS (42 ACRES OF BUILDINGS)

made public at the close of November and caused some unfavorable criticism.

The proposed plan was to increase the capital to £7,500,000 by creating 1,000,000 additional ordinary shares of £1 each, which should be equal to the existing ordinary shares, except that they would draw no dividend that might be declared for the financial year that ended on August 31. The intention was to offer the new shares first to the present holders of ordinary shares on a basis of two new shares for every three old ones; to set aside twenty thousand shares for employees, and if any were left over, to turn them over to the guarantor of the new issue.

until its requirements are satisfied. No objection seems to be taken to Mr. Ormrod's declaration that a part of the new capital is to be used in a campaign for the American market.

It may be recalled that in 1917, when the Dunlop company made its large increase in capital that brought the amount up to £6,000,000, there were rumors that led the chairman of that day to deny there was any intention of competing in the American market, and to publish the statement that "There is nothing to support the idea that tire makers of Great Britain are combining to fight new foreign competition." Mr. Ormrod, now, after explaining that £1,600,000 of the amount raised is to be

spent on the work at Fort Dunlop, another £1,000,000 in France, and large sums for other needs toward the company's development, states that £1,000,000 are to be employed in America to start, among other things, a rubber plant that shall be the counterpart of Fort Dunlop, with improvements, and that the sum is a mere beginning, because the officials of the Dunlop company are in touch with a leading American banking house regarding the raising of the additional £6,000,000, which will be needed to fully carry out the scheme.

He explained that in 1916, the rights of manufacturing and trading in the United States were bought back from the American Dunlop Co.; that a committee of experts sent to the United States this year reported that it is a good time for the extension there of the Dunlop business; that he himself examined conditions in America during the war, although he was not then connected with the Dunlop company. He said, also, that a Dunlop American Trust, Limited, had been formed for the purpose of forming a company in the United States to be called "Dunlop America Limited," or some such title. The plan is for the Dunlop Rubber Co. to take at par 1,000,000 ordinary shares in the American company, one-fourth of the ordinary shares; it will receive also for its trouble 10 per cent of the cost of erecting and equipping a rubber plant, and a royalty on the American net profits. The Dunlop Rubber Co. will also have a right to name a majority of the directors, and if any further increase of the ordinary stock is made by the American company, it must provide that the British company may buy one-fourth of the new stock at par.

The stockholders present applauded the speech and seemed to find no objection to this carefully thought out plan for invading the American rubber market. Mr. Ormrod expatiated on the probable large profits and declared: "American times will come, anyway—they had better be Dunlop-American."

Since the above announcement was made, there have been incorporated in the United States two new companies under the laws of New York, namely, Dunlop America Limited, and Dunlop Wheel & Rim Co., Inc., details concerning which appear elsewhere in this issue.

Steps are being taken already to have the Canadian company, The Dunlop Tire & Rubber Goods Co., Limited, of Toronto, cooperate in the new plan. The sum of \$1,500,000 has been appropriated for erecting a new factory in Toronto. The building, fronting on three streets—Queen, Booth and Natalie—is well under way and is being rushed to completion; it is 400 feet by 80 feet, four stories high above the basement. It will be devoted especially to the manufacture of the Dunlop cord tires, "Traction" and "Ribbed."

BRIEF HISTORICAL REVIEW OF THE DUNLOP COMPANY.

The Dunlop companies have played so important a part in the development of rubber tires that a brief review of their history may be interesting. The invention by Dr. John B. Dunlop of a pneumatic tire for his little boy's bicycle in 1888 was taken up by the late Harvey du Cros at the moment when the bicycle craze was taking hold of England, and the Pneumatic Tyre Co., Limited, was started in Dublin with a capital of £15,000 in 1889. The company was pushed energetically and by 1893, subsidiary companies were started in the United States and in France. In 1896 came the great boom in which Ernest Terah Hooley took a hand and won his notoriety. The Dunlop Pneumatic Tyre Co. was capitalized at £5,000,000, and the pneumatic tire business was so good that Mr. du Cros was able to pull the company through after Hooley's collapse. It is interesting to note that THE INDIA RUBBER WORLD at that time, while warning against the excessive enthusiasm for bicycles, remarked, "The horseless carriage is also coming in for a share of attention, and the makers of tires are hoping for a new field for their industry in equipping these vehicles with rubber."

The American Dunlop Tire Co. lasted till 1901. The *Société Française des Pneumatiques Dunlop*, after the French courts had decided that the Dunlop patents were invalid, was sold to the British company in 1909. In 1899 two other important subsidiary companies were formed—the Dunlop Tire Co. of Canada, Limited (now the Dunlop Tire & Rubber Goods Co., Limited), with £1,000,000 capital, and the Dunlop Pneumatic Tyre Co. of Australasia, Limited, with £120,000. There was also established a Dunlop Pneumatic Tyre Co. (Continental), Limited, in London, which was to acquire the Dunlop branches in Italy, Denmark, Belgium, Holland and Russia. Later a Dunlop Pneumatic Tyre Co., G. m. b. H., was established at Hanau in Germany (1904), and a Dunlop Rubber Co. (Far East), Limited, at Singapore (1909), and near Kobe, in Japan (1910).

As is well known, the Dunlop patent proved of no avail, as Thomson had patented practically the same tire in 1844, and had applied it to carriages. Mr. du Cros, however, soon acquired other important patents, notably the Welsh and the "Clincher," some of them American, and was able to keep the lead in the industry which he had started. In 1904, by which time it was clear that the bicycle trade was declining, he had turned his attention to the possibilities of the fast developing motor trade; the company's capital was then £4,000,000.

After the Dunlop Pneumatic Tyre Co. had become a subsidiary of the Dunlop Rubber Co., the present organization, its capital was reduced. In 1917 there was much activity in the rubber company. The capital stock was increased to £6,000,000, by creating £3,000,000 of 7 per cent preference shares, which were in addition to £1,000,000 of 6½ per cent preference shares created the year before. Moreover, there were rumors that brought out the statement that the increase was not intended "To support the idea that the tire makers of Great Britain are combining to fight new foreign competition." Later there was uneasiness because a firm of brokers was believed to have bought £4,000,000 ordinary shares of Dunlop for financial interests that were not in harmony with the persons who controlled the company.

It should be noted that the additional £1,000,000 shares to be offered now are expected to bring in, not their par value, but £8,000,000.

In 1913 the works at Fort Dunlop were begun. This is a plot of land containing 250 acres, about five miles from Birmingham, close to the canal and the railway. The buildings already put up on this ground cover more than 27½ acres and will soon cover more than 40 acres. In 1914 the company began to build its own cotton mills, and at present the Dunlop company's cotton mills are valued at £3,000,000.

BONUSES FOR SALARIED RUBBER EMPLOYEES.

As a holiday remembrance the United States Rubber Co., New York City, gave to its salaried officers and employees in this country, including subsidiary companies, a bonus of 10 per cent of their salaries, if not exceeding \$2,000 annually. All those receiving higher salaries were given \$200. About 7,500 persons were benefited by this Christmas gift.

The B. F. Goodrich Rubber Co., announces that 25 per cent of their annual pay will be given to all salaried employees this year. Approximately \$2,500,000 will thus be distributed to about 7,500 employees.

THE MASON TIRE & RUBBER CO., KENT, OHIO, ANNOUNCES AN unlimited mileage guarantee stating that no matter how far a Mason tire has run, if it should develop any defect in material or workmanship, it will be adjusted fairly on the basis of the service it would have given had the defect not existed.

AT AN EXHIBITION HELD FOR FOUR DAYS DURING THE MONTH of August at Tjandoer, Java, the *Naamloose Vermaatschap Rubber en Handel Maatschappij Tjandoer* of Pasir Hajam had an exceptionally fine display of inland crude rubber samples,

News of the American Rubber Trade.

DIVIDENDS.

THE AMERICAN CHICLE CO., NEW YORK CITY, has declared its quarterly dividend of one and one-half per cent, payable January 2, 1920, on preferred stock of record December 20, 1919.

Ames Holden McCready, Limited, Montreal, Quebec, has declared its quarterly dividend of one and three-quarters per cent, payable January 2, 1920, on preferred stock of record December 19, 1919.

The American Zinc, Lead & Smelting Co., St. Louis, Missouri, and Boston, Massachusetts, has declared its quarterly dividend of \$1 per share, payable February 2 on preferred stock of record January 23, 1920.

The Apsley Rubber Co., Hudson, Massachusetts, has declared its semi-annual dividend of three and one-half per cent, payable January 1, 1920, on preferred stock of record December 31, 1919.

The Brunswick-Balke-Collender Co., Chicago, Illinois, has declared its quarterly dividend of one and three-quarters per cent, payable January 1, 1920, on preferred stock of record December 20, 1919.

The Canadian Westinghouse Co., Limited, Hamilton, Ontario, has declared a quarterly dividend of one and three-quarters per cent and an extra dividend of one per cent, both payable January 1, 1920, on stock of record December 19, 1919.

The Corn Products Refining Co., New York City, has declared an initial regular quarterly dividend of one per cent and an extra dividend of one-half of one per cent on common stock; also, a regular quarterly dividend of one and three-quarters per cent on preferred stock; all payable January 20 on stock of record January 5, 1920.

The Driver-Harris Co., Harrison, New Jersey, has declared quarterly dividends of two per cent on common stock, and of one and three-quarters per cent on preferred stock, both payable January 2, 1920, on stock of record December 22, 1919.

E. I. du Pont de Nemours & Co. (incorporated), Wilmington, Delaware, has declared a quarterly dividend of one and one-half per cent on debenture stock of record January 10, payable January 26, 1920.

The Firestone Tire & Rubber Co., Akron, Ohio, has declared the following dividends: two per cent special, payable December 20 on stock of record December 15, 1919; one and one-half per cent quarterly, payable January 15 on six per cent preferred stock of record January 1, 1920; and one and three-quarters per cent quarterly, payable February 15 on seven per cent preferred stock of record February 5, 1920.

The First National Bank, Boston, Massachusetts, has declared the following dividends: quarterly, at five and four per cent on stock of record December 31 and December 24, 1919, respectively, both payable in January, 1920; extra, one per cent, payable January 2, 1920, on stock of record December 24, 1919.

The General Tire & Rubber Co., Akron, Ohio, has declared quarterly dividends of one and three-quarters per cent, payable January 2, 1920, on common and preferred stock, respectively, of record December 20, 1919.

The B. F. Goodrich Co., Akron, Ohio, has declared a quarterly dividend of \$1 per share, payable February 16 on stock of record February 5, 1920.

The Hodgman Rubber Co., Tuckahoe, New York, has declared a dividend of \$1.13 on preferred stock of record January 15, payable February 1, 1920.

The Keystone Tire & Rubber Co., Inc., New York City, has declared a quarterly dividend of three per cent on stock of record December 15, 1919, payable January 2, 1920.

The McLean Tire & Rubber Co., East Liverpool, Ohio, has declared dividends of four and one-half and three and one-half per cent, respectively, on common and preferred stock, payable December 30 on stock of record December 20, 1919.

The Madison Tire & Rubber Co., Buffalo, New York, has declared its initial quarterly dividend of two per cent, payable January 2, 1920, on preferred stock of record December 24, 1919.

The Mt. Vernon-Woodbury Mills, Inc., Baltimore, Maryland, has declared its semi-annual dividend of three and one-half per cent on preferred stock of record December 21, 1919, payable January 15, 1920.

The National Aniline & Chemical Co., New York City, has declared its quarterly dividend of one and three-quarters per cent on preferred stock of record December 15, 1919, payable January 1, 1920.

The Portage Rubber Co., Akron, Ohio, has declared its quarterly dividend of one and three-quarters per cent on preferred stock of record December 20, 1919, payable January 1, 1920.

The Tropical Tire & Rubber Co., 51 Leonard street, New York City, has declared its semi-annual dividend of four per cent on Class A stock of record December 10, 1919, payable January 2, 1920.

The United Shoe Machinery Corp., Boston, Massachusetts, has declared the following dividends: one and one-half per cent on preferred stock and fifty cents per share on common stock, both payable January 5, 1920, on stock of record December 16, 1919.

The Westinghouse & Electric Manufacturing Co., East Pittsburgh, Pennsylvania, has declared the following quarterly dividends: two per cent on common stock of record January 2, payable January 31; one per cent on preferred stock of record January 2, payable January 15, 1920.

The Winsboro Mills, Winsboro, South Carolina, have declared a quarterly dividend of one and three-quarters per cent on preferred stock of record December 24, payable January 1, 1920.

FINANCIAL NOTES.

The Boston Belting Co. has asked permission to increase its authorized capital stock from 10,000 to 15,300 shares. The new capital will consist of 10,300 preferred shares of \$50 par, and 5,000 common shares of \$100 par. Preferred dividends will be cumulative at 7 per cent.

Thomas Clements, comptroller of the Firestone Tire & Rubber Co., has announced the purpose of the Firestone company to build a million-dollar plant in Singapore for the preparation of crude rubber for manufacture into tires.

The business of the Firestone Tire & Rubber Co. for the year ended October 31, totaled \$91,078,513, an increase of 20 per cent over that of the previous year. The company is behind on its orders and there is every reason to expect continued growth and prosperity during 1920.

Common no-par stock of the Victor Rubber Co., Springfield, Ohio, recently offered to the public in Cleveland, was rapidly taken at \$35 per share. Of the 50,000 shares of this stock authorized to be issued, only 35,000 are at present being offered.

It will be noted in the following statement that the Perfection Tire & Rubber Co. has no bonded mortgage or preferred stock indebtedness and that the fixed and liquid assets have shown an increase in the first five months of this year of \$1,522,512.62. Regarding income, profit and loss for the first five months of this year, a comparison of the figures shows very substantial

Reed, J. E. & Mize, Inc., 1000 E. Delaware street, capital, \$50,000 shares without nominal or par value. T. L. Croton, P. B. Drew, H. E. Keen, all of Wilmington, Delaware, all of which are in production. Trust Co. of America, Du Pont Building, Wilmington, Delaware. To manufacture and deal in tires and tubes.

Salvage Tire Co., Inc., October 14 (New York), \$100,000. G. T. Fish, B. H. Engele, W. W. Sutton, Jr., all of 15 Broad street, New York City. To manufacture and rebuild tires.

Schlessel Safety Tire Protector Co., Inc., December 16 (New York), \$500,000. L. Schlessel, 640 McDonald street; R. Kestler, 174 South Ninth street, both of Brooklyn; R. Oellers, 828 West End avenue, New York City—all in New York. To manufacture tires, protectors.

Stoddard Tire & Rubber Corp., December 10 (New York), \$500,000. C. H. Stoddard, Navy Yard, Brooklyn; J. A. Sands, E. D. Yates, both of 150 Nassau street, New York City all in New York. To manufacture tires, etc.

Stonewall Tire & Rubber Manufacturing Co., December 15 (Indiana), \$250,000. S. J. J. Winton, 1025 N. E. 10th, Ellettsville, Indiana, \$250,000. H. Haase—all of Evansville, Ind. Principal office, Evansville, Indiana. To manufacture rubber tires and other rubber goods.

Stuart Machine Tire Co., Inc., December 24 (Oregon), \$500,000. C. A. Stuart, president; M. P. Chapman, vice-president; E. J. Noble, secretary; T. P. Randall, treasurer; R. J. Statts, manager. Principal office, Oregon City, Oregon. To manufacture and sell a puncture proof liner and tire for pneumatic automobile tires.

Trent Rubber Co., September 29 (New Jersey), \$500,000. H. A. Ludeke, I. A. Worthington, both of Trenton; K. Keller, Hoboken—all in New Jersey. Principal office, 26 West State street, Trenton, New Jersey. Agent in charge, M. G. Buchanan. To manufacture, purchase and sell tires, tubes, etc. (Formerly The Atlas Tire & Rubber Co.).

United States Furniture-Proof Co., November 22 (Delaware), \$500,000. W. F. O'Keefe, G. G. Steigler, J. H. Dowdell—all of Wilmington, Delaware. To manufacture inner tubes, castings, etc.

Wildman Rubber Co., Inc., September 8 (Delaware), \$100,000. W. W. Wildman, 160 Calvert avenue; J. C. MacGregor, both of Detroit; H. P. Orr, Lansing—all in Michigan. Delaware agent, Corporation Trust Co. of America, Du Pont Building, Wilmington, Delaware. To manufacture and sell all kinds of automobile tires, tubes and other rubber goods.

World Rubber Products Co., November 24 (Delaware), \$1,500,000. M. L. Harty, M. C. Kelly, S. L. Mackey—all of Wilmington, Delaware. Delaware agent, Delaware Charter Guarantee & Trust Co., Du Pont Building, Wilmington, Delaware. To manufacture rubber goods, etc.

Y. S. Sion Mechanical Tubeless Tire Co., Inc., December 26 (New York), \$100,000. A. Abramson, B. Perlman, both of 299 Broadway; H. Y. Skin, 55 Barclay street—all in New York City. To manufacture tires, etc.

HIGHEST PRICES PAID TO RUBBER WORKERS.

Men who work in rubber factories earned the highest average wages per hour and per week in the United States in 1919 and receive the highest percentage of increase since the war began; the women rubber workers, who are less favored, receive the second highest weekly wages in the eight industries examined by the National Industrial Conference Board in its "War-time Changes in Wages."

In September, 1914, the male workers in rubber factories were receiving 28.8 cents an hour and \$14 a week; the boot and shoe men did better, both by the hour and week; and the metal workers received a shade more an hour. In September, 1918, the rubber workers received 57.5 cents an hour and \$28.60 a week and in March, 1919, 61.2 cents an hour, the highest hourly earnings in any of the industries, and \$29.35 cents a week, far ahead of all other workers. The figures in the same period for the men cotton workers, who receive the lowest wages, were 18.9 cents per hour and \$10 per week in September, 1914; 38.5 cents and \$20.60 a week in September, 1918, and 38.9 cents an hour and \$17.10 a week in March, 1919.

The rubber men received 100 per cent increase in 1918 and 112 per cent in 1919 over 1914 in the hourly rate of pay, but 104 per cent increase in 1918 and 110 per cent in 1919 in weekly wages over 1914. The percentages of increase per hour for the cotton men was 104 in 1918 and 106 in 1919 over 1914, but it left them still lowest in the scale; while the percentage of increase per week, which was 106 in 1918 dropped to 71 in 1919. The chemical workers in the same time rose from 23.2 cents an hour in 1914 to 44.5 cents in 1918 and 49 cents in 1919; their weekly wages increased from \$12.85 in 1914 to \$26.80 in 1918, dropping to \$26.20 in 1919.

Women workers in rubber in 1914 received 17.4 cents an hour; this became 24.7 cents in 1918 and 29.2 cents in 1919, leaving them the worst paid per hour in any of the eight industries examined and with the lowest percentage of increase. Their weekly wages of \$9.25 were the highest paid to women in 1914; the increase to \$12.94 in 1918 left them at the bottom of the list, while the further increase to \$14.90 in 1919 makes them second only to the silk workers. In the same time the women cotton workers, earning 15.2 cents an hour in 1914, rose to 30.4 cents in Sep-

tember, 1918, and to 31.2 cents in March, 1919; their average weekly earnings of \$7.70 in 1914 became \$15.37 in 1918 and sank to \$12.75 in 1919.

The percentage increases in earnings of piece workers were greater than those of time workers and the actual earnings were also greater in many cases.

VICE-PRESIDENT OF ARTHUR W. STEDMAN, INC.

ARTHUR W. STEDMAN, JR., mining engineer and crude rubber broker, was born February 15, 1894, in Brookline, Massachusetts, which town was founded by his ancestor in 1705. First attending Volkman's School for Boys, he later entered the Groton School, where he prepared for Harvard College.

A. W. STEDMAN, JR.

His mind being centered on making mining engineering his life's work, he decided upon a course at the Colorado School of Mines, where he passed three years, and was in his last term when the World War was declared.

He served with the Colorado Corps of Engineers during the summer of 1916, took examinations for the Regular Army that fall, and was commissioned a second lieutenant. After further training at Camp Leavenworth he became first lieutenant. He was later transferred to Fort Oglethorpe where he served until January, 1918, when he received an honorable discharge for illness. After recovery, two months later he enlisted in the Tank Corps, soon becoming sergeant and accompanying the corps to France, where he served until June, 1919.

After pursuing the engineering profession for a time he entered the crude rubber business, and was made vice-president of the well-known firm of Arthur W. Stedman, Inc., 68 Broad street, New York City, of which his father is president.

PERSONAL MENTION.

R. W. Ashcroft has resigned as advertising manager, effective December 31, 1919, of the United States Rubber Co. He states that his future business plans have not been decided upon.

H. Tyler Kay, who has been engaged in advertising work during the last seven years with the Milwaukee "Journal," and with the Nemours Trading Corp., New York, and who was discharged from the army a short time ago, has been made advertising manager of The Madison Tire & Rubber Co., Inc., New York City.

George H. Jacobs, Akron manager for L. H. Butcher Co., Inc., was in New York City last month on a combined business and pleasure trip.

I. E. Baker of the Westinghouse Electric International Co., who has been located in the New York office for the past two years, is now on his way to Tokio, Japan, where he will act as a special representative of the company.

Charles C. Spies has been appointed district sales representative for the Faultless Rubber Co., Ashland, Ohio, in the Philadelphia territory, with headquarters at 887 Drexel Building, Philadelphia, Pennsylvania. He formerly traveled for the company in Ohio, New York, and New England.

Henry E. Baisley has been appointed manager of the Chicago office of the Hooven, Owens, Rentschler Co., Hamilton, Ohio.

E. S. Cooley has been appointed manager of the New York office of the Hooven, Owens, Rentschler Co., Hamilton, Ohio.

W. W. Wildman, former president and general manager of the Portage Rubber Co., Akron, Ohio, is organizing in Detroit, Michigan, a new \$10,000,000 corporation to be known as the Wildman Rubber Co.

EASTERN NOTES.

The General Electric Co., Schenectady, New York, has acquired the plant of the Symington Works, Leighton avenue, Rochester, New York, comprising about 125,000 square feet of floor space, to be used for the manufacture of electrical goods. The company will also open a factory at Providence, Rhode Island, for the manufacture of small electrical devices, and will construct a large machine shop at Erie, Pennsylvania.

The Link-Belt Co., Nicetown, Philadelphia, Pennsylvania, is planning a new office at its Philadelphia works, the present office to be remodeled into a shop extension.

The Consumers Tire & Rubber Co., 16 Beaver street, New York City, has increased its capital stock from \$100,000 to \$1,500,000.

The Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, will build a two-story addition to its plant at Essington, in the same state, 130 by 500 feet, at an estimated cost of \$500,000, including equipment.

The Westmoreland Chemical & Color Co. has removed its general office to the southeast corner of 22d and Westmoreland streets, Philadelphia, Pennsylvania.

The Vulcan Rubber Co., Erie, Pennsylvania, will build a factory addition for the manufacture of cord tires on West Lake Road. The addition will be two stories high, of steel, brick, and concrete, and the machinery and equipment have been ordered. The company is at present at work on a government order for tires to equip all postoffice automobiles east of the Mississippi river.

The Achilles Rubber & Tire Co., Inc., Binghamton, New York, which was reorganized in January, 1919, has been producing tires, tubes, mechanical goods and belting since August of this year, mostly for export. Plant additions are now being made which will give a capacity of 800 tires and tubes daily. The mechanical department is also being enlarged and plans are being drawn for further factory additions. The officers of the company are H. J. Smith, president; A. W. Caney, vice-president; G. L. O'Neil, secretary and treasurer.

The Hooven, Owens, Rentschler Co., Hamilton, Ohio, manufacturer of steam engines, compressors, etc., has opened branches at 2129 Land Title Building, Philadelphia, Pennsylvania, and in Richmond, Virginia, in charge of C. M. Decker and E. H. Fairchild, respectively.

The Motor and Accessory Manufacturers' Association will hold its annual banquet at the Hotel Commodore, New York City, Wednesday, January 7, at 7.30 p. m.

The following members of the Motor and Accessory Manufacturers' Association allied to the rubber industry will exhibit at the New York automobile shows: Breeze Manufacturing Co., Essankay Products Co.; General Electric Co.; Morse Chain Co.; A. Schraders' Son, Inc.; C. A. Shaler Co.; Story Rubber Co.; Westinghouse Electric & Manufacturing Co.; William-Seaver-Morgan Co.

The Atlantic Rubber Manufacturing Corp., 239 Fourth avenue, New York City, has acquired the entire capital stock of the Traun Rubber Co. and consolidated its business with its own, taking over and assuming all the assets and liabilities of the acquired business. The officers and management of the Atlantic company will remain the same.

As the first of a number of welfare projects in the interest of its employees, the Ajax Rubber Co., New York City, announces that an extensive insurance plan has been put into effect. The policies cover every individual in the organization whose service extends over a period of three months or more. By this insurance, which is the gift of Ajax to its workers, every man and woman in both the Trenton, New Jersey, and Racine, Wisconsin, factories, and sales offices, and all other people in general will benefit.

THERMOID SALES MANAGER.

JOHN T. SPICER, who has been made sales manager of the Thermoid Rubber Co., Trenton, New Jersey, is a splendid example of the self-made man with an inflexible determination to succeed.

JOHN T. SPICER.

After completing grammar school and attending high school two years, he entered Exeter Preparatory School, where he remained two years. Part of one year he attended States School, and from there entered the employ of the Maddock Pottery Co., of Trenton, as stock clerk. During this period he attended night school for one year and then took a finishing course at a West Philadelphia, Pennsylvania, school of business, later completing a full course in advertising in a correspondence school.

Winning promotion to the office of the Maddock Pottery Co., he remained there three years, when he was made a salesman in the western territory for four years. Meanwhile between trips he assisted in compiling the firm's catalogs and in planning its advertising.

Early in 1918 he resigned to become assistant advertising manager of the Thermoid Rubber Co. In October of the same year he was promoted to the position of advertising manager and has since assumed the duties of sales manager.

THE RUBBER TRADE IN NEW JERSEY.

By Our Regular Correspondent.

TRENTON NOTES.

THE COAL SITUATION kept rubber manufacturers guessing for a few days and resulted in the Empire Rubber & Tire Corp. appealing to the Government for a supply of bituminous fuel to keep the plant going. The company had but a few days' supply on hand, several carloads having been commandeered by the United States Railroad Administration. The Government finally released the coal. The other Trenton rubber concerns had larger supplies on hand, but were preparing to operate only three days a week when the ban was lifted.

Charles Howell Cook, treasurer of the Hamilton Rubber Manufacturing Co., Trenton, has been made president of the Mercer County Tuberculosis League. Mr. Cook recently devoted considerable time to visiting factories with physicians to give talks on the health of workmen and the improvement of sanitary conditions. Many of the Trenton rubber concerns also contributed financially towards the work.

Henry Young, of Trenton, has been made vice-president of the Hamilton Rubber Manufacturing Co. to fill the place made vacant by the death of William H. Servis. No other changes were made in the management.

The office force of the Thermoid Rubber Co., Trenton, held its annual Christmas dinner and minstrel show at Hildebrecht's Restaurant on December 22. About 150 persons were present, including Robert J. Stokes, secretary of the company; John T. Spicer, general sales manager, and Edmund W. Craft, purchasing agent. Harry McGowan, Warren C. Hunt, Fred C. Birkholtz, Harry W. Searfoss and Mr. and Mrs. A. H. Greywaez contributed vocal and instrumental selections. Miss Marjorie Pilger was chairman of the general committee.

The Globe Rubber Tire Manufacturing Co., Trenton, has contracted with I. Harper Clayton for a one-story building adjoining the plant on Prospect street, to cost \$6,300.

The Ajax Rubber Co., Trenton, has taken out a permit for the erection of an addition to the plant on Breunig avenue. The new structure will be three stories high, 60 by 350 feet, and will cost \$39,000. The plans have been drawn and the work will be started as soon as bids are received and contracts let.

Clifford H. Oakley, president of the Essex Rubber Co., Trenton, has been made president of the Trenton Council of Boy Scouts of America. Mr. Oakley has long been interested in all kinds of welfare work for boys. He was chairman for Trenton in last spring's drive in behalf of the National Association of Scouting, and pushed Trenton to the head of the list of New Jersey cities. Mr. Oakley is especially interested in water sports for boys and he will now help in the formation of a sea scout crew at Trenton. Charles Howell Cook, treasurer of the Hamilton Rubber Manufacturing Co., has contributed a clubhouse along Sanhick Creek for the use of the boys.

The annual meeting of the Trenton Rubber Manufacturers' Association, held on December 8 at the Trenton County Club, was largely attended. The association comprises Trenton, Philadelphia and Wilmington, Delaware, rubber manufacturers. Following a business meeting a banquet was served. Important business relating to the rubber industry was transacted and the following officers were elected: president, John S. Broughton, of the United & Globe Rubber Co.; vice-president, Charles E. Stokes, of the Home Rubber Co.; secretary, Robert J. Stokes, of the Thermoid Rubber Co.; treasurer, Alfred Whitehead, of Whitehead Brothers' Rubber Co.

The Pocono Rubber Cloth Co., recently chartered with a capital of \$500,000, will soon engage in the manufacture and sale of rubber goods at 137 East State street, Trenton. Robert R. Gulliver, of Trenton, and Neil E. Bowman and Theodore S. Cart, both of Mount Vernon, New York, are the incorporators.

MISCELLANEOUS NEW JERSEY NOTES.

The United States Rubber Co., New Brunswick, New Jersey, has come to the aid of its employees and is selling to each two pounds of brown sugar. Bags containing 1,200 pounds were sent to the factory for distribution.

The Howe Rubber Co., of New Brunswick, New Jersey, manufacturer of tires and tubes, is offering for sale 10,000 shares of preferred stock and a like amount of common stock. The company's earnings during the past year are stated as \$2,500,000.

William Henry Sayen, Jr., treasurer of the Mercer Rubber Co., Hamilton Square, New Jersey, has just been awarded the Croix de Guerre by Marshal Petain for extreme bravery while under fire. Mr. Sayen was a Y. M. C. A. worker and was constantly under bombardment during his stay overseas. Osgood Sayen, brother of W. H. Sayen, Jr., who was formerly with the Mercer Rubber Co., is now an officer in the French navy.

Philip H. Lang has been promoted from the position of New York branch manager to that of district manager for the Empire Rubber & Tire Corp., Trenton.

Frank Wallace Servis, Bloomfield, New Jersey, has been made administrator of the estate of his father, William H. Servis, who died some time ago. Mr. Servis owned a beautiful home in Trenton and other real estate.

The Duratex Co., Newark, has awarded a contract to the American Concrete Steel Co. for the erection of a rubber mill to cost \$175,000.

The Rydon Tire & Rubber Co., Asbury Park, New Jersey, has plans drawn for a brick and steel factory to cost \$100,000.

Robbers recently burglarized the store of the Joseph Sesta Tire Co. at Red Bank and escaped in a motor truck with \$30,000 worth of automobile tires.

The plant of the Johnson Rubber Co., situated in Ewing township, New Jersey, was destroyed by fire on December 12. Antonio De Piano, manager of the plant, was filling a gasoline tank when it exploded. He was fatally burned and died a week later. The plant was one story and measured 60 by 60 feet. About 250 gallons of oil were burned. The plant was owned by the Ivens Machine Co. and will be rebuilt.

The Weldon Roberts Rubber Co., manufacturer of stationers' sundries, Newark, New Jersey, reports that notwithstanding the disadvantage to the foreign buyer in the matter of exchange, the company is experiencing an unprecedented demand for its products, particularly erasers, in foreign countries. Large shipments have recently been made to Italy, Argentina, Great Britain, Russia, Japan, Australia and China.

Fifteen hundred and one shares of stock of the Boonton Rubber Manufacturing Co., Boonton, New Jersey, were sold November 25, 1919, to R. W. Seabury for \$1,501 by Francis P. Garvan, Alien Property Custodian.

THE RUBBER TRADE IN MASSACHUSETTS.

By a Special Correspondent.

NEW ENGLAND has always been the rubber footwear center of the United States, and the State of Massachusetts takes the lead. No less than 85 per cent of all the rubber footwear made or worn in the United States is produced in the three states of Massachusetts, Rhode Island and Connecticut, and 50 per cent comes from Massachusetts alone. About half of the rubber footwear manufactured is the product of female labor.

The six principal companies manufacturing rubber footwear in Massachusetts are the Hood Rubber Co., Watertown, employing 9,100 persons for the manufacture of both footwear and tires; the American Rubber Co., Cambridge, employing 3,200 persons; the Boston Rubber Shoe Co., Malden and Melrose, employing 3,000 persons; the Converse Rubber Shoe Co., Malden, employing 1,700 persons for the manufacture of both footwear and tires; the Apsley Rubber Co., Hudson, and the Woonsocket Rubber Co., Millville. Of these the American Rubber Co., the Boston Rubber Shoe Co. and the Woonsocket Rubber Co. and subsidiaries of the United States Rubber Co., which has 50 factories of one sort or another, of which 17 in various states are largely devoted to the manufacture of footwear.

The largest single rubber footwear factory in the world, however, is that of the Hood Rubber Co., which has an average capacity of 65,000 pairs daily and has run a ticket as high as 72,000 pairs, and makes 20 per cent of all the rubber footwear produced in the United States. The Malden and Melrose plants of the Boston Rubber Shoe Co. also have a daily capacity in excess of 60,000 pairs. The Apsley Rubber Co. has one of the most completely equipped rubber footwear plants in the country, with a capacity of 20,000 pairs daily.

The 12,000 employees at the West Lynn plant of the General Electric Co. are being insured at the company's expense. Each man or woman in the company's employ one year will be insured for \$500; two years, \$750; three years, \$1,000; four years, \$1,250, and five years or more \$1,500. Should an employee leave the company's service the insurance ceases, but may be continued through payments by the individual insured.

A 100 per cent American plant by September, 1920, is the goal which the Boston Woven Hose & Rubber Co., Cambridge, has set for itself. Very few aliens have been hired during December, and the policy of giving preference to American citizens is bringing satisfactory results. It may take a little longer to fill the job, but the job stays filled longer.

Twice a week, during the noon hour, an Americanization class is held in the recreation room of the plant for the benefit of

foreign-born employees, and the firm is pleased to render every assistance possible to such aliens in taking out citizenship papers. A class of twenty-five men has been enrolled and additional classes will be formed as soon as teachers can be secured.

Guy D. Niles, formerly manager for The Portage Tire & Rubber Co., is now in charge of the New England branch of the Gillette Tire Co., with offices and salesrooms at 587 Boylston street, Boston. Mr. Niles has grown up in the business of merchandising automobile tires and has a wide acquaintance throughout New England.

On December 9, the officers and plant managers of Everlastik, Inc., 52 Chauncey street, Boston, held a get-together meeting at the Boston City Club during which many ideas for the improvement of working conditions in the several mills were discussed. Those present were B. T. Martin, president; John Page, treasurer; W. B. Spencer, general manager; Charles Stretch, sales manager; Walter Martin, H. J. Martin, L. B. Chisholm, Arch. Martin, Alfred Martin, Sol. Kendrick, Henry Turner, Walter Dalby, Samuel Lounds, F. Gramelsback, A. S. Howard, Samuel Kendrick, W. Painter, Thomas Dreier, Wilwyn Herbert and Charles Lake.

Samuel K. Nason, director of vocational education in Brookline, a suburb of Boston, announces evening classes in automobile instruction, free to residents of Brookline, which will place students in a position to qualify for a chauffeur's license from the state. The care and repair of tires form part of the course, which is to be conducted by Robert V. Dallison, instructor for the Coast Artillery Motor Corps and the Y. M. C. A. Automobile School.

In order to provide additional capital to meet the increased demand for George Grow cord and fabric tires, the George Grow Tire Co., 323 Columbus avenue, is offering to the public 50,000 shares of non-assessable common stock at par, \$10 per share. The factory at Canton Junction is producing 600 tires weekly, and as this output is consistently oversold the capacity will be increased to 6,000 tires weekly. The firm's product is marketed through a chain of stores operating in many leading New England cities.

L. J. Mutty, of the L. J. Mutty Co., manufacturer of automobile top fabric, Boston, has left for a sojourn of several months on the Pacific Coast, taking his motor car and golf sticks with him. W. N. Shelton, general manager of the company, reports that the demand for "Dridek" on the part of leading automobile manufacturers has quadrupled and that the export business is far above normal.

The Worco Tire Co., Worcester, also distributor for the Paige automobile, has been purchased by the R. C. Cann Co., of Boston. In the spring the new concern will build a large garage and service station near the present salesrooms.

NEW AJAX PLANT AT SANDUSKY, OHIO.

Horace DeLisser, president of the Ajax Rubber Co., Inc., New York City, recently announced that a new Ajax factory will be erected in Sandusky, Ohio, where ninety acres of land have been secured. The erection of the new plant will begin at once and by the latter part of 1920, tire production will be well under way. This is the third factory for Ajax, the others being in Trenton, New Jersey, and Racine, Wisconsin.

A housing plan for employees is being developed along with other welfare activities. Between 1,000 and 1,500 homes for Ajax workmen will be erected in Sandusky. Details for this housing plan which will be along lines similar to the housing project already under way at Racine, are now being worked out by the Ajax Industrial Welfare Department.

Discussing the plans for the new Ajax plant, Mr. DeLisser

expressed his keen appreciation of the cooperation of the Sandusky Chamber of Commerce, which organization played an important part in making the project a reality.

MANAGER OF THE MALAY RUBBER CO.

OWEN MOYNIHAN, for the past two years general sales manager of the Amazon Rubber Co., Akron, Ohio, has resigned to assume active management of The Malay Rubber Co., which is being organized by distributors and dealers in all parts of the country for the purpose of manufacturing and merchandising a high-grade tire in a new plant to be built at Cleveland, Ohio.

OWEN MOYNIHAN.

Before his Amazon connections, Mr. Moynihan was eastern district representative of two Akron rubber companies, and previous to that time was in the offices of distributors. His broad understanding of tire distribution eminently fits him for his new position. In The Malay Rubber Co. will be associated with him tire experts to care for every phase of manufacture, production, sales and advertising.

CHAIRMAN OF GOODYEAR'S BOARD OF CONTROL.

W. D. SHILTS, assistant secretary of The Goodyear Tire & Rubber Co., Akron, Ohio, and chairman of the board of control, was graduated from Mt. Union College and began the study of law in Cleveland. Finding that it would be

W. D. SHILTS.

necessary to get work to pay his way while studying in 1904, he answered in person an advertisement for a stenographer placed by C. W. Seiberling in a Cleveland paper. Arriving in Akron, he was immediately engaged as the personal secretary of the then manager of the automobile tire department, at a time when the Goodyear output was 25 tires a day.

Close application and a comprehensive grasp of details brought him promotion after four months. He was placed in charge of the correspondence of the tire department, and at the end of two years a realization of his opportunities with the Goodyear organization led him to abandon the thought of a career at the bar.

From that time his rise was rapid. He was soon made assistant to G. M. Stadelman and chosen as head of the automobile tire department, then selected as manager of the salesmen's department. His broad vision, coupled with exceptional executive ability, quickly brought further recognition, and he was made chairman of the board of control. Recently he was made assistant secretary, and so became one of the officials fourteen years after joining the company at the bottom of the ladder. Mr. Shilts will continue to act as chairman of the board of control.

"CRUDE RUBBER AND COMPOUNDING INGREDIENTS" AND "RUBBER MACHINERY," by Henry C. Pearson, should be in the library of every progressive rubber man.

THE RUBBER TRADE IN OHIO.

By Our Regular Correspondent.

MORE THAN 200 MEMBERS of the Detroit and Cleveland sections of the Society of Automotive Engineers held a two-day session at Akron, Ohio, December 1 and 2, as the guests of The Goodyear Tire & Rubber Co. The meeting was held for the purpose of presenting technical information pertaining to the application of pneumatic tires to motor trucks. The visitors witnessed a demonstration of a new development in truck design, the tandem axle construction—Goodyear's contribution to the truck industry.

Monday evening the engineers were guests at a banquet at which F. A. Seiberling, president of the company, and P. W. Litchfield, factory manager, made far-sighted predictions as to the future of the motor truck industry. Mr. Seiberling declared that within three years the solid tire would be obsolete and that the fabric tire would soon be supplanted by the pneumatic cord tire. Mr. Litchfield stated that the trolley car must go as a means of transportation—to be succeeded by the motor bus.

The visitors were taken on tours of the Goodyear factory, saw many interesting exhibits and enjoyed athletic sports in the company gymnasium. Four of them, selected by lottery from the 200 delegates, made a balloon flight with Ralph H. Upson, the Goodyear aeronautical engineer.

The Goodyear committee in charge was composed of C. R. Johnson, C. M. McCreery, J. E. Hall, W. S. Wolfe and E. R. Preston.

AKRON NOTES.

The Miller Rubber Co., Akron, has followed the example of the Firestone Tire & Rubber Co. in establishing a cooperative store for its employees. At present the store is handling only a comparatively small line of merchandise, but the plans of the company include its expansion until all commodities usually sold in a general store are included. A. R. Kiester is manager of the store.

The General Tire & Rubber Co., Akron, is completing the second addition to its plant made during the past six months. The addition is 120 feet long and 60 feet wide. Officials of the company estimate that their business this year will be considerably over \$5,000,000.

The B. F. Goodrich Co. has erected garages near its plant where more than 500 employes can house their automobiles while they are at work.

George W. Sherman, for eighteen years connected with the reclamation department of The B. F. Goodrich Co., has resigned and will leave the employ of the company the first of the coming year. During the past few years he has developed the Akron Salvage Co., a company formed to save waste unclaimable through the ordinary channels, to such an extent that he will devote practically all his time to this work.

A machine gun company belonging to the Ohio National guard has been organized by employes of The B. F. Goodrich Co.

The B. F. Goodrich Co. recently announced that at the end of the year all the salaried employes of the company would receive bonuses of 25 per cent of their salary. More than 6,000 employes will thus receive bonuses totalling \$2,000,000. Wage advances have been made during the course of the year so that no general bonus for the employes in the factory is anticipated.

At present more than 2,300 persons of foreign birth are taking the Americanization courses in the schools conducted in the rubber factories and the public schools under the direction of E. C. Vermillion, formerly connected with the Firestone Tire & Rubber Co. There are 128 classes served by 105 specially trained teachers.

The Summit Mold & Machine Co., Akron, will build a machine shop in the near future.

Work has begun on a warehouse for crude rubber and manufactured products and a new machine shop for the Firestone Tire & Rubber Co. in connection with buildings 32 and 33. The new buildings will cost approximately \$185,000 and the company hopes to have them ready by the first of the year.

The Portage Rubber Co. has broken ground for its new \$200,000 factory building, the first unit of an entirely new plant. The building is to be 80 by 200 feet, three stories high, and is to be built with provisions for the addition of two more stories as soon as business warrants. At a recent meeting of the stockholders the announcement was made that business had increased 25 per cent since the signing of the armistice.

Ground has been broken for the first unit of the Doyle Tire & Rubber Co.'s plant on a 50-acre site recently purchased in Akron.

The new concern was recently organized with a capitalization of \$300,000 by members of the family of Judge D. A. Doyle. The first factory building will be 54 by 110 feet.

The Phoenix Rubber Co. has received from the city building department, of Akron, a permit to erect a three-story brick building as an addition to its present plant. The addition will cost approximately \$60,000 and will be 60 by 120 feet.

The Miller Rubber Co., Akron, has announced plans to build a \$1,750,000 power plant and other factory extensions near Kenmore, which is in the greater Akron territory.

The American Rubber & Tire Co., Akron, has arranged to call in \$350,000 worth of 7 per cent preferred stock outstanding before recapitalizing next spring for \$2,000,000. The stock is being called in at 107.

The strike of the bituminous coal miners did not materially affect the rubber factories of Akron or vicinity because each of the companies had sufficient coal to last at least 30 days when the strike was declared. Business was hampered somewhat, however, by an embargo placed on incoming freight due to congestion in the local yards, making it difficult to get shipments of materials.

During the first part of December the Goodyear Tire & Rubber Co. was granted permits for additions to its factory to cost approximately \$1,500,000.

The largest single shipment of crude rubber ever received in Akron was consigned to The Goodyear Tire & Rubber Co. in December, and amounted to 3,000,000 pounds, valued at \$1,500,000.

The business of The Goodyear Tire & Rubber Co. during the past year amounted to approximately \$250,000,000, it was announced at the annual meeting of the directors and stockholders.

F. A. Seiberling, president of the company told the stockholders that in his opinion the business of the company would be twice that amount for the year 1920. Profits of the company amounted to \$23,277,245.29. During the preceding year the sales of the company totaled \$131,247,382.45 and the profits \$15,388,190.

At the meeting of the directors the same officers who have served during the past year were reelected, except that W. E. Palmer was elected secretary besides being reelected treasurer. W. D. Shilts was elected assistant secretary.

Announcement has been made that The Goodyear Tire & Rubber Co., Akron, will soon erect a \$200,000 dormitory for women near the plant. The building will house 175 women, it is estimated.

William O'Neill, a member of the welfare department of The Goodyear Tire & Rubber Co., and William Kroeger, manager of the Coventry Land & Improvement Co., a subsidiary company of the Firestone Tire & Rubber Co., have been elected members of the Akron city council.

The commercial representatives of England, France, Italy and Belgium, who visited the United States and attended the world trade convention held at Atlantic City, spent November 15 inspecting the rubber plants of Akron and were entertained at the Portage Country Club in the evening.

The Chamber of Commerce has prepared statistics concerning the business of Akron which indicate that during the past year the output of local industries amounted to \$522,436,020, and the pay-roll of the city to \$117,974,890, and the capitalization to \$272,853,770. The production of the city at present is estimated at approximately 200,000.

The employees of the Akron rubber factories contributed the major portion of the \$1,500,000 placed in the peace chest which has been organized to finance thirty-three welfare organizations of the city.

SOUTHERN DELEGATION OF AUTOMOBILE DEALERS AT AKRON.

Early in December a delegation of forty Chandler and Cleveland automobile dealers from Oklahoma, New Mexico, Panhandle Texas and Arkansas was entertained by The B. F. Goodrich Co., and the manufacture of tires demonstrated from start to finish. The trip was conducted by the Markham Motor Co., Oklahoma City, Oklahoma, the party traveling in a special Pullman coach. Automobile, tire and accessory factories were also visited in St. Louis, Indianapolis, Cleveland, Detroit and Chicago. The dealers returned to their respective territories fired by the optimism of the great automobile centers and better equipped to demonstrate cars and talk tires convincingly and profitably.

At the recent annual meeting of the stockholders of the Williams Foundry & Machine Co., Akron, Ohio, the following officers were elected: F. E. Halcomb, president; S. F. Ziliox, vice-president; G. Carl Dietz, treasurer; William J. Slater, secretary and assistant treasurer; Charles Reymann, Charles Herberich and A. W. Burnett, additional directors.

The company's plant is working to capacity on vulcanizers and miscellaneous machinery for the building and repair of tires. The demand for repair equipment is especially good at this time.

M. M. Whorley has been appointed assistant sales manager of The Mason Tire & Rubber Co., Kent, Ohio.

The Columbia Tire & Rubber Co., Columbiana, Ohio, will build a new plant in Mansfield, to be known as Plant No. 1. Stock to the extent of \$500,000 has been issued and disposed of

to provide funds for the purpose. The company's general offices will be removed to the new building as soon as completed.

The Henderson Tire & Rubber Co., Inc., Bucyrus, Ohio, is moving to its new plant on West Goodale street, Columbus, where it expects to produce about 1,500 tires daily. C. O. Henderson is president and treasurer Joseph Friedman, vice-president; and George C. Riley, secretary.

The Ultimate Tire & Rubber Co., Cleveland, Ohio, has bought a site of 12.6 acres of land at Collamer and East 152d street, touching the main line of the Nickel Plate railroad, where it will build its plant.

Ground has also been broken and construction begun on the buildings for the Excel Rubber Co., at Wadsworth, near Akron. The company recently organized with a capitalization of \$600,000 of which only \$100,000 is to be sold at this time, and that sale restricted to the citizens of Wadsworth.

R. C. Holman has been placed in charge of all blowing engines of the Hooven, Owens, Rentschler Co., Hamilton, Ohio.

The McLean Tire & Rubber Co., East Liverpool, Ohio, is completing a factory addition, 100 by 150 feet, two stories in height, of brick and steel construction, into which it expects to move about February 1, when production will be increased to average 1,000 tires daily. On December 1 the company began the manufacture of McLean cord casings, which completes its line of tires and tubes.

The Knox Tire & Rubber Co., Mt. Vernon, Ohio, will build a three-story factory building, 100 by 225 feet, to cost about \$170,000.

The Ashland Tire & Rubber Co., Ashland, Ohio, will build a new tire plant.

MID-WESTERN NOTES.

By a Special Correspondent.

THE GENERAL ELECTRIC CO., Schenectady, New York, will build a new factory at Decatur, Indiana, 260 by 360 feet, for which site was recently purchased.

The Sewell Cushion Wheel Co., Detroit, Michigan, has bought 10½ acres of land at the corner of Harper avenue and the Detroit Terminal Railway, where it will immediately erect dry kilns and warehouses. Manufacturing for the present will continue at the company's building at Gratiot and Beaufait avenues.

The Michelin Tire Co., Milltown, New Jersey, has opened factory branches at 514 Mulberry street, Des Moines, Iowa, and at 26 West Woodbridge street, Detroit, Mich., both to be under the supervision of R. B. Tracy, district manager. The State of Iowa, eastern Michigan and northwestern Ohio territory will be covered.

A. Plamondon Manufacturing Co., 12-24 North Clinton street, Chicago, Illinois, is building a one-story machine shop and foundry on its property at 53d street and Western avenue, to cost approximately \$400,000. This company manufactures gearing and friction clutches as well as special machinery for the rubber trade.

The Gillette Rubber Co., Eau Claire, Wisconsin, which bought the business of the Chippewa Rubber Co., of the same city, some months ago, is continuing to manufacture the same products, namely, waterproof material for raincoats.

In order to take care of the increasing demand for its malleable iron chains for elevating, conveying and power transmission purposes, the Link-Belt Co., Chicago, Illinois, is completing its Belmont foundry at Indianapolis, Indiana, as originally laid out. The new building will be about 400 by 70 feet, and the necessary rolling mills, sand blast and other equipment will be installed as soon as possible, also a furnace of 15 tons capacity.

The Montana Cord Tire Co., Inc., 409 Central avenue, Great Falls, Montana, manufacturer of Montana cord and fabric tires, was incorporated in that state on May 28, 1919, with a capitalization of \$500,000. It also intends to manufacture inner tubes and rubber sundries. The officers are: Clarence J. Drope, vice-president; J. R. Swan, secretary and treasurer. The office of president is vacant at present. The concern has bought a building 175 by 60 feet, near the Missouri river and two transcontinental railroad lines, and expects to place its tires on the market about May 1, 1920. The Montana tire is of heavy construction, having three layers of cord laid diagonally and individually insulated, with the intent to adapt it to the conditions of local roads. There is also a special patented attachment to the bead of this tire.

The International India Rubber Corp., South Bend, Indiana, has broken ground for a factory addition for the installation of three new mixing mills, one large-size calender, and three new vulcanizers, which it is expected will bring the capacity up to 800 tires and tubes daily.

The Goodyear Tire & Rubber Co., Akron, Ohio, has begun the construction of a new building at West 39th street and Winchester avenue, Chicago, to accommodate the Goodyear organization in that city. The building will have four stories and basement and be of reinforced concrete, containing 200,000 square feet of floor space. A private track and tunnel will be built for incoming freight, giving access to the central freight station and express receiving room.

THE PARKER TIRE & RUBBER CO.

A distinctive feature of the new factory of the Parker Tire & Rubber Co., at Indianapolis, Indiana, is that it is all white, including the driveways, entrance posts and all the inside wood-

PLANT OF THE PARKER TIRE & RUBBER CO.

work. This is in accordance with the company's advertising scheme which starts with a white strip on the tires if manufacturers and is continued in the pure white trucks and service and pleasure cars.

The Parker company claims to be the only one in the country specializing absolutely in cord tires; it makes no tubes or rubber goods of any kind, no plain tread, rib tread or fabric tires. It manufactures only the one non-skid design, which it calls a combination non-skid and rib tread. The capacity of the factory is 500 cord tires a day. The tires are almost as large as the next standard oversize and are therefore called super-size cord tires. The company's plan is to extend its business, especially in the south, having already been successful throughout the southwest territory.

ACCESSORY FIRM TO MAKE TIRES.

The A. J. Stevens Rubber Co., Kansas City, Missouri, manufacturer of tire accessories and fabric products, has entered the tire manufacturing field with the Stephens White Tread Tire, guaranteed for 6,000 miles. Inner tubes are also being produced. The present capacity of the plant is 300 casings a day, and this will be increased as new machinery is installed.

The company began in 1916 with six employees, and has outgrown two plants. Its production of blowout patches has reached 3,000,000 annually, and of fan belts 2,000,000. The capital stock was recently increased to \$1,500,000, and the expansion into tire and tube making will increase the number of employees to 500 or 600.

PACIFIC COAST NOTES.

By Our Regular Correspondent.

LOS ANGELES NOTES.

C. E. HENSON, secretary to vice-president and general manager A. F. Osterloh, of the Goodyear Tire & Rubber Co., of California, has arrived in Los Angeles and assumed charge of the local office. Mr. C. Henson, who is a native of Ohio, is well acquainted with California, having spent five years in this state, during which he served as secretary to the treasurer and the board of trustees of Leland Stanford Junior University, secretary to the vice-president of the Panama-Pacific Exposition, and was also in the Goodyear office in San Francisco.

J. J. Rafferty, director of the Philippine Bureau of Commerce and Industry, was a recent visitor in Los Angeles, making the rounds of business houses to urge the importance of recognizing Manila as the American shipping base of the Orient. Mr. Rafferty pointed out that the Philippines are now exporting to the United States more than a dozen commodities, not the least of which is rubber, of which there are over 2,000 acres under cultivation in the islands.

Henry Joseph, field sales manager of the Re Miller Rubber Co., Ashland, Ohio, has closed a deal in Los Angeles by which the Western Auto Supply Agency will handle exclusively the "Re Miller," a complete interliner.

Fifteen carloads of Osler-Racine tires recently arrived in Los Angeles to supply the demand for this particular make of tires in Southern California.

Considerable discussion has arisen lately in southern California over the inflation scale adopted by the Tire and Rim Division of the Society of Automotive Engineers. The western theory seems to be that no standard inflation scale will fit all conditions—that the load carried in the rear is most important in determining the amount of air pressure, and that the road conditions alter every standard rule. H. O. Alexander, special representative of The Miller Rubber Co., Akron, Ohio, with headquarters in San Francisco, says: "According to the S. A. E. scale, a five-inch cord tire should carry a pressure of 80 pounds. Undoubtedly that may be true from the standpoint of an average pressure for maximum riding comfort, but on the splendid roads of California those figures are by no means conducive of maximum mileage. The S. A. E. scale is not definitely applicable in all cases for the simple reason that every tire should be inflated strictly according to the work it is doing."

S. S. Abrams, of Los Angeles, general manager of the Superior Tires Corporation, has secured the local distributing agency for Mohawk tires.

Howard Reed, of Los Angeles, is successor to the retail business of the Wade Tire & Rubber Co., distributors for the Canton cord and the Knight & Blackstone fabric tires on the Pacific Coast.

J. V. Mowe, assistant general sales manager of the Kelly-Springfield Tire Co., New York City, was a recent visitor in

Los Angeles during the progress of a tour of inspection in all the western territory.

Los Angeles city officials are just now wrestling with the problem of completing Municipal Power Plant No. 2 in the San Francisco canyon by May 1, so that it will be ready to supply power to the \$12,000,000 Goodyear Tire & Rubber Co.'s plant. More money is required at once, some \$750,000 being needed to meet outstanding contracts on Plant No. 2 and at the Owens river gorge.

F. A. Seiberling, president of The Goodyear Tire & Rubber Co., recently arrived in Los Angeles to inspect the progress on the company's new plant. He is confident it will be completed by July 1, and declares that fully 15 per cent of the company's total output will come from the local factory. Mr. Seiberling states that other eastern tire manufacturers are preparing to locate plants here and that automobile manufacturers will follow.

Speaking of cotton prospects, Mr. Seiberling said that the development of the Salt river district has been something marvellous, the acreage having been expanded until this year there are more than 50,000 acres planted. Growers are predicting the best crop in the history of the valley. Floods have done some damage, but this will not amount to more than 15 per cent of the entire crop. The Goodyear company has bought two-thirds of the Salt river crop and would have purchased it all had that been possible.

Work on the installation of the fire-fighting facilities in the city's new cotton compress building at Los Angeles harbor has been completed and work on the first orders of cotton has already been started. Orders for the compressing of 3,000 bales were received during December, while dozens of inquiries were received from Imperial Valley planters. The cotton compress has a maximum capacity for 24 hours of 2,500 bales, or about 1,000 bales for an eight-hour day.

Word received in Los Angeles indicates a rapid increase in the rubber and tire vulcanizing business in Honolulu. The great influx of tourists has taxed the automobile capacity of the Hawaiian Islands to its utmost capacity. The Honolulu Rubber Works has been forced to enlarge its salesrooms and vulcanizing department. A thoroughly up-to-date tire repair department will be established.

A novel use for rubber tires was recently discovered at Long Beach, the largest city in close proximity to Los Angeles. The suspicions of the police were aroused by the frequent visits to a bicycle store, and a detective paid a visit to it.

"A little puncture," he remarked to the proprietor.

"Whata u lika, wiska or branda?" was the enigmatic reply. The detective said he was taken to the back of the shop where two tires, one full of brandy and the other of whiskey, dangled from a rack. By placing his mouth over the valve stem a most exhilarating puncture preparation could be obtained at 50 cents a swallow. The detective seized a small still operated in connection with the tire establishment.

Bruno J. Becker, general manager of the Gale Henry Comedy Co., of Los Angeles, has an invention which he hopes may serve to prevent tire thefts from which he has suffered recently. Locks on the tires proved to be of little avail, so he has concealed underneath his car a bell, which will start ringing immediately the tire is removed from the rack in the rear and continue until the battery has run down.

R. C. Schlesinger, sales manager of the Keystone Tire & Rubber Co., New York City, is in Los Angeles to spend the winter. He has seen the organization grow from one store to its present chain of 180. He will visit all the Keystone stores in the West during his visit.

J. E. Argus, of San Francisco, who has been district manager of the Goodyear Tire & Rubber Co., has been transferred to

Los Angeles to become manager of the mechanical goods department. Mr. Argus joined the force in San Francisco on July 15, 1913, and became manager of the mechanical goods department on November 15, 1915. Frank E. Carroll was appointed to succeed Mr. Argus in San Francisco. Mr. Carroll has been in the employ of the company for 12 years, having entered its service on April 10, 1907. He is president of the Downtown Association and a member of the Olympic Club.

SAN FRANCISCO NOTES.

The United States Rubber Co., San Francisco, will shortly occupy larger quarters at Second and Folsom streets, where all business of the branch will be conducted.

Sam J. Turnis, general sales manager of the tire division of the Brunswick-Balke-Collender Co., New York City, has perfected plans for an active sales campaign in northern California. The Frank A. Busse Sales Co. has been appointed Brunswick tire dealer in San Francisco, Oakland, Alameda and Berkeley. San Francisco is to be the headquarters of the company in the Far West.

H. Senn, head of the tire department of Chanslor & Lyon Co., San Francisco, distributor of Lee tires, has just returned from a distributors' conference held in the Lee factory at Conshohocken, Pennsylvania, where sixty were in attendance.

The Ideal Tire & Rubber Co., Cleveland, Ohio, plans to complete its representation on the Pacific coast. A. S. Davies, treasurer, and D. C. Hathaway, general sales manager, were recent visitors in San Francisco for the purpose of appointing a northern California distributor for the Greyhound line. They visited their distributors in Spokane, Portland and Seattle.

Roy R. Meads, president of the Pacific Rubber Co., of Los Angeles, has opened a new salesroom for the company at 950 Mission street, San Francisco. P. H. Stortz, former sales manager, is in charge. The company is distributor of the Horse-shoe pneumatic tires on the Pacific Coast.

The Power Rubber Co., of San Francisco, distributor of Racine tires, entertained its dealers, agents and branch managers recently. The men came from the entire territory, including Del Norte County in the north and Bakersfield in the south. After a series of business talks they were guests of the company at Tai's at the beach. Over 100 covers were spread. Horace de Lijser, president; R. Y. Cooke, general sales manager, and Robert B. Crane, manager of the material and sundries department, were present at the gathering.

MISCELLANEOUS WESTERN NOTES.

L. B. Broering, factory representative of The Mason Tire & Rubber Co., Kent, Ohio, was recently in Sacramento in connection with a large warehouse which his company is preparing to establish on the Pacific Coast.

George Bellis, recently Los Angeles branch manager of the Goodyear Tire & Rubber Co., has been promoted to the position of district manager of the northwestern district, with headquarters at Portland, Oregon. Mr. Bellis started his career with the Goodyear company as mechanical goods salesman on July 27, 1913, covering Nevada and northern California, and since that time has been one of the prominent factors in the rapid growth of the Goodyear Pacific Coast business. In December, 1914, he was appointed branch manager at Sacramento, and was there until June, 1917, when he was ordered south to take charge of the Los Angeles branch. Since Mr. Bellis has been located in Los Angeles he has taken an active part in public affairs and has become very well known to the tire trade.

THE RUBBER COMMITTEE OF THE JAMAICA AGRICULTURAL SOCIETY has reported that the planting of *Castilleja* is not profitable, and that it is not advisable to continue planting the trees for shade on the cacao plantations, save in certain cases.

The Mid-West Rubber Manufacturers Association.

First Annual Meeting and Banquet.

FIRST ANNUAL BANQUET OF THE MID-WEST RUBBER MANUFACTURERS ASSOCIATION, HELD AT THE CHICAGO ATHLETIC CLUB, CHICAGO, ILLINOIS, DECEMBER 6, 1919.

THE FIRST ANNUAL MEETING AND BANQUET of the Mid-West Rubber Manufacturers Association took place at the Chicago Athletic Club on Tuesday evening, December 9. The business meeting was held at 2 P. M. on the same day and was well attended by members of the Association and their guests. After the customary routine which included reading of the minutes, treasurer's report, etc., the chairman, John W. Maguire, president of the Association, called upon several of the members for remarks relating to the various industries which they represented.

Thomas M. Gardner of the Brighton Mills spoke on the tire fabric situation and incidentally said that every indication pointed to a shortage of cord material, and advised that in the premises it might be well for manufacturers to figure on providing for other types on the ground that if an adequate supply of cord tires could not be turned out, pneumatics of some other character would naturally be substituted. He particularly inveighed against the use of low-grade cord because of its effect on the finished product.

Charles T. Wilson of Charles T. Wilson Co., Inc., said that it was his opinion there would be at least a sufficient supply of crude rubber to correspond with the amount of fabric available.

Wesley E. Wilson of the Akron Rubber Mold & Machine Co. spoke informally on the subject of rubber molds.

The next speaker, A. G. Hanauer, president of the Washington Tire & Rubber Co., gave an attractive description of the Northwest generally and Spokane specifically as a most available lo-

cation for rubber manufacturing concerns. He said that manufacturing conditions were ideal, including labor, which was one hundred per cent American.

Ohio as a rubber manufacturing center was defended by W. C. Owen of the Owen Tire & Rubber Co., who claimed that because of shipping facilities and proximity of supplies there was no superior location. W. W. Wuechter of the Nebraska Tire & Rubber Co., manifested a high regard for Omaha as a rubber manufacturing point.

The secretary read a paper on Industrial Relations from the Rubber Club of America, suggesting the cooperation of the Mid-West Association in that the combined organizations might act as a unit in facilitating relations between employer and employee.

The following nominating committee was appointed by Mr. Maguire: Clark H. Bennett, Featheredge Rubber Co., M. S. Ackles, Lincoln Highway Tire Co., F. I. Chichester, Twin Tube & Rubber Co., J. F. Benner, Electric Rubber Reclaiming Co., J. B. Gabeline, Standard Four Tire Co., and the following directors were elected:

John W. Maguire, Portage Rubber Co., John T. Christy, Hawk-eye Tire & Rubber Co., C. H. Wright, Racine Auto Tire Co., George B. Dryden, Dryden Rubber Co., F. I. Chichester, Twin Tube & Rubber Co., D. M. Mason, The Mason Tire & Rubber Co., and W. W. Wuechter, Nebraska Tire & Rubber Co.

The dinner, which commenced at seven o'clock in the banquet hall of the Chicago Athletic Club was one of the happiest func-

tions of its kind. The general arrangements, including the menu, music and cabaret, were all of noteworthy class that reflected with credit the management of John W. Maguire who also officiated most acceptably as toastmaster.

The principal speaker of the evening was John Fletcher of the Fort Dearborn National Bank of Chicago, who dealt exhaustively with financial, industrial and agricultural conditions of the West. He delivered a most informing speech, which was enthusiastically applauded. The other speakers were Theodore Eugene Smith of the "India Rubber Review," who spoke in his usual happy and instructive vein which carried a strong appeal to all those present. E. F. Pfaff of THE INDIA RUBBER WORLD referred in a congratulatory manner to the marked progress of the association and the very genial character of the meeting and dinner.

Both the meeting and the banquet demonstrated that, while the Association is still in the yearling class, it is in every other respect well grown and amply constituted to rank with the best organizations of its kind. Following is a list of those attending the meeting and banquet:

MEMBERS AND GUESTS.

Aekles, M. S.	Lincoln Highway Tire Co.	Fulton, Ill.
Allen, S. D.	Racine Auto Tire Co.	Racine, Wis.
Barnes, J. P.	Cupples Company	St. Louis, Mo.
Barton, Walter C.	Dryden Rubber Co.	Chicago, Ill.
Besser, J. S.	Electric Rubber Reclaiming Co.	Barberton, Ohio.
Bennet, Clark H.	Featheredge Rubber Co.	Chicago, Ill.
Bostwick, S. E.	Gillette Rubber Co.	Eag Claire, Wis.
Broadhead, Garrett, Jr.	Central Rubber Co.	Defiance, Ohio.
Buchter, O. G.	Newsom Valve Co.	St. Louis, Mo.
Cantor, C. A.	Lion Tire & Rubber Corp.	Lafayette, Ind.
Chichester, F. L.	Twin Tube & Rubber Co.	Chicago, Ill.
Connors, A. V.	Horse Shoe Rubber Co.	Chicago, Ill.
Davis, A. F.	Ideal Tire & Rubber Co.	Cleveland, Ohio.
Davis, I. R.	Ideal Tire & Rubber Co.	Cleveland, Ohio.
Drake, R. E.	Indanapolis, Ind.	Indanapolis, Ind.
Dunbar, Frank J.	J. Frank Dunbar Co., Inc.	New York, N. Y.
Eyer, F. R.	Standard Four Tire Co.	Keokuk, Ia.
Fletcher, J.	Fort Dearborn National Bank	Chicago, Ill.
Follen, J.	Lion Tire & Rubber Corp.	Lafayette, Ind.
Follen, Thos.	Lion Tire & Rubber Corp.	Lafayette, Ind.
Gresham, Chas.	H. Muehlstein & Co.	New York, N. Y.
Fabline, J. B.	Standard Four Tire Co.	Keokuk, Ia.
Gardner, Thos. A.	Brighton Mills	Passaic, N. J.
Gereke, Edw. G.	Gereke-Alten Carton Co.	St. Louis, Mo.
Hanauer, A. G.	Washington Tire & Rubber Co.	Spokane, Wash.
Harris, W. J.	National-Standard Co.	Niles, Mich.
Harris, S. W.	The Akron Rubber Mold & Machine Co.	Akron, Ohio.
Hayes, C. W.	Dykes Tire Machine Co.	Chicago, Ill.
Henderson, H. H.	E. R. Henderson & Co.	New York, N. Y.
Hern, Emil	Pierce Wrapping Machine Co.	Chicago, Ill.
Hoffman, Chas.	The Mansfield Tire & Rubber Co.	Mansfield, Ohio.
Horn, F. J.	Fred. Stern & Co.	New York, N. Y.
Jenkins, W. C.	"The New York Commercial"	New York, N. Y.
Kendall, J. A.	J. A. Kendall	Akron, Ohio.
Lahay, F. T.	Pool & Kelly	Akron, Ohio.
Le Fan, L. N.	C. T. Wilson Co., Inc.	New York, N. Y.
Maguire, J. W.	The Portage Rubber Co.	Akron, Ohio.
Mathias, J. Jr.	Mineral Point Zinc Co.	Chicago, Ill.
Meyer, F. R.	E. R. Henderson & Co.	New York, N. Y.
Mock, D. A.	Raw Products Co.	New York, N. Y.
Moran, D. M.	C. J. Tagliabue Manufacturing Co.	Brooklyn, N. Y.
Muehlstein, Chas.	H. Muehlstein & Co.	New York, N. Y.
Oscars, E. B.	The Majestic Tire & Rubber Co.	Indianapolis, Ind.
Owen, W. C.	The Owen Tire & Rubber Co.	Bedford, Ohio.
Parker, Paul R.	Parker Tire & Rubber Co.	Indianapolis, Ind.
Parkin, W. H.	National-Standard Co.	Niles, Mich.
Plaff, E. F.	"The India Rubber World"	New York, N. Y.
Pough, F. H.	Southern Acid & Sulphur Co.	St. Louis, Mo.
Puhlman, C. M.	J. H. Lane & Co.	New York, N. Y.
Ramsay, H. W.	Cupples Company	St. Louis, Mo.
Reeves, Geo. C.	Dryden Rubber Co.	Chicago, Ill.
Roberts, Preston E.	The Perfection Tire & Rubber Co.	Fort Madison, Ia.
Rutter, Frank S.	Chas. E. Wood	New York, N. Y.
Sawyer, Chas. F.	Sioux City Tire & Manufacturing Co.	New York, N. Y.
Smith, Theo. E.	"The India Rubber Review"	Akron, Ohio.
Smith, Mark L.	Stressen, Reuter & Hancock	Chicago, Ill.
Spaul, J. Richard	J. Frank Dunbar Co., Inc.	New York, N. Y.
Stenson, C. C.	Wilson Tire & Rubber Co.	Springfield, Ill.
Stepan, A. C.	The Roessler & Hasslacher Chemical Co.	New York, N. Y.

Stern, Alfred	H. Muehlstein & Co.	New York, N. Y.
Sutwell, W. H.	Feat Rubber Co.	Cuyahoga Falls, Ohio
Syfers, R. H.	The Majestic Tire & Rubber Co.	Indianapolis, Ind.
Taveniere, C.	Chas. E. Wood	New York, N. Y.
Todd, W. W.	Mid-West Rubber Manufacturers Association	Chicago, Ill.
Tompkins, A. G.	Sioux City Tire & Mfg. Co.	New York, N. Y.
Timpany, Julius	A. A. Dainger & Co.	Chicago, Ill.
Viles, A. L.	The Rubber Association of America	New York, N. Y.
Webber, Henry S.	Heyden Chemical Works	St. Louis, Mo.
Wedgewood, Jos. V.	Portage Rubber Co.	Akron, Ohio.
White, W. W.	C. J. Tagliabue Manufacturing Co.	Brooklyn, N. Y.
Whittaker, Wm.	Chas. E. Wood	New York, N. Y.
Wilber, Marshall D.	Palmer Tire & Rubber Co.	St. Joseph, Mich.
Wilson, Chas. T.	Chas. T. Wilson Co., Inc.	New York, N. Y.
Wilson, E. W.	Wilson Tire & Rubber Co.	Springfield, Ill.
Wilson, W. E.	Akron Rubber Mold & Machine Co.	Akron, Ohio.
Wishnick, Robert	A. Baigier & Co.	Chicago, Ill.
Wright, Clarence	Racine Auto Tire Co.	Racine, Wis.
Wrisberg, W. E.	Newsom Valve Co.	St. Louis, Mo.
Wuchter, W. W.	Nebraska Tire & Rubber Co.	Omaha, Neb.

CANADIAN NOTES.

The Mount Royal Rubber Co. opened its new factory building on Messier street, Montreal, Quebec, with an informal housewarming on the evening of December 5, 1919. About eight hundred guests attended, including officials, executives, and employees of the offices, factories and field organizations of Ames Holden McCready, Limited, The Ames Holden Tire Co., Limited, and Ames Holden Felt Co., Limited, as well as of the Mount Royal Company. Dancing followed an informal reception and refreshments were served at midnight on the third floor of the building.

The Goodyear Tire and Rubber Co. of Canada, Limited, according to report, will build a \$75,000 plant in Regina, Saskatchewan, to serve as western headquarters in Canada.

The Brunswick-Balke Collender Co., Hanna avenue, Toronto, Ontario, is reported to have bought a factory site at Woodstock, the same province, where it will construct a new plant to cost \$200,000.

The Imperial Tire Co. is the new name of what was formerly the Imperial Vulcanizing Co., 569 Yonge street, Toronto, Ontario, the change being in name only. This concern is Toronto distributor for the Gates half-sale tire.

Extensive plant increases are being made at the Sherbrooke, Quebec, factory of the Canadian-Connecticut Cotton Mills, Limited, manufacturers of Sea Island, Egyptian, peeler and Arizona cotton fabrics. New funds to the extent of \$5,000,000 have been arranged for and it is understood that some very important and strong connections are identified with the enterprise. With the increased facilities to be in operation in 1920 the plant will have a capacity of 13,000,000 pounds or more of tire fabric. This is considered to be in excess of the consumption of the country, but it is the desire of the company to make ample provision for the future growth of the Dominion. Meanwhile the surplus product will be exported, active preparations for this latter branch of the business already being under way. Provision has also been made for another large extension in 1921.

The offices of the company are at 15 Park Row, New York City, and the officers are: Harry L. Burrage, president; Tracy S. Lewis, treasurer; R. J. Caldwell, chairman; and Obadiah Butler, secretary-treasurer.

CHICLE CONCESSIONS IN CENTRAL AMERICA HAVE LONG BEEN acquired by chewing gum manufacturers. Now comes the acquiring of balata concessions in Venezuela by the English firm of R. & J. Dick, pioneers in gutta percha and balata manufactures. The next step to assure guttas for belting, golf balls, cables and chewing gum will doubtless be the growing of trees or shrubs capable of producing gum plastic somewhere in the Americas.

The Rubber Trade in Great Britain.

By Our Regular Correspondent.

SPREADING ROOM VENTILATION.

BENZOL POISONING, which was referred to recently in this correspondence, has now become of general interest to the proofing trade, not that benzol is likely to be commonly used, but because the Home Office Factory Department is considering whether the stringent rules as to ventilation are to be applicable and compulsory in all cases where solvent naphtha is used. If this comes to pass—and it seems quite likely—it means a good deal of trouble and expense in a matter which many proofers consider does not call for any alteration in procedure. What may be necessary where poisonous dope is used and where fatalities have occurred, is not wanted, they say, in ordinary rubber proofing, the workmen engaged in which can be shown by statistics to be healthy and long lived. Of course, the ventilation in a good many old and cramped spreading rooms might be improved with advantage, but a protest is being raised against the proposed compulsory adoption of the somewhat severe dope regulations.

The scheme is that air previously warmed is to enter the roof or ceiling of the spreading room and be drawn out by a fan near the floor, an arrangement which is intended to insure that the operatives are always breathing air free from naphtha-vapors. Some firms have already been put to considerable expense in arranging matters to meet the factory inspector's present requirements, and others who are enlarging or moving to new premises are in trepidation as to the alterations they may be compelled to make in the near future if greater stringency is decided upon by the powers that be.

It seems to me that the time is not ripe for any general condemnation of solvent naphtha, though there is certainly room for experimental work as to the effects of thorough ventilation upon the health of the workmen—experimental work such as has been carried out in the cases of benzol and dope. Solvent naphtha is not a war-time novelty sprung upon the trade, and the experience of those who have worked with it for half a century should not be lightly put aside by those in authority who have only recently made its acquaintance. It seems likely that one result of the new move will be an increased tendency to consider the representation of the naphtha recovery engineers who, generally speaking, have been preaching in the wilderness.

With regard to the possible future use of benzol in rubber works the matter of price will be an important factor. At present this is controlled by the Benzol Manufacturers Association which is selling a heavy benzol for motor use at about 2 shillings per gallon. This price, however, is now about to come up for consideration at the hands of the Central Profiteering Committee in London and it is possible that some reduction may be brought about.

THE GREENGATE AND IRWELL RUBBER CO., LIMITED.

This company has been formed with a nominal capital of £800,000 to acquire the two private limited companies of I. Frankenburg & Sons and the Irwell and Eastern Rubber Co., both of Salford, Manchester. Frankenburg's is the older company, its chief concern being with the proofing branch, though the manufacture of insulated wire and canvas shoes were added at later dates. The Irwell company, in which I. Frankenburg was also largely interested financially, was concerned solely with mechanical goods and the manufacture of balata belting. James Tinto has been the leading spirit in this company since its inception and now becomes chairman of the new company, the

main reasons for the formation of which are the closing of various trusts held by the late Mr. Frankenburg and the desire to raise additional capital. The land, buildings, plant, etc., are valued at £240,000, independent of the stock in trade, book debts, investments, cash in bank, etc.

The new capital issue to the public is 250,000 7½ per cent preference shares of £1 each, and despite the flood of new issues at the time the prospectus was issued, the response seems to have been most satisfactory. Commentators in the financial columns of the press expressed the view that these shares were a good investment for all classes, being well secured both as to principal and interest. Among the directors of the new company are Sydney Frankenburg, who has been in active service for the duration of the war, and J. Gibson Tinto, son of the chairman.

FUSION OF RUBBER MANUFACTURERS AND GROWERS.

The Federated Rubber Growers & Manufacturers, Limited, is the title of a new company formed by the combination of Wood-Milne, Limited, of Leyland, George Spencer Moulton & Co., Limited, Bradford on Avon, and the Pundul Estates, Limited. The capital is £1,250,000 in ordinary shares of £1. The directors are Alexander Spencer, London, chairman; Frank Turner, Rochdale, vice-chairman; F. Spencer, Ashton Abbotts, Buckinghamshire, and H. B. Potts, Rochdale. The rubber estate showed a net profit of £4,000 for last year. A recent quotation for the shares of the new company was 27s. 6d.

STANDARD TYRE AND RUBBER MANUFACTURERS, LIMITED.

This company has been formed with a share capital of £200,000 to take over from the Chemical Engineering Corporation, Limited, as a going concern, the Alperton Rubber Mills near Wembley, Middlesex. The purchase consideration is £125,000, and in order to provide sufficient capital £60,000 debentures have been issued. The offer to the public was £100,000 ordinary shares of £1 each.

The works management is to be in the capable hands of Mr. Hughes, formerly with the Dunlop company and more recently with the Victor Tyre Company and the Almagam Works, of Harpenden. Mr. Warwick, of the latter company, who was also connected with the Wembley Works when they were controlled by the Chemical Engineering Corporation, Limited, has now no interest in the new company.

FIRES.

In November a fire occurred at the works of G. W. Loughton & Co., Limited, rubber manufacturers, of Craft street, Clayton, Manchester. Another fire of a more serious nature was at the Bank Bridge Works, Limited, near Manchester, the new plant which was due to start work in a week's time and which had cost £10,000 being very considerably affected.

TRADE NOTES.

The motor shows and the motorcycle and cycle shows in London in November seem to have been successful from all points of view, except for the difficulty experienced by visitors in securing hotel accommodation. It will be some time before this state of affairs rights itself, as we all hope it will some day, and for this reason, if for no other, it will come as a relief to many that H. G. Montgomery, upon whom the mantle of the late Staines Manders has fallen, has decided to postpone the next International Rubber Exhibition in London from 1920 to 1921.

The descent of London financiers upon Lancaster for the purpose of buying up cotton mills has naturally caused a great stir, and from the prices that have been paid to the fortunate hold-

ers of shares, it is clear that the cotton requirements of the rubber industry will not be filled at easier prices than now rule for some time to come.

At the time of writing—the end of November—a deadlock exists in the Industrial Council for the rubber trade regarding the demands by the operatives of a further increase in wages. The India Rubber Manufacturers Association has turned a deaf ear to the request, mainly because it does not represent the whole of the trade and is not inclined to agree to terms which would not be binding upon others. The assistance of the Ministry of Labor has been invoked and a conference is to be arranged. The workmen's union, it is said, is desirous that the matter should go to arbitration, but this does not appear to meet with the employers' views.

EUROPEAN NOTES.

THE RUBBER EXHIBITION that was to have been held in London next summer has been put off till 1921. An exhibition of rubber goods from French manufacturers that was planned for the end of November in the rooms of the French Chamber of Commerce in Queen Victoria street was also given up.

British capital set-out 75 per cent of the rubber plantations, of which more than 50 per cent are on territory belonging to Great Britain. Of the estimated 300,000 tons of rubber that plantations will produce, 220,000 will be England's. Some figure on a rubber production of 500,000 tons in 1926.

Fear is expressed in some British circles that Americans will buy up their rubber shares on the Stock Exchange, as they have a 16 per cent advantage over English capital, owing to the fall in exchange.

The Research Association of British Rubber & Tyre Manufacturers may be addressed in care of W. B. Peat & Co., 11 Ironmonger Lane, London, England.

Exports of rubber from London to the United States in the first ten months of 1919 amounted to \$20,822,018 worth; in the same period of 1918 the value of rubber exported was \$3,743,639. In the month of October alone the value of rubber shipped was \$6,958,479, compared with \$4,119,028 in September.

Rubberized fabrics according to British reports are in demand greatly exceeding the supply. It is greatest from France, which is a center for continental trade in the goods, but Holland, Scandinavia and South America, which calls for ponchos, are trying to buy extensively in the British market, and China and Japan are coming in also, especially for light weight cloths and garments. The Australian demand has fallen off, but Canada can do with any amount of British stuff in spite of the competition from the United States.

The London Central Committee under the Profiteering Act has now been formed. Among the large number of names, representative of a variety of manufacturers is that of Alexander Johnstone, of the North British Rubber Co., Limited, representing rubber. He was nominated by the Federation of British Industries, both he and James Sands, of the Irwell & Eastern Rubber Co., Limited, being on the directorate of that Federation.

Hale & Son, brokers in crude rubber, balata, gutta percha and asbestos, 10 Fenchurch avenue, London, England, announce that William Bertie Jenner Horne has been taken into the partnership. Mr. Horne has been associated with this firm for the past fourteen years. The other partners are M. G. Hale, B. S. Ingram, J. M. Vanhouse and M. W. Palmer.

Finland's first factory for making balata belting, the *Finiska Remfabrikan So.* (Suomen Hilmatchdas, O. Y.), founded in 1916, has been able to begin work only recently, as the balata, rubber and gutta percha it had bought in England was held up in Sweden during the war and has only just now been released.

The great Vickers plant at Barron in Furness has been converted to a peace basis and the projectile shop is now turning out machinery, including rubber mixers and calenders.

The plan of standardizing golf-balls is discouraged for the present by "The India-Rubber Journal" on account of the difficulty in changing molds.

Poland requires no import license for raw celluloid, rubber, caoutchouc, and technical manufactured rubber goods.

The union of German surgical hard and soft rubber manufacturers, at a meeting held in Leipzig to regulate prices, on account of the general rise, decided for an increase after November 14, 1919, of 10 per cent on seamless and patented rubber goods and of 25 per cent on hard rubber goods.

The German rubber industry shows a generally satisfactory activity and the manufacture of tires has started up again. Orders, however, can be filled only in part, owing to the deficiency in crude rubber and in coal.

German firms are taking large orders in Denmark for surgical and hygienic rubber goods, hard rubber combs, etc. Owing to the low value of the mark they can compete against English and American manufacturers, but whether they can deliver their goods seems doubtful.

At Fröndenberg on the Ruhr, a factory has been established for the manufacture of automobile tires and rubber goods for export to Russia by the proprietors of the late Prowodnik works at Riga, in connection with the cable works at Fröndenberg. The company is called the "Rhenish-Westfälische Gummi und Gutta Percha Werke, Atlantik," and plans to turn out 2,000 pneumatic tires a day. The Prowodnik works at Riga may be started again with machinery provided by British and French agency.

Italy's consumption of raw rubber increased four-fold in the eight years ended in 1918, when it imported 7,545 metric tons of crude rubber. Turin and Milan are the important centers for the rubber and allied industries, though there are factories also at Genoa, Leghorn and Naples. These employ about 20,000 workmen and produce every kind of rubber article; automobile, motorcycle and bicycle tires are the most important and the output of insulated wire and cables is very large. The Italian company that manufactures insulated wires is about to increase its capital. A recent Royal decree regarding telephone equipment gives the preference first to Italian goods, produced by Italian capital and labor and using native material, and next to foreign firms, established in Italy and producing their goods in that country. Where bids are called for native firms will have a protection of 10 per cent and foreign firms producing in Italy a protection of 5 per cent.

GERMAN RUBBER REGISTRATIONS END—TRADE FACES ECONOMIC DIFFICULTIES.

Special Correspondence.

BY A NOTICE dated September 20, and taking effect September 21, the German Imperial Minister for Industry has officially put an end to the confiscation of and obligation to register crude rubber, gutta percha, balata, reclaimed rubber, asbestos, partly or wholly finished manufactures, and also the prohibitions against producing them.

The German compulsory management of rubber is therefore ended. The Association for the Sale of War Tires will be dissolved at the end of the year. The prohibition of importation of automobile tires still stands on paper; nevertheless, adequate quantities are to be admitted free in so far as German industry cannot meet the demand. Really it ought to be able to meet it since even before the prohibition on production was lifted, both

secretly and more or less openly, large purchases of rubber were made. For that matter the crude rubber situation is merely a question of importation. Much more difficult is the procuring of the necessary textiles and, most serious of all, are the prospects of a coal shortage this winter. The outlook in this respect must be described as very unfavorable. The Continental Rubber & Gutta Percha Co. has been obliged to shut down for a week on account of lack of fuel.

As stated above, the prohibition of automobile tires imports remains in force for the present without its having been able to interfere thus far with the flooding of the German market with foreign tires on the expulsion of rubber manufacturers from the field they had occupied.

All in all the conditions which await the German rubber industry are not precisely rosy. Of crude rubber it will be able to obtain more than enough but at what cost in comparison with values, besides the everlasting strikes, the demands for high wages, the unwillingness to work and the prospect of nearing communistic troubles.

The Hamburg crude rubber market begins to come to life even if the transactions are still very small. Holland can sell much rubber to Germany—if the dealers there will put up with unfavorable terms of payment and credits. Germany has become a poor country and must pay dearly for many sins she has committed. The great mass of the people, however, did not wish for the war and regarded it throughout as a war of defence.

PRESIDENT OF KOBE-OSAKA RUBBER MERCHANTS' ASSOCIATION.

Y. MIYAGAWA, president of the Kobe-Osaka Crude Rubber Merchants' Association, was born on October 23, 1888, in the city of Hiroshima, Japan. His father being a Samurai of high standing, Mr. Miyagawa was brought up in a very strict home.

Later, however, he was converted to the Christian religion and baptized in December, 1904. Having graduated from the Hiroshima Commercial College with honors in March, 1905, he entered the Royal Rubber Works, Kobe, where he learned about rubber goods in general as well as methods of manufacture under Dr. R. Yoshida, one of the greatest rubber authorities in Japan.

In 1910 Mr. Miyagawa was appointed sales manager of the Standard rubber factory, and in September, 1912, was made manager of the Nagoya branch of the Dunlop Rubber Co. (Far East), Limited.

In November, 1913, he decided to go into business for himself and established the firm of Y. Miyagawa & Co., Osaka, importers of crude rubber and exporters of rubber goods. The business prospered, and entrusting this Osaka office to his younger brothers, he started a branch at Kobe, which has since been separated from the Osaka office and is an independent firm at present.

Mr. Miyagawa has visited the Straits Settlements and India, studying rubber market conditions in general. These journeys taught him the need of improving the general conditions under which transactions in crude rubber were being made in Japan, and when the Kobe-Osaka Crude Rubber Merchants' Association was established under his auspices he was appointed president.

He is also a director of the Osaka Rubber Goods Merchants' Association, and is the adviser to the Indian Market Department

of the Dunlop Rubber Co. (Far East), Limited. His wide experience and responsible connections entitle Mr. Miyagawa to be regarded as one of the highest authorities in the Japanese rubber trade.

THE DUTCH ARE UP TO DATE.

Very few are aware of the fact that the Government of Holland exercises an exceedingly careful supervision over the rubber and gutta percha industry in the Netherland East Indies, not in a cursory way, but in the way of scientific testing of all

RUBBER LABORATORY MACHINERY, TECHNICAL COLLEGE, DELFT, HOLLAND.

types of gums, and reports that are of the greatest value to the planters.

The accompanying illustration relates to the experimental rubber plant erected at the technical college at Delft, Holland. It deals with only one portion of the large department devoted to the rubber mill section. Here are found a miniature washer, mixing mill, calender, press and vulcanizer, all of the approved type and capable of handling samples of considerable size. The plant is run electrically, and there is also a self-contained steam generating plant. Connected with this department is an up-to-date laboratory equipped with everything necessary for analysis and testing.

A FREE PORT AT STOCKHOLM.

Sweden, having decided to establish a system of free ports, has made a beginning with one in the harbor of Stockholm, which is now open for business, though far from completion. It may take ten years before the plans prepared are fully carried out. As it is, two steamers can now be sent out at once. By next year piers will have been built which will allow steamers drawing 27 feet to discharge. Stockholm is getting ready to handle most of the goods that are to go to other Baltic ports.

THE NIGERIAN METHOD OF STRIKEBREAKING.

Two months' imprisonment with hard labor is the penalty for West Coast of Africa negroes who refuse to work on Sunday, according to a judgment given recently at Calabar in southern Nigeria. A large Pará rubber plantation started tapping and informed the "boys" who had been trained for the work, that they must work on Sundays, and would receive more pay than the other laborers who did not work on that day. After trying it for one Sunday, a few of them organized a strike, after European methods, induced most of the others not to work, threatened those who were willing, and informed the manager that the men would not tap at all unless he stopped Sunday work. The ringleaders were arrested. The magistrate at once found them guilty and told them he could send them up for two years but, as it was a first offence, gave them only two months.

Y. MIYAGAWA.

Pará Rubber in Mexico—Some Reminiscences.

By J. L. Hermessen, F.R.G.S.

THE SPECIAL CONTRIBUTION in the October number of THE INDIA RUBBER WORLD, under the heading "Rubber in the State of Vera Cruz, Mexico," has suggested to me the possible interest of some notes regarding Pará rubber in Mexico, by reason, particularly, of the mention of the plantation El Palmar, owned by El Palmar Rubber Estates, Limited, of Glasgow, Scotland. This property possesses the distinction of being (or, since its very existence now is questionable, one should perhaps better say, having been) the pioneer in the experimental cultivation of *Hevea brasiliensis* in Mexico. While many others, in the several and often far separated planting districts of the country (in parts of the States of Vera Cruz and Oaxaca, of the Isthmus of Tehuantepec, and of Tabasco and Chiapas on the borders of Guatemala), had made tentative trials with the tree, in no case within the writer's knowledge had plantings of any area been attempted.

Dr. Pehr Olsson-Seffer was quite well known to me before he was connected with El Palmar, but what is about to be related belongs to the period of the late J. C. Harvey's incumbency as manager there; for by him the enterprise was initiated and under his personal direction carried out.

Mr. Harvey had long previously taken a more than plantonic interest in *Hevea brasiliensis*, and in his garden at Buenaventura, where he had formed a splendid collection of tropical flora, both ornamental and economic, he raised a number of specimens from seed procured from Ceylon—in the first instance, I think, direct from the Government Botanical Station at Peradeniya. These, throughout the years of their growth from slender plants into mature trees of tappable age and size, had

Amazon rubber tree, adaptable, as it had seemed in the East, to physiographic conditions differing widely from those of its native habitat. From Buenaventura, under date of April 13, 1913, Mr. Harvey wrote:

I have been spending some three weeks here, sizing up our situation and I think we will go ahead and reconstruct this prop-

HEVEA BRASILIENSIS NURSERY AT EL PALMAR IN 1911.

erty in cacao, coffee and Pará rubber. . . . Pará is a success on wound response. I have been tapping two or three trees daily for a week, and the yield increases from the single paper-like shaving taken off the lower edge of the first and only incision. Academically, I knew all about this but, tool in hand, doing and seeing results is moving, I assure you. A little arithmetic comes in. Say that we cut out two dry months, April and May, we have ten months; deducting Sundays and possibly five feast days—285 tapping days—say 4 grams dry rubber per tree, or 1,140 kilograms per tree for the year. Cut it in two for young trees, and it makes Castillos look pretty sick. No guesswork, but facts that are demonstrable. The authorities in the Orient say that an expert tapper handles 800 to 1,000 trees per day. If he taps only 500 per day it nets 2 kilos dry rubber per man per day at 4 grams per tree, so that our wage rate still leaves a handsome profit at \$1 per pound, United States currency.

A little later (I have no memorandum of the date, but it was almost certainly in the month of May, because it was, as I recall the height of the dry season on the Isthmus of Tehuantepec) I was staying with Mr. Harvey at Buenaventura, and together, for a week, we sallied forth every morning before sunrise, with our tapping paraphernalia, to the ground allotted to *Hevea*. I have to regret the loss, through the vicissitudes of war years, of information upon the results of our operations of which we kept at the time the fullest record. Suffice it to say that they amply confirmed the figures in Mr. Harvey's letter quoted above.

The first planting of *Hevea brasiliensis* at El Palmar, on regular field lines, was done with stumps to the number of several thousand, imported for the purpose from Ceylon. Upon arrival these were put into nurseries, and after they had become acclimatized and generally fairly established they were set out to make their way further under conditions to which they would have to accustom themselves to prove a commercially successful culture. The proportion of plants which survived the preliminary nursery stage was not as good as Mr. Harvey had expected, and he subsequently elected to get *Hevea* seed from Ceylon. This was sown in specially prepared nursery beds, and from the time of germination to that of removal of the plants

HEVEA BRASILIENSIS AT EL PALMAR.

been the object of devoted care and study on his part, eventuating in a series of systematic tapping experiments, the results of which went to strengthen Mr. Harvey's belief in the suitability of certain sections of the country to the introduction of the

to the field they were most carefully tended and guarded against every potential element of danger. Again, unfortunately, details like planting distance, number of trees per acre, etc., are not now available.

In a letter dated Buenaventura, September 26, 1914, which reached me, after a course of some months, at Loja in Ecuador, Mr. Harvey said:

Shufeldt, Clarence and I spent some days last week at El Palmar. Our 50,000 Pará trees are good to look at. Clarence's few trees at San Silverio have cleaned up for the year an average of $\frac{1}{2}$ pound dry rubber per month per tree, which is more than satisfactory. The largest tree at El Palmar, four years from seed, measures $24\frac{1}{2}$ inches in circumference 1 foot above ground. I am going to try the tool on it this December or January. I expect to be in full swing on a few thousand trees two years from December, as measurements made the other day justify this anticipation. The tree you and I measured at Buenaventura years since—then, I think, it was $13\frac{3}{4}$, or $15\frac{1}{2}$ inches—now measures 32 inches in circumference 2 feet above ground.

About a year before (to be precise, in the month of August, 1913), when acting as *locum tenens* on the American-owned estate of San Silverio, Oaxaca, in the absence of the resident superintendent, C. M. Harvey, it fell to me to supervise the setting out of some thousands of Pará seedlings from the nursery. There, too, earlier trial growths of *Hevea* had shown the same encouraging development as at El Palmar and, in consequence, upon the recommendation of J. C. Harvey, who was the consulting expert, a quantity of seed had been obtained from Ceylon and some regular plantings started, comprising, if I recollect rightly, five or ten thousand trees at the time referred to. The *Hevea* seedlings were interplanted with young *Castilloa*, a practice which Mr. Harvey had originally adopted on his own private property of Las Palmas, near Buenaventura, with beneficial effect, he thought, the indigenous tree affording the supposedly more delicate exotic some protection against the unfavorable phenomena of the dry season, characterized as it is on the Isthmus of Tehuantepec by a relentless sun and spells of a riotous hot south wind lasting for days at a time. It is in my memory that these plantings suffered severely from the dietary attentions of deer, who evinced a fine taste for young Pará, and I think that we were ultimately forced to employ some sort of fencing arrangement about the trees.

It is greatly to be deplored that events in Mexico since 1913 should have rendered impossible the task of bringing to fruition these very interesting and valuable planting ventures which, when last seen by the writer, bore every promise of success. It is to be feared that nothing can now remain of them, the region in question (within only a short distance of the important coffee center of Córdoba) having been constantly overrun and plundered by rebel bands.

RUBBER PLANTING NOTES. LOOKING AHEAD IN RUBBER GROWING.

A BRITISH ESTIMATE OF THE FUTURE of rubber production and of rubber consumption by a man in a position to know the facts intimately is sure to attract attention. At a meeting of Harrisons & Crosfield in London on October 27 Mr. George Croll, the chairman, reviewed the rubber situation and compared it with his own forecast made in 1918, before the Rubber Plantations Investment Trust. He then asserted his belief to be that if there had been no war, the consumption of rubber would have been much greater than it was and that he saw no reason why the probable large increase in 1919 could not be absorbed. He thinks there is room for great improvement in rubber statistics, but from a careful examination of the best available his conclusions are as follows:

After making allowance for the accumulation of the 1918 crop, which was exported from the Eastern countries during the first half of 1919, I now estimate the production of plantation rubber for this year at about 320,000 tons, to which 40,000 tons of wild

rubber have to be added, making the worlds production of rubber this year 360,000 tons.

His estimate for the 1920 crop is between 360,000 and 370,000 tons; for the 1921 crop, 381,000 tons; for 1922, 403,000 tons, and for 1923, 430,000 tons.

In regard to consumption he expects the United States to import in 1919 about 220,000 tons; the United Kingdom to make a poor showing with 40,000 tons; France 30,000 tons, Italy 15,000 tons, Canada 10,000 tons, Japan 10,000 tons and the rest of the world 25,000 tons, a total consumption of 350,000 tons out of the 360,000 tons produced. The consumption in 1919 will take care of the production and Mr. Croll thinks that that will be true of 1920 and 1921 also.

British capital owns approximately 80 per cent of the plantation rubber industry, which is far from being the case with the consuming end. From July, 1914, to June, 1915, the United States took 141,000 tons of rubber and the United Kingdom 21,000; in the twelve months from July, 1918, through June, 1919, the United States took 180,000 tons and the United Kingdom only 50,500 tons, and as Great Britain has a large transit trade, a great part of this even was reexported as crude rubber.

AVERAGE YIELD OF HEVEA RUBBER.

The amount of *Hevea* rubber yielded per acre on the average in the various rubber plantation districts of India, Ceylon and the British and Dutch East Indies appears in the Bulletin of the Rubber Growers' Association of South India.

	Average Pounds per Acre.		
	1917.	1916.	1915.
Ceylon.....	312	253	248
South India.....	218	232	187
Johore.....	298	283	328
Negri Sembilan.....	298	283	228
Perak.....	38	367	153
Selangor.....	344	340	331
Straits Settlements.....	247	252	243
Sumatra.....	36	309	405
Java.....	322	303	253
Borneo.....	226	224	170

The highest record in the list was 607 pounds in a Selangor estate in 1917, the lowest 81 pounds in the Straits Settlements in 1916.

CEYLON RUBBER PRODUCTION.

Ceylon in 1918 exported 50,934,460 pounds of rubber, valued at \$22,226,268, as compared with 75,781,401 pounds, valued at \$44,543,785 in 1917; a decrease of one-third in quantity and one-half in value. The exports in 1918 were smaller than in any other year since 1914. This was due partly to the restrictions on the importation of rubber into the United States and to the removal of rubber from the priority list in the United Kingdom and partly to the restriction of the output by the planters. No average price for the year was computed by the Ceylon Chamber of Commerce. The price in 1916 was 58 cents a pound in 1917 it was 48 cents, in August, 1918, it was 20 cents a pound for crepe and 18½ cents a pound for ribbed smoked sheets, while toward the end of the year both were selling for about 38½ cents a pound.

RUBBER CULTURE RESEARCH WORK IN BRITISH INDIA.

Professor J. B. Farmer in "The India-Rubber Journal" discusses the report of Dr. Butler, imperial mycologist of the Department of Agriculture in India, regarding the administration of research work in the British possessions in the Far East. The proposal to unite all agencies for research—government, corporation and private—is thoroughly approved, for in all matters of rubber culture the attempt to retain exclusive information seems short sighted.

Concerning Dr. Butler's projects for a central management for research Professor Farmer is apparently skeptical. The division of responsibility between the government administration, the rubber planters and the scientific experts will be a difficult matter to settle in the East. Professor Farmer suggests that a small scientific committee in London be put in charge.

The Balata Industry in the Colony of Surinam.

By J. Barkley Percival.

PRIOR to 1857 balata was practically unknown, at least to civilized man. The natives of the Guianas are said to have used it for cutlas handles and drinking vessels, but only rarely. In the year mentioned, Professor Bleeknode described it as Surinam gutta percha, which it really is, and not a rubber as so many mistakenly call it.

Exports from Dutch Guiana began in 1881 and were very small—365 pounds. However, by 1911 the product reached some 3,000,000 pounds, increasing almost every year with the single exception of the year 1888, when none was gathered. All told, up to the present time, there has been given to the world fully 30,000,000 pounds of Surinam gutta percha.

The tree from which this valuable gum is obtained is the *Mimusops globosa*, described under eight other names, the commonest of which is Gaertner's *Mimusops balata*. Other names are *Sapota mulleri*, *Mimusops kauki*, which is Linnaeus' name for the tree, *Mimusops dissecta*, *Mimusops hookeri*, *Mimusops ballata*, which is Blume's spelling of Gaertner's title, *Achras balata*, and *Lucuma mamosa*. The Surinam Dutch call it the horse-flesh tree, on account of the appearance of its wood, while the English have corrupted the native "bolletrie" into bullet-tree.

The tree grows to a large size, often attaining a diameter of six feet, has thick, rough bark and reddish wood, as its Dutch name implies. The leaves are glossy, oval and pointed at the tip. The flowers appear in groups surrounded by leaves. The fruit is a berry about the size of a coffee berry, but soft and sweet. The kernel is hard and produces a bitter oil.

Soon after the Dutch Colony began to ship balata, British Guiana and Venezuela entered this field, the three countries named furnishing the bulk of the gum that is marketed.

The tropics furnish scores of different trees yielding a milk which coagulates into a gummy mass, and while the famous "bullet" tree was the foundation of the commercial balata business, and still retains its place as the producer of the best balata, it has never been the sole source of supply. There has been a good deal of "mixing" done in the past, but the laws are so stringent and the collectors so sharp that dishonesty among the bleeders is now almost impossible. Dutch Guiana is remarkably rich in gum-bearing trees so that the temptation is very great to palm off the bastard for the legitimate gum on the market.

Discovery of the varying properties of gum from the different trees has been a gradual matter following the development of commercial balata extraction in Surinam; methods of coagulation are probably as old as the aboriginal use of the gum. That in the Colony has certainly not varied for fifty years, with the

exception of isolated experiments toward improvement.

The milk, caught in mud, leaf or calabash below gashes made with a sharp instrument in the bark, is collected in kerosene tins and then it is taken to the camp where it is poured into shallow trays (debrees) which hold from five to thirty gallons. The milk coagulates in these trays and the balata is taken off in sheets, successive sheets being removed until the trays are empty with the exception of the mother liquid. These sheets

are hung up first over the debrees to drain and then in a roughly constructed shed. When dry they are dispatched to Paramaribo for export to the ultimate market.

There are always tricksters in trade and the balata man is no exception to the rule. Frequently some extremely foreign bodies are found concealed, some perhaps by accident, but the most, however, through intent, in order to make the sheet weigh more. In this way stones, lumps of hard wood and nails have found a temporary resting place between the layers of gum. The laborers are paid according to the amount of balata collected and this, perhaps, is the cause for the temptation of "packing" foreign matter between the sheets.

The yield per tree varies considerably, the flow being affected by changes in meteorological conditions. Trees give at the first tapping an average of one gallon of milk each, equivalent to about five pounds of dry balata. The cuts made in the bleeding of balata are stated to take four or five years before they are entirely healed, and as no tree may be retapped before the incisions are completely healed, that period has to elapse before retapping can be done. Subsequent tappings are said not to yield as

well as the first ones. Accurate records, however, are lacking.

For the purpose of the administration of balata-collecting concessions, the colony is divided into blocks—a more easily accessible northern portion and a less accessible hinterland. These blocks are then granted to companies who pay the taxes yearly in advance to the government and in default to pay the taxes on a certain date, all rights to the lands are forfeited immediately. Applicants must give the Crown Lands officer a satisfactory security that there is sufficient means to operate the concessions thoroughly before they are granted.

No balata tree is allowed to be bled which does not measure 36 inches in girth at four feet from the ground. Trees may be bled on only one-half of their girth at any one time, and no tree can be retapped until the previous incisions are completely healed. For bad work or contravention of the conditions under which the concession is issued the concessionaire is held responsible, but he is empowered to, and expected to prosecute any offending bleeders or employees. The government has appointed forest officers to assist the Crown Land officers in inspecting the

A BALATA BLEEDER AT WORK.

work of the collectors—and with many beneficial results.

The gathering of balata is done by black or colored laborers and these have to be registered before they can be employed. They usually obtain advances of money at the time of registration for the purpose of purchasing their bush outfit, implements, etc. On the site a suitable tract is selected for a camp, and rough leaf-covered huts are put up. The debree—a shallow tray in which the balata milk coagulates—is then built and everything is in preparation for the collection of the latex. The balata bleeder now proceeds to locate the exact position of the trees nearest at hand, and makes his plans for collecting. The trees are tested with a small cut in order to ascertain in what condition they are for operating upon, and from these initial cuts an experienced bleeder can readily ascertain which trees will most quickly repay tapping.

During the present year the price of balata made marked variations. At the beginning of the year it was up to four florins¹ the kilogram,² but in August it was down to nearly half that figure in the local market. Meanwhile the rival balata from private lands is also bringing about two florins the kilogram in the city market, and a crop of nearly 50,000 kilos is predicted.

In spite of this competition, which has for the last four years dictated prices in the local markets, the balata from concessions maintains its favored position on account of its purity and excellence.

The most spectacular feature in the prices of balata is that for the years 1909-12, during which the article brought unheard of prices. These were the days when the balata merchant—not the collector—found his hands full of money. He could sell balata and make a profit at an average price of one florin¹ and fifty cents the kilo, while the world's market offered about seven guilders³ and fifty cents for each kilogram. This golden shower, following upon other periods of high prices in the early 'nineties and remoter times acted on the balata merchant in a manner that convinced him firmly that good times were the normal thing; that if periods of bad luck came they would pass in the future as they had passed in other years, and that, in fact, "something always comes along to help the Surinamer" in spite of crude methods of collection, unsystematized economic methods, enormous export duties and all the other difficulties against which Dutch Guiana balata has to struggle. Although the colony of Dutch Guiana has produced large quantities of balata since the inception of the industry, there are yet unheard of quantities awaiting exploitation with the advent of capital, which will certainly come along sometime in the near future.

It may be interesting to describe the life of the average balata bleeder. He gets up in the morning—that is rolls out of his hammock—at four o'clock, and lantern in hand, for it is dark until six, sets out with his cutlas (machete) for gashing the trees, or for clearing the paths on his round of tapping. He gashes each tree hastily, fixing a calabash below each wound, visiting each one of his hundred trees and returning by the outer path to his hut, where his woman, if he has one, has prepared his

coffee. More generally he is alone, and in that case he proceeds to light his fire and drip his own coffee.

Later in the morning he must make a second round if the milk is not to coagulate in the calabashes. He takes his kerosene tin and tips the contents of each calabash into it, carefully inverting the calabash on a bit of stick at the tree's foot. When he returns he has perhaps three or four liters of milk, which must now be coagulated in the debrees.

A bleeder often walks from six to ten miles a day, for distances between each of his trees may be long ones; there are 80 non-balata trees to each balata in the average Guianese forest. He works from four in the morning until sundown, or more or less than 14 hours a day; small wonder if he keeps Saints' days now and again, or spends a merry week-end drinking rum.

It is said to be good work if the bleeder can make 50 liters in two weeks; he is more likely to take a month. When he completes one of the sheets, he takes it to the foreman, who is in the same position as the "grubstaker" of early California gold mining days, and who is remarkably lucky if he comes out with any amount of money in hand at the end of a season. Sometimes he does, and is then likely to arrive in Paramaribo with more guilders than his accustomed pockets can conveniently hold, and proceeds to get rid of his pile in a week or two. There are exceptions, where the collector goes back with savings made in the city, and the proprietor naturally gets the best of the business of this season.

In too many cases the collector has neither rioted nor saved at the end of a season's work; he has been charged a comparatively tremendous sum for each scant item of food and equipment. It is more easy than reasonable to blame the concessionaire for this high price; he has had in his turn to pay high for imported goods from the United States and he is taking the risk of the balata collectors failing to make good, whether from incompetence or sickness. These are not healthy regions, and many men become incapacitated or die in the forests; their successors pay their debt to the company, albeit unconsciously.

It is calculated that there are at least 10,000 men engaged in the balata collecting business in Surinam; they work on an average only 160 days in the year, produce in that time about 800 pounds of balata which is drawn from 150 to 200 trees. Some experts in the business say that the bleeder could, if he chose, work eight months in the year instead of less than six which is more common, but one of the main attractions of the life is that the collector of balata is able to work when he pleases, lay off for a day or two, have a good time when he feels inclined and can go home to see his family when, if ever, he saves up enough money. His rewards are, however, so largely discounted by the inflated prices which he pays for the miserable supply of food on which he supports life that it is remarkable that this industry is as well fed with labor as it is. Nothing but the hope of easy money, which has come at times of high balata prices—a lure akin to that of the gold mine—takes men into the Surinam forests.

One suggested remedy for the exorbitant values placed upon food-stuffs is that the state should provide commissary stations

TANK FOR COAGULATING BALATA.

¹One florin equals \$0.402 United States currency.

²One kilogram equals 2.2 pounds.

³One guilder equals \$0.40 United States currency.

where supplies could be bought at reasonable prices; such a system, honestly carried out, would perhaps help to put economics on a better footing, but so far the idea remains an idea.

Many advanced countries hold fast to their faith in untaxed exports. It is a doctrine with much to recommend it, especially

tons against 887 tons in 1917, 765 tons in 1916, and 210 tons in 1915. The small output of last year is mainly due to the scarcity of labor; the best bleeders migrated to French Guiana where inducements were better than in the colony and where the workers are not so much controlled. A very large crop is anticipated for the present year, however, owing to the fact that there has been a rush of men from Demerara since the armistice was signed. Local restrictions having been partly removed, it is fair to say that balata will resume its former position as an important industry the moment conditions return to normal.

For five long years the balata boys experienced very hard times; they worked under some most difficult circumstances; the great scarcity of American foodstuffs on the one hand, and the uncertainty of receiving their wages on the other (owing to the world's struggle, which cut off the colony practically from the outside) were causes of great dissatisfaction amongst them. Now the worst is past and there is daily evidence of renewed interest to enter into contracts and be once more cheerfully earning their daily bread.

TRINIDAD RUBBER CULTURE.

Rubber in the island of Trinidad is still in the experimental stage though the Report of the Department of Agriculture of Trinidad and Tobago for 1918 says that it continues to expand. The exports were 39,517 pounds, nearly double the 22,224 pounds of 1917. On one estate 16,000 *Hevea* trees were tapped; on some scrap was made from *Castilloa* but many *Castilloa* trees have been cut down because the yield was less than had been expected. The report regrets the experimentation.

Hevea is apparently the best rubber tree for the colony; it flourishes not only in the moist districts but in places that were thought too dry for cocoa. Trees at St. Clair yielded an average of 2½ to 2¾ pounds in the last seven years when the average rainfall was only 56½ inches. Interesting experiments in tapping are reported and no leaf disease or other disease or pest has appeared so far.

THE ROOT SYSTEM OF HEVEA.

At the *Horto Florestal* of the *Seringal Miry*, the experiment station in the State of Amazonas of the Rubber Tree Club of Manaus, an interesting investigation has been made of the root system of *Hevea brasiliensis*, as shown in the illustration.

The trees in the grove are seven years old and planted thirteen feet apart. The roots on one-quarter of the circumference have

ON THE MARONI RIVER.

perhaps in the case of manufacturers, but it is one which the South American countries cannot yet afford to follow. The state revenues are thus maintained, and balata has been the favorite milch cow of the authorities. It has paid in the past, and still is paying one-third of its official value in various export duties. Almost without exception those interested in the industry think that export taxes must be reduced; that they must in fact be reduced to meet conditions of the present day, if the industry is to last.

It must not be supposed that a decline or even the extinction of the balata industry in Dutch Guiana would mean the ruin of the colony. The threat of declination has rather done good in forcing the attention of industrialists to other fields than that of the collection of the latex of the balata tree. During 1917 there occurred a stimulation for agricultural pursuits, and several thousands of acres were cultivated with rice and other cereals and food roots, while the cattle industry received more serious consideration. There are vast uplands of pasture country which will be valorized when the world becomes more fully aware of the rapid contraction of cattle feeding grounds in other regions.

There have been, however, some important changes made during this year. In April the Balata Company Suriname acquired for a respectable amount the rights held by Brown & Co. on certain blocks, and it is rumored that the Consolidated Balata & Rubber Estates operating in British Guiana will soon take over for a good round figure some of the principal concessions held by local concerns. With the arrival of fresh capital and new blood it is expected that the industry will be placed on a still more firm and lasting basis.

The exports from the colony during the year 1918 were 663

("A Seringueira.")
ONE QUARTER OF THE ROOT SYSTEM OF A HEVEA BRASILIENSIS, EXTENDING TWENTY-SIX FEET FROM THE TRUNK.

been uncovered here for a distance of over twenty-six feet from the trunk. The picture demonstrates graphically to what extent the rubber trees call on the soil for nutriment and is evidence of the necessity of wide planting.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED NOVEMBER 4, 1919.

- 1,320,293. Traction pen. E. M. Houston, Minneapolis, Minn., and W. A. Houston, Sioux City, Iowa.
1,320,404. Self-inflating tires. I. A. Mohn, Red Wing, Minn.
1,320,417. Heel with rubber section. G. C. Seymour, New York City.
1,320,513. Rubber brush for washing bottles. C. K. Volkening, Brooklyn, N. Y.
1,320,518. Tire, multi-chamber type. O. Zancan, New York City.
1,320,540. Swimming apparatus with pneumatic cushion. F. Fedzyan, New York City.
1,320,596. Blotter with sponge rubber body. Shizutaro Aoki, Shimokyo Ku, Kioto, assignor to Takeji Tokuhisa, Tokio—both in Japan.
1,320,617. Bead anchorage for cord tires. C. G. Hoover, assignor to The Goodyear Tire & Rubber Co.—both of Akron, O.
1,320,648. Pessary. H. M. Potter, Bloomville, N. Y.
1,320,675. Platoon packing of rubber-impregnated fabric. G. Christenson, Jamaica, assignor to H. W. Jolus-Manville Co., New York City, both in New York City.
1,320,708. Tire liner. M. Pianko, Chicago, Ill.
1,320,737. Suspensory bandage. A. R. Chisholm, New York City.
1,320,900. Respirator. F. E. McKesson, Toledo, O.
1,320,935. Gas mask. N. Schwartz, New York City.

ISSUED NOVEMBER 11, 1919.

- 1,321,188. Self-lifting fountain pen. H. Catucci, assignor to Mabie, Todd & Co.—both of New York City.
1,321,206. Wheeled toy with propeller operated by rubber band. G. B. Hansburg and E. M. Lyons—both of New York City.
1,321,220. Tire with inner tube composed of rubber, sponge rubber, and fabric. E. H. Layman, Pacific Beach, Jersey City, N. J.
1,321,265. Appliance for telephone receiver. J. M. Wagner, assignor by direct and mesne assignments to W. L. McKay—both of Chicago, Ill.
1,321,266. Stethoscope. A. H. Wilkinson, Jacksonville, Fla.
1,321,301. Pneumatic cushion. W. A. Gibbons, Flushing, N. Y., assignor to the Rubber Regenerating Co., Naugatuck, Conn.
1,321,403. Pneumatic cord tire. B. L. Stowe, Jersey City, N. J., assignor to Morgan & Wright, Detroit, Mich.
1,321,451. Rubber-dam clamp with multiple jaw. J. W. Ivory, Philadelphia, Pa.
1,321,452. Rubber-dam punch. J. W. Ivory, Philadelphia, Pa.
1,321,466. Tire with circumferential rib extended within and vulcanized to body portion to form air spaces. A. J. Meyer, Chicago, Ill.
1,321,545. Resilient wheel with pressure-exerting members of rubber. C. A. O'Neill, assignor to Demountable Spring Tire Co., New York City.
1,321,556. Pneumatic tire. J. K. Ross, Chicago, Ill.
1,321,565. Reinforced tire. T. J. White, New York City, Pa.
1,321,719. Wheel rim structure composed of sections with vulcanizable facing on tread part, a vulcanizable tread band, etc.
W. C. Chrysler, Chicago, Ill. (Original application divided.)
1,321,791. Tire valve. E. E. Holt, Chicago, Ill.

ISSUED NOVEMBER 18, 1919.

- 1,321,833. Inflator and tester for toy balloons. O. G. Lyon, Akron, O.
1,321,879. Tire with rubber core. S. J. Barton, Chicago, Ill.
1,321,188. Demountable rim for tires. G. J. Clayton, Lakewood, N. J.
1,322,018. Corset with elastic inserts. J. L. Holt, Portland, Ore.
1,322,067. Transmission belt of rubberized fabric with leather ends. A. A. Somerville, Flushing, assignor to New York Belting & Packing Co., New York City—both in New York.
1,322,095. Collapsible rim for tires. C. B. Deeds, Savannah, Ill., assignor by mesne assignments to Lightning Change Rim Corp., Berrien Springs, Mich.
1,322,096. Collapsible rim for tires. C. B. Deeds, Savannah, Ill., assignor by mesne assignments to Lightning Change Rim Corp., Berrien Springs, Mich.
1,322,202. Curved woven puttee with elastic threads increasing in diameter from edge to edge. J. M. Roche, New York City.
1,322,276. Catamenial napkin with elastic straps. A. Wolff, New York City.
1,322,281. Sectional elastic tire filler. F. L. Bailey and J. H. La Grant, Wichita, Kans.
1,322,285. Cushion heel. I. E. Bremberg, Chicago, Ill.
1,322,321. Armored pneumatic tire. J. M. Belleville, N. J.

ISSUED NOVEMBER 25, 1919.

- 1,322,520. Demountable rim for tires. R. S. Bryant, assignor by mesne assignments to The Standard Parts Co.—both of Cleveland, O.
1,322,550. Tire interliner composed of metallic wool and graphite between layers of asbestos. T. V. Edmunds, Winston-Salem, N. C., assignor of $\frac{1}{2}$ to R. G. Parker.
1,322,583. Tire valve. H. P. Kraft, Ridgewood, N. Y.
1,322,608. Cushion tire. H. N. Palmer, Grovelandville, Mass.
1,322,636. Puncture-proof tire. D. W. Skogsborg, Chicago, Ill.
1,322,639. Shovel. C. H. Snider and L. D. Magrath, Conway, S. C.
1,322,685. Wheel with rim composed of cylindrical units shiftable to bring new bearing face into position, etc. J. A. Franklin, Pittsburgh, Pa.
1,322,706. Massage machine. Glenn S. Noble, Chicago, Ill.
1,322,734. Flexible, inflatable, heat-resistant rubber article for use in heat-curing vulcanized rubber tires. H. E. Smith, Cleveland Heights, O.
1,322,735. Armored tire. F. H. Van Lozen, Cleveland, O.
1,322,777. Pneumatic tire. M. C. Frank, Piedmont, assignor of $\frac{1}{2}$ to N. Le Vene, San Francisco—both in California.
1,322,782. Pressure gauge for tires. B. G. Gillochio, Los Angeles, Calif.
1,322,786. Lifesaver. W. Marshall, assignor to W. B. Roscher, assignor of $\frac{1}{2}$ to J. Westcott, Ocean City—both in New Jersey.

- 1,322,828. Life-saving device for use at sea. G. Salaman, London, Eng.
1,322,836. Garment supporter. E. M. Silverman, assignor to Harris Suspender Co., a partnership composed of E. M. and H. W. Silverman—all of New York City.
1,322,862. Wrist fountain pen. I. Zuroff, New York City.
1,322,884. Pressure gage for tires. E. Edelmann, Chicago, Ill., assignor to A. Schrader's Son, Inc., New York City.
1,322,905. Dust cap for tire valve. F. L. Just, Syracuse, N. Y.
1,322,984. Ice bag. P. R. Wesley, assignor to Davol Rubber Co.—both of Providence, R. I.
1,323,060. Resilient wheel. E. Jacquemin and J. Kucharek, Brussels, Belgium. (Renewed.)
1,323,079. Pneumatic tire. J. J. Luck, San Antonio, Tex.
1,323,160. Elastic tire with soft rubber core and pneumatic tube. A. A. Crozier, London, Eng.
1,323,181. Anesthetic apparatus. W. V. Goodfellow, Los Angeles, Calif.
1,323,193. Traction ring for pneumatic and other cushion-tired wheels. G. Cambert, St. Paul, Minn.
1,323,217. Ventilating mask for patients. G. E. Darrow, San Francisco, Calif.

THE DOMINION OF CANADA.

ISSUED NOVEMBER 4, 1919.

- 193,571. Non-slipping rubber heel. B. W. Brockett, Cleveland Heights, O., U. S. A.
193,606. Solid tire. E. J. Hahn, Merrill, Ia., U. S. A.
193,640. Fastener for rubber heels. F. A. Nolan, St. Paul, Minn., U. S. A.
193,646. Heel pad. S. Schulhoff, Trenton, N. J., U. S. A.

ISSUED NOVEMBER 11, 1919.

- 193,736. Metatarsal arch support. L. Adair, Toronto, Ont.
193,778. Inner tube. J. E. Henderson, Toronto, Ont.
193,802. Rubber heel. F. A. Nolan, St. Paul, Minn., U. S. A.
193,810. Rubber stamp of the band type. F. Pittman, East Kent, Victoria, Australia.
193,831. Rubber-foam foot-pedal for automobiles. J. B. Stewart, Winnipeg, Man.

ISSUED NOVEMBER 18, 1919.

- 193,932. Demountable rim for tires. B. E. Braught, Cartwright, N. D., U. S. A.
193,971. Fountain pen. L. L. Gugel, Berea, Ky., U. S. A.
193,984. Pneumatic tire. E. F. Jones, Epsom, Auckland, N. Z.
193,988. Semi-circular solid rubber tire with metallic tread. J. F. Loughran, Chesham, U. S. A.
194,005. Gas mask. G. A. Mickelson, Vancouver, B. C.
194,019. Pneumatic tire. D. C. Roberts, Trenton, N. J., U. S. A.
194,051. Reinforced tire. W. W. Yarnert, Sycamore, O., U. S. A.
194,073. Felthelmed rubber boot. The Canadian Consolidated Rubber Co., Limited, Montreal, Que., assignee of F. Sage, Hastings, Minn., U. S. A.
194,102. Sectional tire. M. G. Bunnell, Decatur, and T. R. Whempley, Chicago, assignee of a $\frac{1}{2}$ interest—both in Illinois, U. S. A.
194,107. Skirt being with rubber lining. J. E. Gledits, D. Basch, New York City, assignee of M. L. Basch, Brooklyn—both in New York, U. S. A.
194,114. Tire. J. M. Gilbert, New York City, assignee of F. B. Carlisle, Davisville, R. I., U. S. A.

ISSUED NOVEMBER 25, 1919.

- 194,072. Airplane structural element coated with hard rubber, etc. The Canadian Consolidated Rubber Co., Limited, Montreal, Que., assignee of W. A. Gibbons, Flushing, L. I., N. Y., U. S. A.
194,180. Pneumatic suspension. A. Joey, Zurich, Switzerland.
194,189. Rubber-coated catgut for ratchet strapping. S. G. Lewis, Greensburg, Pa., U. S. A.
194,235. Reinforced tire. W. W. Yarnert, Athens, Ga., U. S. A.

THE UNITED KINGDOM.

ISSUED NOVEMBER 5, 1919.

- 132,099. Child's overall, with elastic inserted in hem. A. A. Fuller, 34 Upper Tollymore Park, Finsbury Park, London.
132,109. Rubber stops, pads, buffers, etc., for door-stops, walking sticks, etc.
132,110. Heel pad. J. Leach, 212 Upper Thames street, London.
132,181. Arch support. W. H. Robson and A. Powell, 7 New Oxford street, London.
132,204. Rubber soles for boots. W. J. Wicks, 244 Hoxton street, Hoxton, London.
132,206. Dating stamp, band type. W. T. Brassington, 29 Hockley street, Birmingham.
132,211. Iron fields. Louisa W. (F. Kellar, 208 Chancellor street, Philadelphia, Pa., U. S. A.).
132,378. Resilient blades for supporting billiard table cushions, with or without layers of sheet rubber between layers of wood. F. A. Alecock, 155 Elizabeth street, Melbourne, Victoria, Australia.
132,444. Revolving rubber heel. W. H. Barnes, 27 Great Ancoats street, Manchester, and H. Vaudrey, Sandiway House, Altrincham, Cheshire.
132,502. Inflatable cushion for insertion between inner and outer soles of boots. G. E. C. Gerber, 36 rue des Chausseurs, Clermont-Ferrand, Puy de Dome, France.

ISSUED NOVEMBER 12, 1919.

- 132,570. Bifurcated, rubber-sheathed clip for attaching electric cables to balloons or kite cables, etc. E. G. Cleverly, Royal Air Forces, Ruxhampton, London.

- 132,582. Collapsible and folding boat of waterproof material, having inflatable side chambers. A. E. Ford, 42 North Audley street, London.
- 132,645. Fabric designed for outer covers of pneumatic tires, made of textile and rubber covered wires. N. I. Lipman, 125 Euston Road, London.
- 132,675. Ironing machine with rubber pad on lower board. L. W. Gould, 5 Corporation street, Birmingham. (American Laundry Machinery Co., Norwood Station, Cincinnati, O., U. S. A.)
- 132,692. Composite beam, 216 New York Life Building, St. Paul, Minn., U. S. A.
- 132,746. Squirrel for washing windows. W. E. Moser, 11 Western Road, Merton Abbey, London.
- 132,760. Adjustable rubber protector for soles of boots and shoes. W. J. Wicks, 244 Hoxton street, Hoxton, London. (Refers to Specification No. 132,722 above.)

ISSUED NOVEMBER 10, 1919.

- 132,902. Brushes for shaving, etc., made from strips of rubber slit to form bristles, some of which are perforated. H. Tomlinson, 5 George street, Hedon, Yorkshire.
- 132,927. Anklet of artificial feet, with rubber buffers. C. E. Hadlow, 88 Mortimer Road, Kensal Rise, London, and Pedestros, Limited, 1 Higham Road, Chesham, Buckinghamshire.
- 132,935. Non-slipping rubber block for end of walking stick, crutches, etc. T. Akerman, Mountcombe, Sarbton, Surrey.
- 132,946. Pads for cleaning windows, held in place by rubber bands. W. B. Rife, 9 Wyndham Road, Wallasey Village, Wallasey, Cheshire.
- 132,950. Bubble-blowing toy fitted with rubber tube and bulb. H. H. Griffiths, 8 Princess Road, Edgbaston, Birmingham.
- 132,962. Hand shields for cycles, etc. M. E. Parker, Ashley House, Galgate, Lancaster.

ISSUED NOVEMBER 26, 1919.

- 133,058. Rubber stoppers reinforced with insertion of metal, glass, etc. L. Goldmeister, 29 West 35th street, New York City, U. S. A. (Not yet accepted.)
- 133,112. Kite balloon with funnel-shaped air inlet leading to ballonet and fitted with flap valve, etc. E. C. R. Marks, 57 Lincoln's Inn Fields, London.
- 133,215. Pad for end of crutch, etc. R. L. G. Marx, 3 Clifford street, 1144 East Market street, Akron, O., U. S. A.)

NEW ZEALAND.

ISSUED OCTOBER 16, 1919.

- 40,850. Splint rim for tires. W. W. McRae, Waikari, North Canterbury, N. Z.

ISSUED OCTOBER 30, 1919.

- 41,860. Artificial foot and leg connected by piece of rubber forming ankle joint. J. Wyllie, Kershaw's Engineering Works, Nelson, N. Z.

TRADE MARKS.

THE UNITED STATES.

- No. 106,167. The word **SOCO**—rubber erasers, etc., Spokane Office Supply Co., Spokane, Wash.
- 111,951. The representation of a kangaroo sitting within a tire—rubber and fabric tires and rubber inner tubes. Quick Tire Service, Inc., New York City.
- 113,146. The letters **I S C** and rubber insoles. Peterson-Franzen & Co., Chicago, Ill.
- 113,194. The word **WONFICE**—rubber button bases, etc. Kabo Corset Co., Chicago, Ill.
- 113,751. The word **CAREY**—packings of asbestos, rubber, textiles, etc. The Philip Carey Manufacturing Co., Lockland, O.
- 114,571. The word **EWARD**—tire retreading and stapling machines, etc. Remort Manufacturing Co., Oakfield, Wis.
- 114,584. The word **MASON** inside an oval—rubber and fabric or rubber composition tires and tubes. The Mason Tire & Rubber Co., Kent, O.
- 114,876. Representation of bust of a **YVING** and the letters **YVING** within the letter **V**, all superimposed on a tire—rubber tires. The Combination Rubber Manufacturing Co., Bloomfield, N. J.
- 115,259. The word **DURNAN** between parallel lines of stenciled dashes—stitched and impregnated canvas belting. The Rossendale Reddaway Belting & Hose Co., Newark, N. J.
- 116,127. The word **CRESCENT** within a crescent—fountain pens. The Conklin Pen Manufacturing Co., Toledo, O.
- 116,141. The word **SHALER** within a conventionalized rectangle—vulcanizers. C. A. Shaler Co., Waynes, Wis.
- 116,668. The word **FLEMO**—rubber tires, etc., Chicago, Ill.
- 117,449. The word **VADACOL** on a scroll—rubber tires. The Dry Climate Tire Manufacturing Co., Arvada, Colo.
- 117,904. Representation of bust of a **PUGLIT** within a tire, both behind the word **RESISTO** within a rectangle—suspenders, belts, garters, etc. Joseph Silberman, Baltimore, Md.
- 118,041. The word **IMPERIAL**—mechanical rubber goods. Boston Belting Corp., Boston, Mass.
- 118,108. The words **PARA BOND** within a shaded circle—tire patches. Emco Manufacturing Co., Inc., Stengalton, N. Y.
- 118,447. Representation of a label bearing a circle, a reindeer within concentric circles, and corner ornaments—elastic webs. W. Preston & Son, Limited, Leicester, England.
- 118,448. The word **RACINE**—rubber and fabric tires. Racine Rubber Co., Racine, Wis.
- 118,532. The words **DRI-PEN** within a diamond—rubber, fabric, leather and combination shoes, boots, slippers, and weltings, William Walker & Sons, Limited, Bolton, England.
- 118,631. The words **AMERICAN AERON** so combined that the **A** and **N** form the first and last letters of both words—pneumatic and rubber tires, inner tubes, patches, reinforcers, tire boots and flaps, pneumatic rubber bags for making repairs, valve pads and retread bands. The American Rubber and Tire Co., Akron, O.
- 119,226. The words **MASTER RID**—inner tubes. Essex Rubber Co., Trenton, N. J.

- 119,487. The words **"LET THE TREE BREATHE"**—tire-ventilating valves. Thomas Golden McEwen, Belleville, N. J.
- 119,508. The words **FOAMITE FIREFOAM** arranged over one another so that the letter **F** bears the words—hand-operated portable and stationary fire extinguishers. Foamite Firefoam Co., New York City.
- 119,746. The words **WOMAN**—rubber tires and tubes. The National Tire & Rubber Co., East Palestine, O.
- 119,829. The words **GOODYEAR TRIANGLE** weekly house organ. The Goodyear Tire & Rubber Co., Akron, O.
- 120,052. The words **DOR BOY**—rubber heels. Granger Vacuum Rubber Heel Co., Cleveland, O.
- 120,077. The words **RESISTO**—fountain pens. A. A. Waterman & Co., Chicago, Ill.
- 120,137. The word **TREX**—tire-removing tools. Trexler Rim Compressor Co., Philadelphia, Pa.
- 120,228. The word **GRIP**—rubber tires. The Uzdol Tire & Rim Co., Cleveland, O.
- 120,453. The words **TOM BROWN**—rubber and leather shoes, etc. Filene's Sons Co., Boston, Mass.
- 120,477. The word **KORONA** within a double-outlined diamond—inner tubes, tires, and rubber packing. Corona Rubber Reclaiming Co., Philadelphia, Pa.
- 120,731. The word **CHERUB**—waterproof diaper covers. The Warner Bros. Co., Bridgeport, Conn.
- 121,101. The words **AM-ER-NAT**—rubber boots and shoes, etc., American-National Shoe & Leather Corp., New York City.
- 121,104. Representation of an Indian's head, the words **AM-ER-NAT**, within the outline of an arrow-head—rubber boots and shoes, etc., American-National Shoe & Leather Corp., New York City.
- 121,151. Representation of a girl's head with a piece of chewing gum held between the lips and the words **"GERS I"** above the head—chewing gum. David Miller, New York City.
- 121,377. The word **SACO-BUFFERS**, etc. J. G. Assay Co., Inc., Philadelphia, Pa.
- 121,481. The words **DRI-BOY**—raincoats. New York Mackintosh Clothing Co., Manamontek, N. Y.
- 121,482. The words **DRI-GIRL**—raincoats. New York Mackintosh Clothing Co., Manamontek, N. Y.
- 121,606. The words **ANTI-PYRE**—chewing Gum. George W. Todd, Omaha, Neb.

THE DOMINION OF CANADA.

- 25,326. The word **CONDENSITE**—phenol-methylene liquid, semi-solid and solid plastic compounds. Condensite Co. of America, Bloomfield, N. J., U. S. A.
- 25,344. Representation of Mephisto head on background formed by the letters **"AB"**—insulated cables, etc. American Bosch Magneto Corp., Brighton, Springfield, Mass., U. S. A.
- 25,357. Representation of a boot—rubber soles or pads for heels. The St. Helens Cable & Rubber Works, Limited, The Electric Cable & Rubber Works, Bank Quay, Warrington, Lancaster, England.

will be subject to whatever modification the said regulations may prescribe.

Application for registration at Shanghai must still be made through the American consulate-general, and, to avoid delay and exchange complications, should, in every case, be accompanied by a remittance of Mexican \$7.50, payable to the commissioner of customs, Shanghai.—"The Official Gazette."

COTTON NOTES.

SUCCESSFUL PLANTING IN BELGIAN CONGO.

THE SYSTEMATIC ENDEAVOR to introduce the cultivation of cotton into the Belgian Congo seems to have succeeded. In 1912 the matter was put in charge of an American cotton specialist named Fisher, whose first experiments in the Lower Congo region failed because of irregular rains. In 1915 Nyangwe, a region in Manyema, where the climate is more settled and rain is more abundant, was planted to the extent of 55 acres, which were increased to about 3,600 acres by 1919.

Satisfactory results were also obtained in the Sankurke and Kassai regions, where about as many more acres are under cultivation, which means a yield of 600 or 700 tons of cotton. The Welle region, where the climate is suitable and the natives are industrious, will be tried next. American ginning machinery has been imported and has been set up at Kimbombo and Lusambo, the collecting points. The Congo cotton sold in Liverpool has been graded as middling and good middling. The first lots of Congo cotton that reached Antwerp after the armistice sold well; the latest cargo brought 5,900 piculs, or \$11.40 a ton.

COLOMBIA COTTON.

Cotton raising is neglected in Colombia, although what is grown under unfavorable circumstances is very fine, and of long staple. It is planted without previous preparation of the soil except cutting down and burning off the brush; weeds are

FEE FOR TEMPORARY FILING OF TRADE-MARKS AND PATENTS IN CHINA.

In accordance with instructions from the inspector-general of Chinese customs, a fee of Haikwan taels 5.00 will, from August 1, 1919, be charged for each trade-mark or patent filed for provisional registration at the branch office of the trade-marks bureau at Shanghai.

When fees are remitted by persons living in foreign countries, Mexican \$7.50 will be accepted as the equivalent of Haikwan taels 5.00. This fee will be payable until the regulations for the registration of trade-marks and patents come into force, when it

chopped out with machetes. It needs to be replanted only once in five years and the yield is about 400 pounds an acre the first year and 800 pounds an acre after that.

In 1914 Colombian cotton sold for 24 cents in Liverpool; the output was 789,390 pounds. In 1917 Colombian cotton worth \$23,777 was shipped to the United States. At present not enough is raised to supply the local demand and cotton has to be imported.

COTTON SINCE THE WAR.

Comparisons between the cotton crop of the United States in 1914 and in 1918, show a decline in acreage and production but an increase in value. In 1914 the number of acres planted was 36,832,000, which produced 16,135,000 bales of cotton, valued on the plantation at \$549,036,000; in 1918 the acres were 35,890,000, bearing 11,700,000 bales, valued at \$1,616,207,000. The price of cotton at the plantation on December 1 was 6.8 cents per pound in 1914; in 1918 it was 27.6 cents per pound.

EGYPTIAN COTTON CROP 1919-1920.

The Egyptian cotton crop for 1919-1920 is estimated at 6,000,000 cantars of 99 pounds, or 5,940,000 pounds, according to Consul Garrels of Alexandria. The crop for the financial year ended August 31, 1919, was 5,927,460 cantars, of which 443,000 cantars remained on hand on that date. The exports, in Egyptian bales of 750 pounds, amounted to 718,309 bales, of which 459,744 bales went to England, 95,262 to the United States, 78,487 to France, 49,328 to Italy, 22,160 to Japan, 10,436 to Spain, 2,602 to Greece and Syria, 250 to Portugal and 10 bales to the Dutch East Indies.

Review of the Crude Rubber Market.

NEW YORK.

THE CRUDE RUBBER MARKET has shown a slow but steady advance throughout the month and was very firm in the last week of December so that the year ends with prices at the highest point they have shown in some months. While the demand continues, the steadiness is due in large part to the firm handling of the Singapore and London markets. The excessive stock in the East, if it existed, has not been poured upon the market; the American demand, which was put at 300,000 tons or more, will be met by the importation of not more than 250,000 tons for 1919.

Prices for plantation and South American rubber at the beginning and toward the close of the month are shown in the following quotations:

PLANTATIONS. DECEMBER 2, first latex crepe, spot 53 cents, futures 53 $\frac{3}{4}$ ¢. DECEMBER 31, spot 54 $\frac{1}{4}$ ¢@55 cents, futures 55 cents. JULY-DECEMBER, 55 $\frac{1}{4}$ ¢ cents.

THE MARKET FOR COMMERCIAL PAPERS.

In regard to the financial situation, Albert B. Rees, broker, in crude rubber and commercial paper, No. 68 William street, New York City, advises as follows:

"The demand for commercial paper during December has been very limited, and almost entirely from out-of-town banks, the best rubber names being taken at 6 per cent to 6½ per cent, and those not so well known 6½ per cent, rates being very firm the last half of the month."

SINGAPORE RUBBER REPORT.

GUTHRIE & CO., LIMITED, Singapore, report [November 6, 1919]: The usual weekly rubber auctions which opened on Wednesday were marked by a good demand for all grades which continued throughout the sales. Fine pale crepe sold at up to 97 cents, showing an advance on last week of 1½ cents. Ribbed smoked sheet realized up to 97½ cents or 1 cent better than last auction.

The principal feature of the sales was the demand for lower grades (particularly tan broken cups) which were 2 to 3 cents up on the week. Out of 1,072 tons catalogued 918 tons were offered and 683 tons sold.

FEDERATED MALAY STATES RUBBER EXPORTS.

It is reported by official report from Kuala Lumpur states that the exports of plantation rubber from the Federated Malay States in the month of October amounted to 8,351 tons, compared with 9,841 tons in September and 5,901 tons in the corresponding month of last year. The total exports for ten months of the present year were 85,205 tons, against 64,643 tons in 1918 and 65,927 tons in 1917. Appended are the comparative statistics:

	1917.	1918.	1919.
January.....tons	5,995	7,588	7,163
February.....	7,250	6,820	10,809

Totals.....	65,927	64,043	88,205

STRAITS SETTLEMENTS RUBBER EXPORTS.

An official report from Singapore states that the export of plantation rubber from the Strait Settlement ports in the month of October as 8,338 tons as against 10,476 tons in September and 3,560 tons in the corresponding month last year. The total exports for ten months of the present year aggregate 118,290 tons, compared with 54,876 tons in 1918 and 61,034 tons for the corresponding period in 1917. Appended are the comparative statistics:

	1917.	1918.	1919.

BATAVIA RUBBER MARKET.

HERMANS, MARSMAN & CO., Batavia, report [September 18-October 15, 1919]:

The market opened with small demand for first crepe and smoked sheets and more demand for the lower grades. During the month under review the tone of the market was rather steady, although only a little business was done. The market closed firm with a fair demand for all grades, especially for prompt deliveries. The quotations are:

	In Batavia Per ½ kilo. ¹ Guilders.	Equivalent Per ½ kilo in U. S. Currency.
First pale crepe.....	1.33	\$0.532
First pale crepe.....	1.32	0.528
Prime smoked sheets.....	1.32½	0.530

¹Quoted per ½ kilo (1.1 pounds) in Dutch Indian guilders (\$0.40).

ANTWERP RUBBER MARKET.

GRISAR & CO., Antwerp, report [December 12, 1919]:

The market for the past three weeks has been very steady, with slightly rising prices. Dealings have been larger and the African rubbers, which had been neglected hitherto, are again attracting serious interest. The sales last week amounted to 224 tons, and the stock on hand in the port of Antwerp was about 925 tons. Some of the prices obtained were: Congo Kasai red 3.50 francs to 5.50 francs per kilogram, according to quality; upper Congo Kutanga, 5 francs; upper Congo ordinary red, 4.80 francs; upper Congo ordinary black, 6 francs; upper Congo equator, 5.25 francs. The Congo plantation Hevea rubber fetched 9.70 francs for smoked sheets, and 9.10 for biscuits.

AMSTERDAM RUBBER REPORT.

JOOSTEN & JANSSEN, Amsterdam, report [December 12, 1919]:

The still decreasing rate of exchange of the £ had an unfavorable influence on the market and the tendency was consequently dull and very quiet.

During this week the turnover and demand were small, and through the London market closed somewhat firmer, this has not affected the Amsterdam quotations, and buyers are not inclined to pay more than f. 1.35 for spot standard crepe.

The turnover on the terminal market was very small.

THE MARKET FOR RUBBER SCRAP.

NEW YORK.

THE RUBBER SCRAP MARKET continues inactive. There is only moderate demand for stock on the part of the reclaiming industry and a marked tendency to hold off in purchases until after the usual inventory period is passed.

The prices for shoes are steady without movement of the goods.

The same is true of automobile tires, which are sought actively only on the part of tire rebuilding concerns and those preparing pulled fabric for manufacturers of tire refiners, tire boots and tire repair men for patching purposes.

Dealers view with some concern the London prediction that the output of crude rubber for 1920 will be much increased over that of the past year, in anticipation that such a condition will influence unfavorably the demand for reclaim and consequently for scrap.

THE MARKET FOR COTTON AND OTHER FABRICS.

NEW YORK.

AMERICAN COTTON. On December 1, the spot price for middling uplands cotton stood at 39.45 cents; it fluctuated above that price for a week or so, reaching 40.25 cents, the high mark for the month, then dropped to 38 cents, where it stayed for a few days. December 17 saw it rise again to 39.25, a price which was maintained for fully two weeks to the end of the year, without change and with a daily record of "no sales."

EGYPTIAN COTTON. The market dropped sharply from the high prices reached at the beginning of November and is now quiet but strong. No upper Egyptian is left and low-grade Sakellarides is also scarce so that purchases of Egyptian, practically, will be limited to medium and high-grade Sakellarides, which are quoted at 85 to 90 cents.

AMERICAN-EGYPTIAN COTTON. Arizona cotton also dropped in sympathy with Egyptian. Early frosts followed by rain stopped growth so that the cotton was coming in ranks only as choice. The crop estimate is much reduced and 40,000 bales may be too high. Arizona-Egyptian is quoted at 80 to 85 cents.

SEA ISLAND COTTON. The situation is unchanged. Very little high-grade exists, buying though steady is slow and the price quoted for average extra choice is 84 cents.

TIRE FABRICS. The manufacturers of tire fabrics are working hard to meet the demands of the customers with whom they have made contracts. It is useless to quote prices because fabrics are not to be had save possibly for an occasional small lot.

DUCKS AND DRILLS. Owing to the continued labor troubles, there is a scarcity of supply which cannot be remedied, however keen the demand, until the mill hands settle down to working full time again. The inactivity of the mills has checked the need for some lines of goods, such as belting duck, and dealers are awaiting the return of normal conditions.

One cantar equals 98 pounds.

One feddan equals 1.1 acres.

(Compiled by Davies, Benachi & Co.)

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.
NEW YORK.

THERE IS GENERALLY a short supply of all leading rubber compounding ingredients. The market is firm and there appears to be no prospect of lower prices after the first of the year. Everything, on the contrary, tends to higher manufacturing costs. In some directions there is curtailment of production and limited supplies regardless of prices.

ANILINE OIL. There is no spot stock and prices have advanced. **DAKTES.** Prices are very firm because of the inability to get stocks forward and the danger of the short coal supply as well as the continued lack of labor.

BENZOL. The demand is very active with 34 cents the price for spot goods.

LITHARGE. The price has advanced a cent during the past month, but the demand continues to far exceed the producing capacity of the makers.

LITHOPONE. Contracts for the early months of 1920 have been placed at 7 1/2 to 7 3/4 cents. Prices are exceedingly firm.

LIME. Makers report that they are several hundred tons behind in production and have found it necessary to discard certain productions of lime in order to take care of the heavy orders on the more essential grades.

SUBLIMED LEAD. In spite of the heavy and increasing demand prices have not been advanced.

SULPHUR. The market is firm and steady and prices reasonable.

WHITING. Owing to the difficulties of securing adequate supplies of English chalk the situation was relieved somewhat during December by arrival of chalk from Danish sources. Supplies are still short owing to slow arrivals of material.

NEW YORK QUOTATIONS.

DECEMBER 29, 1919.

Prices subject to change without notice.

PAN AMERICAN SOCIETY DINNER.

The Secretary of the Treasury as president of the United States section of the International High Commission has accepted the offer of the Pan American Society to give a dinner in New York to the foreign delegates to the Second Pan American Financial Conference.

This dinner, which will conclude the official program of the conference, will take place at the Waldorf-Astoria at 7 p. m., Monday, January 27, 1920. Prominent rubber men on the dinner committee include E. H. Huxley, William S. Kies and Frank A. Vanderlip.

Vol. 61 JANUARY 1, 1920.

THE TROPICAL AGRICULTURIST and Journal of the Ceylon Agricultural Society

The Tropical Agriculturist (fully illustrated) is now an official publication with special scientific papers in addition to many of its old features.

Edited by R. N. LYNNE, F. L. S., F. R. G. S.
Director of Agriculture, Ceylon.

Rubber Cultivation and the Chemistry of Rubber form one of the features of the Journal; full information on Ceylon and Malay Peninsula methods and progress. All about Tea, Coffee, Cocoa, Tobacco, Cinchona, Cinnamon, Fibre Plants, Coconuts and other Palms, Citronella, Lemon Grass and Essential Oil Grasses, and all tropical products.

Rate of Subscription for America, including postage:

Yearly.....In advance \$5.00

The Tropical Agriculturist circulates throughout the world, especially in the Tropics, and is a first class advertising medium.

SUBSCRIPTION: \$3.00 per year, \$1.75 for six months, postpaid, for the United States and dependencies and Mexico. To the Dominion of Canada and all other countries, \$3.50 (or equivalent funds) per year, postpaid.

ADVERTISING: Rates will be made known on application.

REMITTANCES: Should always be made by bank draft. Post Office or Express money order on New York, payable to THE INDIA RUBBER PUBLISHING COMPANY. Remittances for foreign subscriptions should be sent by International Postal Order, payable as above.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

TABLE OF CONTENTS ON LAST PAGE OF READING.**AS TO STRIKES AND UNREST.**

THERE NEVER WAS A TIME in the memory of man when so much thought was put upon industrial conditions as at the present. Pamphlets by the ton are sent broadcast, by Government, by banks, by individuals. Profit sharing, shop parliaments, workmen's councils, pension plans, beneficent legislation, are but a few of the panaceas earnestly advocated. Most, if not all of them, have been tried, and more during the past year than in any previous year. And the number of labor rows has been the greatest yet. It is only fair to say, however, that the benefits above enumerated were not responsible for the labor unrest. That was largely a war aftermath.

There should be some sane basis upon which industries could be run which would obviate unrest and strikes. As we ponder the subject, it occurs to us that the Standard Oil Company, of all the big corporations, does not seem to be strike stricken. If that is so, what is the secret? John D. Rockefeller, Jr., who speaks wisely and well, recently said:

"The Community's right to representation in the control of industry and in the shaping of industrial policies is similar to that of the other parties" (namely, Capital, Management, and Labor). "Were it not for the Community's contribution, in maintaining law and order, in providing agencies of transportation and communication, in furnishing systems of money and credit and in rendering other services—all involving enormous outlays—the operation of Capital, Management and Labor would be enormously hampered, if not rendered well nigh impossible.

"The Community, furthermore, is the consumer of the product of industry, and the money which it pays for the product reimburses Capital for its advances, and ultimately provides the wages, salaries and profits that are distributed among the other parties."

That is good talk, even if gasoline is high. But exactly how does the S O C O deal with the walking delegate and the agent of the Soviet? Is it not possible that the industrial giants who founded the greatest of American enterprises have solved the problem and are perhaps themselves unaware of it?

THE RUBBER CORED GOLF BALL.

TALK OF STANDARDIZING GOLF BALLS, and even of a return to the solid gutta ball is in the air. It is all because of the far flying rubber cored ball. From the day of its advent it very much upset oldtime golfers. That a Yankee should produce a ball that made the "gut-tie" seem like a lump of inert dough was unbelievable. And that this golfing world should accept it with prompt enthusiasm was almost criminal.

So the rulers in golfdom ponder and plot to stay the long flights and to get back to the ancient one hundred and fifty yard drive. Of course it cannot be done. Professional, amateur and dub yearn for distance. If a half-mile ball appears it will be eagerly bought and universally used.

Standardization spells the end of experiment and the death of progress. Better "bide a wee."

RUBBER MACHINERY TRIUMPHS.

FROM THE BEGINNING of rubber manufacture, in the forties, the machinery was of the simplest, washers, mixers and calenders, together with churns and spreaders and for curing, dry heaters, steam vulcanizers, and presses comprised the usual equipment. From time to time some minor machine, usually borrowed from some other industry, was installed and its presence kept secret as long as possible. For years the only notable change was in the line of improvement of existing machines. This resulted in huge washers and mixers, mammoth calenders, gigantic presses and a great variety of spreaders. To be sure, an occasional invention appeared as in the sole cutting, hose making, and ball making machines.

The industry, however, continued one in which most of the work of making up was done by hand. The knife, die, roller and stitcher reigned supreme. For decades no notable machine appeared that in any way altered the solution.

With the sudden demand for tires, however, another spirit was almost at once evident. Greatly increased production was only to be reached by the help of machinery. Machines, therefore, began to appear.

In 1909 the records show 20 new machines produced for rubber use and in the following ten years the production gradually increased until 200 new machines appeared in 1919. These, as would be expected, were chiefly for use in tire manufacture.

At the same time, however, the impetus given to one branch of the industry was reflected in the others, and in shoes, druggists' sundries and mechanical goods new processes and new machines came into being.

This growth in mechanics is not only phenomenal but is one of the surest indications of the stability of the business. It assures, more than anything else, its ability to compete with all comers. All of the valuable machines will without doubt be copied and used. But the ability to create cannot be copied nor counterfeited and therein lies the key to continual success.

CRIPPLE CREEK RUBBER.

TEN YEARS AGO Dr. J. C. Ross discovered in the low-grade gold ore of Cripple Creek a product "that was high-grade caoutchouc." This is so because he said it and the press of the country affirmed it. Even after wasting a half score of years to welcome "Cripple Creek rubber" we do not say the learned Ross was a falsifier or that he was even mistaken. We, however, venture to point out that the gold mine operators who claim that excessive labor costs are likely to close their mines, may be overlooking a valuable product. Why not mine the rubber and sell the gold as a by-product?

RUBBER STEALING STOPPED.

ONE OF THE LEAST KNOWN ACCOMPLISHMENTS of the Treasury Department and one for which rubber manufacturers cannot be too grateful was the campaign to break up the gangs that subsisted by the systematic looting of freight from cars in the yards and in transit. It is a disgraceful fact that shippers had most to fear from railroad employees who helped themselves liberally to goods entrusted to their care. The losses paid by the railroads amounted to \$120,000,000 in four years, half of which was due to the railroad men's pilferings. Crude rubber was a favorite article of loot, being easily disposed of and almost impossible to identify. A law passed by Congress, called the Carlin bill, providing heavy penalties for thefts of this nature did but little good.

When the Government took charge of the railroads it took to itself the task of rounding up and punishing the thieves. More than 1,000 freight car thieves were arrested, over 500 were convicted, and 250 received prison sentences. Judges on the bench showed no mercy to this class of offenders, and for the first time in years rubber in transit was safe. This is not, however, an argument for government ownership.

PLANTING FOR PLASTICS.

GUM ELASTIC, once a wild product, is now one of the most successful plantation products. Gum plastic, in other words gutta percha, still continues almost wholly a product of the wild. This, too, in spite of the constantly increasing commercial uses and abnormally high prices. The great gutta producers, the Sapotads, are trees of slow growth, found only in the real tropics. Capital could not probably be secured to plant the *Dichopsis*, the *Minusops* or the *Achras Sapota*.

There are, however, many shrubs in the tropics, subtropics, and in the temperate zones that carry plastic gums. Is not an examination of all of them about due? Further, is it not perfectly possible that taken under cultivation some of them might add notably to the world's supply of gum plastic?

CHEWING CHICLE.

THE CHEWING GUM HABIT, in spite of the efforts of the fastidious, grows apace. The American troops carried it to England and France where it seems to be established. Now it is moving Westward, so much so that a big factory is to be established on the Pacific Coast. Soon it will move on to the Orient. Nor is this to be too much regretted. There are worse habits. Tobacco or betel nut chewing are more offensive. Moreover athletes and aviators say gum is helpful, physicians say it cures gout and dyspepsia, and (this has not been verified) it is said that the Cockney Englishman with a wad of gum in his mouth does no longer drop his h's.

PNEUMATIC VS. SOLID TRUCK TIRES.

IT IS BECOMING MORE AND MORE EVIDENT that the pneumatic tire is likely to oust the solid on the heavy truck, just as it did on light vehicles. The first cost is naturally heavy, and punctures unavoidable, but the saving more than offsets both of these items. Twice as much speed is possible without injury either to engine or freight, and the weight of the chassis can safely be reduced nearly one half. Big trucks are equipped with "giant pneumatics" to-day. One wonders if in time these huge tires will be pigmies compared with the tires of the future.

Twentieth Annual Dinner of The Rubber Association of America, Inc.

WITH 1,000 MEMBERS AND GUESTS PRESENT, AN EXQUISITE MENU, three prominent speakers, and excellent music, the dinner at the Waldorf Astoria on the evening of January 3, 1929, was a distinct success.

Despite the prevailing drought, this being the first dry banquet in the history of the association, there was no lack of enthusiasm. Indeed, all present made light of the matter, the speakers capitalized the situation and several humorous allusions to the advent of national prohibition created considerable merriment.

Prior to the dinner the members and their guests assembled informally in the various reception rooms, renewing old acquaintances and making new ones. Upon the opening of the grand ball-room doors the banqueters took their allotted places in the beautifully decorated hall to the tune of a spirited march by the orchestra. On account of the greatly increased attendance the main floor proved inadequate and twenty-five tables had to be placed in the first tier boxes. Each guest was provided with a tasteful souvenir program and menu bearing the seal of the association.

During the banquet popular selections by the orchestra lent added zest to the choice viands, and after the diners had done full justice to the final course the assemblage was called to order by the toastmaster, Homer E. Sawyer. Meanwhile the balconies had filled with ladies come to witness the animated scene and to hear the speeches.

After a standing toast to the President of the United States had been drunk to the air of "The Star Spangled Banner," the toastmaster gracefully waived the more or less customary presidential address in order more speedily to present the distinguished guests of the evening. He had prepared an elaborate address on industrial relations, he explained, but Mr. Schwab had very kindly offered to take it off his hands. However, as president of the association, Mr. Sawyer bespoke the gratitude of its members in behalf of the Traffic, Statistical, Legislative, Foreign trade and Divisional Committees, whose good work in connection with the standardization and conservation which were undertaken during the war will be of equal benefit in peace times. He also complimented Mr. De Lissner and the Dinner Committee upon the complete success of their arrangements for the evening.

SENATOR EDGE'S ADDRESS.

Honorable Walter E. Edge, United States Senator from Trenton, New Jersey, spoke on reconstruction policies. Referring to the dilatory tactics of the Senate, and asserting that this country is practically waiting on Congress, his address was in part as follows:

Emerging from a war but a little over a year ago so successfully, with the plaudits of all the nations of the world, the admiration and the respect even of our enemies, the entire world speaking of America's part with pride and appreciation—to-day, successful in war, we have not demonstrated the same ability to be successful in times of peace. Business has been hesitating, conditions have been uncertain—continued strife between capital and labor, and all the difficulties, apparently, before us, are yet in great part to be solved.

GOVERNMENT MUST COOPERATE WITH BUSINESS

The question is, what is the solution? Fundamentally, my view of the solution—and I will pass over the question very rapidly—fundamentally my view of the solution is simply this: that the government of a nation just as the government of a state, should not enter into a business, but should cooperate with business. A government that has plainly demonstrated that it cannot run its own business successfully, cannot run the business that has been run by the business world. The only thing the Government can do in my judgment to bring the Government of the country—just as we tried in a modest way to do in New Jersey—to bring the Government where the people may have control of it, is to take advantage of the Constitution—and it is a mighty liberal document—and to cooperate with business; regulate business where it is necessary—do not overregulate it—but choose the great powers of the Government and the great powers that are centralized there and have them encourage business and initiate an enterprise and energy that in the past has made the country great and has given us the position that we occupy to-day among the countries of the world.

SENATOR WALTER E. EDGE.

PROSPERITY REQUIRES A LARGE FOREIGN BUSINESS.

I have been somewhat interested in a modest way to try to help solve some of these problems, in seeing if it were not possible to pass legislation to enable us to do a larger business abroad. You are interested in exportation. You will have to be interested in exportation if your business is going to develop. We have built a magnificent merchant marine, and you have at your table tonight the one man who is mainly responsible for the making of a businesslike merchant marine.

What in the name of heaven is the good of a merchant marine if we are going to send it abroad filled with ballast? We have got to send it abroad filled with American goods and products, or the merchant marine might just as well be scrapped in Hog Island or Cramp's, or some of the other shipyards of the country.

We can't exist in this country to-day—we occupy a position at the head of the council table of all the nations of the world, we occupy it and it is up to us to keep it—we can't exist in this country to-day simply manufacturing goods and selling goods to ourselves. I have absolutely no patience with the thought and the idea that there should be an embargo on American products—at times perhaps on some specific food supply or another, yes—but as a general policy or proposition that there should be an embargo on American products, far from it. The way this country is going to prosper and continue to broaden and hold the position that it has gained is by doing business with all the countries of the world and by using the merchant marine that Mr. Schwab and his associates brought together, so that the American flag will go to every port in every part of the world—the only way that the country can possibly prosper.

BANKING FACILITIES MUST BE ENLARGED.

And we are met with this condition: that we can't send goods abroad unless we are going to be paid for them. We are still business men. We have a good lot of humanitarian feeling and we demonstrated that, and I hope we shall always have it, and we are ready to help rehabilitate Europe, but at the same time it must be a business proposition. We can't to-day send your rubber goods abroad unless we give one or two or three years' credit, as a rule, that is, in big supplies. We have the goods. They have only securities. We have the goods. We have the ships. We want to do business with them. Then the natural

The Rubber Association Banquet.

TWENTIETH ANNUAL DINNER OF THE RUBBER ASSOCIATION OF AMERICA, INC., AT THE WALDORF-ASTORIA, NEW YORK CITY, JANUARY 5, 1921.

question was, "How can those - to use the popular term - various conditions be functioned?" Simply by enlarging the American banking system, just as we establish a bank here or in a small town or a large town to-day and do a domestic business and develop the business there; enlarge our banking system so that we can do business with them. They are doing it in England and they are taking the South American trade, and they are going to beat us right to it unless we get busy. Somebody ought to take advantage of the world's great opportunities. It is the natural evolution from the great World War.

INTERNATIONAL TRADE BANKS.

We passed a bill providing that we can now establish, under the Federal Reserve, trade banks for international banking. What do they do? The man abroad wants to buy \$100,000 of your products. He has not got the money. He has a mortgage that he can give you or something else which perhaps he can give you. He has got security. You cannot take it over. We have provided, however, a banking system so they can take those securities after investigating them, issuing on those securities bonds and debentures to the American public, giving you your cash. Off go the goods, and we are doing business all the time.

RATE OF EXCHANGE NOW PROHIBITORY.

What else does it do? To-day the rate of exchange, as you all know, if you are at all interested in export business, is absolutely prohibitory. In France they have to pay two to one. A franc worth 20 cents is ten cents. In England a pound sterling was never so low as in the last month or six weeks. They have to pay 25 per cent off the normal. Don't live in a fool's paradise.

They are buying now simply the goods they have to have. They won't pay any such tremendous premium as the present rate of interest makes necessary because they won't have to do it.

We have simply got to arrange over here so that we can equalize trade balances or credit balances in order that the rate of exchange will naturally decrease, so that normal times, at least comparatively, can come back in the near future. And when we establish these banks and take these securities from abroad and bring them over here and send the goods over, then we are gradually building up—just the same as imports would build up—so that the trade credit balances gradually equalize and the rate of exchange automatically goes down. That is one of the natural advantages of dealing in foreign securities.

THREE WAYS TO EQUALIZE EXCHANGE.

There are only three ways that I ever heard about by which you can equalize exchange or trade conditions; one is by the importation of goods, another is by the importation of gold, and the other is by purchasing securities. We are now trying to arrange so that we can purchase their securities—they haven't any gold to speak of. Imports we want as we want them, but the main thing is to buy their securities and to send our goods over and for the American business man to make a profit on the goods and to use Mr. Schwab's merchant marine as a practical proposition, rather than simply a sentiment.

The Government now has provided the way and the method. And I believe that in the countries abroad, if the Government will continue to cooperate and hold business, rather than to run business—we can retain the position that the world apparently is ready to adopt to us.

IMPORTANCE OF PEACE TREATY RATIFICATION.

Touching with approval upon the recent activities of the Department of Justice in dealing with some of the diseases now infecting the country, and offering "Export, Import and Deport" as a timely text for the nation, he passed on to the need of ratifying the peace treaty:

Speaking personally, I hope that Congress expeditiously, and without unnecessary partisan rancor or playing for position, gets clear of the peace treaty and ratifies it. As a Republican I have stood, however, and will continue to stand, for the following position: when the Constitution was adopted—we had nothing to do with it—it charged and delegated to the United States Senate certain responsibilities. It is not empty; it means something or we should abdicate our position. I believe and stand for very positively—as I hope my record has testified—that we must protect beyond any question of future doubt the independence and sovereignty of our own country. But in doing that—and that can be done very easily—we should not evade any responsibility in times of peace as we have not evaded any in times of war.

WOULD END BUSINESS HESITATION.

I think much of this business hesitation will be behind us and men will go forward with a determination and an energy that has been just a little lacking in the last twelve months because of uncertainty as to what would happen in Washington. I believe it will go forward with renewed vigor, and perhaps the vacation of a year won't be so bad for us after all, if Congress will decide, if the Senate will ratify the treaty, properly reserved, so that there can be no question of the honor and integrity of our country when it comes to future crises or future decisions to make; that they will dispose of it, and thus send the message out to the industrial section of the country, which means practically all parts of the country: that then it is up to the business men of the country to get busy.

National prosperity depends absolutely on national contentment. National contentment depends to a great extent on employment, and employment, of course, depends to a great extent on the demand for production. You can't increase production unless you have the market. You can't increase production if you narrow the market. That is the reason I am so interested in the exportations, the development of exportations.

FOREIGN CREDITS THROUGH TRADE PROFITS.

We loaned nine billions of dollars during the time of war abroad, and we should have loaned it. We now are not even getting our interest. Perhaps we will. I hope so. I am forgetting it. But we are asked to extend more credit. Isn't it better to develop our own export business and send the goods abroad and make a profit on them, than to receive more money only by taxation? That is the only way we can raise it—in order to lend it abroad. In one way we tax you to lend the money. In the other way you make a profit and we do business. That is the difference between the two systems. I hope Congress recognizes that, and I believe they will. I do not want to be too critical of Congress. They have great responsibilities facing them to-day in the relationship between Congress and the business of the country. We ask for your cooperation, we ask for your advice, and above all, we ask for your confidence.

MR. SCHWAB'S ADDRESS.

In presenting the chairman of the board, Bethlehem Steel Corp., New York, who, spoke on the tendencies and the future of American industry, its opportunities, needs and duties, the toastmaster very aptly and eloquently introduced him in these words:

A general of industry, who rose from the ranks; an exponent of the square deal for labor, capital and the republic; a notable example of the opportunity that America offers to those of her citizens who use and develop the gifts that God has given them; a dreamer of great things, but not visionary; a leader of men,

CHARLES M. SCHWAB.

of a great type of the men who have made the foundation of our country in the past and embody our hope for the future; a typical American; the Theodore Roosevelt of our industry, Charles M. Schwab.

Mr. Schwab spoke in part as follows:

ECONOMY FUNDAMENTAL TO EVERY INDUSTRY.

When I thought of what I might say to this body of gentlemen engaged in the rubber industry, the thought came back to me that, after all, the fundamentals of all industry are alike. Industry is founded for permanent success upon one great condition, and that is economy. I wonder how many of you think of that point? Years ago, as a younger man, and perhaps more ambitious, I used to go to Mr. Carnegie, as president of his company, with the proud statement that we had made four, five or six hundred thousand. Wise old gentleman that he was, he would shake his head, saying, "That interests me not, but show me how cheaply and how well you made it."

Because the conditions of business may make a great profit for you even though the business is badly conducted. But let the economy of production and its distribution be right and the country for all time shares the success of her industry.

ENCOURAGEMENT OF LABOR ESSENTIAL.

Now, gentlemen, what was applicable to that great company is applicable to this great country to-day. It is true that we must take measures suited to the times to aid and help industry. But the one thing that will stand us always to the good is to say of our industries that no matter what the conditions or times, or what is the condition of trade here, our industry will be permanently established for this country and for the world.

Now, what does economy mean? I wonder if you have ever analyzed it? There is nothing that lends value to any manufactured article but labor. You may say that in the manufacture of tires or in the manufacture of steel, labor is but 20 or 25 per cent of the cost, but you go back to the man who finds the rubber on the rivers of Brazil, or the man who digs the iron ore in the fields of Minnesota, or the railroads that carry the ore to the places of manufacture, and all of these agencies that carry things to the final crucible of manufacture, and all of it is nothing more than labor. There is no real cost in a manufactured article but labor. Now then, what is the question that will enable us to become permanently the best interested in economy? It is the management and the disposition and the encouragement of labor. We manufacturers of this country have been great autocrats in the years gone by so far as labor is concerned. Labor has not had its fair share of the prosperity of this great and glorious country of ours. And it is a thought that must be borne home as we stop and listen and realize that a man is a man no matter what his position in life as long as he does his duty honestly and conscientiously and for the good of his country and his fellow-men.

LAWs NEEDED TO PROMOTE SHIPPING.

Replying to Senator Edge's remarks regarding America's hastily built fleet of merchant ships, Mr. Schwab said:

I want to say a word about this great merchant marine that our distinguished senator has spoken about. I want to tell you what my thoughts about it are. This merchant marine that has been built by the United States, true to the traditions of the United States, and that he has so eloquently described, has cost about three or four times what any merchant marine ought to have cost, but we have got to charge it all off as an incident of the war and start in afresh again.

Now, you can dot the seas of the world with the merchant ships of the United States and you won't have a merchant marine without the soul and inspiration and the capital of the American

business men to make it go. The merchant marine will be of value to every manufacturer and every citizen of the United States. And if laws of the United States cannot be passed to make private capital profitable in business—in the shipping business—then the whole people of the United States in some manner ought to share the burden for the benefit of the United States. The Senate and the Congress shy at the word "subsidy." Well, call it by any other name, but as matters now stand the United States will never have a merchant marine worthy of the name merchant marine, or of the slightest value to this country, unless some method of legislation is passed that will enable private capital and private enterprise to reap the profits and reap the benefit from the operation of its merchant ships.

This is the time when it is popular to decry capital. It is a great mistake, if the initiative and energy of the American business man is not allowed to have his reward for that development of industry. We may be called a material nation because we have not developed the arts and the sciences as the older nations of Europe have. I am proud of the fact that I am a citizen of a so-called material nation. Artists, painters, great soldiers, great generals and great admirals may like their names perpetuated in monuments and arches of marble and granite; for me, I shall be proudest if long rows of smoking stacks and flaming furnaces shall mark one step forward in the progress of industry.

BUSINESS AND LIVING ECONOMY NECESSARY.

Fundamentally, we must learn economy, not only in our business, but in our every act. We are living, to use a vulgar expression throughout the whole country to-day, like "drunken sailors," practicing extravagances such as have never been known in any time. Gentlemen we will reap the reward of that expenditure in the years to come by paying the penalty for the dance that we have had to-day. There is no good in preaching that we must practice economy. It will have no effect. It must be brought about by the stern necessities that will make us get down to the basis of living and acting economy that will bring us to a true manufacturing basis in this country. What a false position many men have in life who think that the acquisition of riches and the display of riches marks them as factors in men's affairs! The day has gone by when they will mark the man of benefit to his country and his fellow-men in that way. We must learn to live the simple life.

A GREAT CRISIS WOULD BE BENEFICIAL.

My friends, do not aspire to anything but successful conduct of that which you have undertaken. Accept the assurance of a man who has seen many phases of life. There is nothing worth while but the contemplation of successful accomplishment of the purpose for which you set out to do. Build up industries and make them successful. Make this great nation of ours stand permanently in the position which she has won in this great war. The Almighty has endowed us with natural resources second to no other nation in the world and above all with the people so imbued with patriotism, integrity and energetic ambition as to insure our success as the leader of nations for all time to come. Let us do our part. I believe that we will get to a true basis of economy only after some great crisis that may come upon us to make us realize what the true basis of economy is. The best man in business and in life is the man who has had to go through some crisis before he becomes truly and permanently grounded and fixed in the future success of his life, and what is true of men will be true of nations. We will go through it, and it is so well illustrated by the material on which your industry is founded, rubber; its chief characteristic is its elasticity. You can stretch it ten or twelve fold and it will come back to its original form, and so this great nation of ours; you may stretch it to its breaking point; you may stretch it ten to twelve fold, but the energy of its people will bring it back to the original

LIEUT.-GENERAL ROBERT L. BULLARD.

form that the Creator of all nations has destined that we shall occupy.

AMERICAN INDUSTRY TO PROSPER.

In concluding I want to draw one optimistic word, and that is, in my opinion, that whatever the crisis may be, it will be but temporary.

The industry of this country will go onward and upward for years to come, and in no industry do I think there will be such marked progress as the industry in which you gentlemen here are to-day engaged.

Feel optimistic, think optimistic, be optimistic, practice Christian Science in business and you will have the success that you merit. Treat your labor well. Make them partners with you. Allow them to have representation amongst their own forces. Do not permit the agitator from Kamchaika to tell you what to do with your labor in Worcester, Massachusetts. Do these things. Be fair. Treat all well. Then happiness and prosperity in your business is sure to follow.

GENERAL BULLARD'S ADDRESS.

Stating that to the surprise of the American people the war had shown that the officers in the United States army were not only educated men and fighters brave and chivalrous, but executives of able administrative capacity as well, the toastmaster sketched briefly their remarkable accomplishment of putting an effective army of enormous size into the field in record time, and introduced Lieutenant-General Robert L. Bullard, Commanding Officer, Department of the East, Governor's Island, as an exponent of the sort of ability which had made it possible.

General Bullard is a past master in the art of telling stories, and his brief address consisted largely of pertinent ones. Alluding to Mr. Schwab's remarks on industrial relations, and drawing a parallel from his own army experience, he said:

As your organization grows, you gentlemen are going to lose touch with humanity unless you take pains individually to preserve it. You have had very graphically pointed out to you the only way by which you can succeed and maintain your standards and the American standards, and that is by maintaining your relations with the men who are working under you. Gentlemen, when your organization grows, be prepared to pass the spark of humanity down to the last workman under you. Otherwise you have not got them. They will go from you.

Annual Meeting of The Rubber Association of America.

THE FIFTH ANNUAL MEETING (under the present charter) of The Rubber Association of America, Inc., was held at the Waldorf-Astoria, New York City, on the afternoon of January 5, 1920.

President Homer E. Sawyer presided. The session was a short one, such formalities as the reading of the call and the minutes of the last meeting, etc., being dispensed with, upon motion from the floor.

There were distributed a printed report of the general manager and secretary, and the financial statement prepared by the treasurer covering the year 1919.

PRESIDENT SAWYER'S REPORT.

In making his report Mr. Sawyer spoke in part as follows:

The principal activity of your president, at least during the past year, has been the endeavor to organize the Association along lines which it quickly became apparent, this year, were necessary. Prior to the war, as we all knew, we were largely a social body, and we had good times, but we did not conduct, between the good times, much business. Our annual banquet and our annual outing were the principal features of the year and in between times we simply attended to our own business and paid little attention to the business of the Association.

CONTINUITY NEEDED IN ASSOCIATION ACTIVITIES.

During the war, under the administration of Mr. Firestone and Mr. Work, everybody worked, and it did not become apparent that the Association as an association was not organized to carry on the regular work of the Association. We have had associated with us, fortunately, as the head of our Traffic Committee our Mr. Viles, and notwithstanding the fact that the United States Government tried very hard to steal him from us, we finally succeeded, on the first of July last, in installing Mr. Viles, as not only secretary, but general manager of the Association. Since that time I do not hesitate to say that he has done all the president's work. Seriously, however, it was essential that we should so organize as to have continuity in the work of the Association for the future. That there has been some real work done, I know is known to many of you individually. I feel sure that many of you have individually received help and benefit from Mr. Viles' organization. That will be the aim of the Association to provide more efficiently for in the future.

COMMITTEES DOING VALUABLE WORK.

It may be, that in the individual committees there is a feeling that we do not accomplish enough in those divisional committees. I am inclined to think sometimes, however, that the things that some of us would like to accomplish in those divisional committees, the authorities in Washington would frown upon somewhat; and secondly, many things which might be very good for us, from our standpoint, cannot properly be done or undertaken.

The greatest committee, the committee having the largest problem, is naturally the Pneumatic Tire and Truck Division, so ably presided over by Mr. Stadelman and by Mr. Broadwell as vice-chairman. They have done splendid work throughout the year. Aside from the divisional committees there are committees of general character like your Traffic Committee, your Legislative Committee, your Statistical Committee and Industrial Relations Committee. If they alone were all that we could expect from the Rubber Association they would, I believe, warrant all of your support, both moral and financial.

Mr. Viles will a little later speak more specifically regarding his report, and I know that you will excuse the Chair if he closes his remarks simply with a strong plea for your hearty cooperation with your board of directors and with your officers and with your general manager in the coming year.

GENERAL MANAGER VILES' REMARKS.

Amplifying his printed report, Mr. Viles outlined the contemplated work of the Association more in detail, emphasizing the importance of cooperation on the part of members. Said he:

PROMPT OPINIONS FROM MEMBERS HELPFUL

Every communication that is sent out from the Association offices we believe to be of some importance, perhaps not of so

great importance to some branch of the industry, but yet of some importance to individual members; and I would like to say it would be very helpful in connection with all communications particularly asking for an expression of opinion to receive a reply from every member. It hampers the work of the divisions to a great extent in the failure to receive, without four or five written letters being sent, replies giving the members' views on various questions of importance.

MOTOR VEHICLE CONFERENCE ON PROPOSED LEGISLATION.

Now, we formed in connection with the Tire Division a motor vehicle conference. That conference is composed of representatives of six associations: The National Automobile Chamber of Commerce, The Motor and Accessories Association, The Three A's, the Trailers, The National Auto Dealers' Association, and the Rubber Association, who have made a contract with the Law Reporting Co. for a report of all legislation that is proposed in each State Legislature throughout the year, that report to be made to the Motor Vehicle Conference immediately after the bill has been printed or typewritten in the various Capitols. Now it is proposed, in that way, to keep an absolute check, and to be in a position to shape policies with respect to all legislation in respect to the automotive industry; and any of the individual members located in the various states can greatly help that service, if they know of any local situation or any municipal situation, or county situation which they believe the weight of the division can help them correct; or if they believe that the Conference Committee's records or the counsel can be of any use to them. So I ask you to give special consideration during the year to any matter coming from the Motor Vehicle Conference through the Tire Division with respect to legislation.

IMPORTANCE OF QUESTIONNAIRES.

Now, you will find a reference here, in the general remarks right next to the last page, to the questionnaire situation. I presume the term "questionnaire" is like castor oil and a lot of other things that have a bad taste to some; but I feel that there is a little misunderstanding, and, perhaps, a little lack of appreciation for the necessity for that sort of thing at this time. The form of the questionnaire has been given a great deal of attention by our Statistical Committee. They believe that the industry not only wants to know its condition in so far as the figures will reflect its condition, but they also feel that in legislative work which is now before us, and the legislation that will come up in the various states and in the coming legislation, that those figures are going to be extremely valuable from a defensive standpoint and if the necessity for them arises, that is, for their immediate use, arises, they are worth 100 per cent more, if we have them right on tap. I feel that for our activities in Washington alone, for the next few years, these statistics are going to be very valuable.

WILL HELP SOLVE TRANSPORTATION PROBLEMS.

In your transportation work, you are facing the most chaotic situation that this country has ever known. I do not feel that the transportation managers of Washington know where they are coming out of the thing. A United States Senator remarked to me a short time ago that there are 98 Senators, and that they have 98 different ideas as to how these railroads are going to be handled, and I think you are going to have 98,000 different propositions with respect to how adjustments should be made and operating service maintained and as to the various other questions that come up within the next two or three years; and you will have situations respecting our industrial work, you will need every ounce of energy, and every bit of cooperation that the Traffic Committee can give; and their work will be augmented to a very large extent if we have the statistics from the questionnaires, so that we can come before any railroad committee or any legislative committee or body acting on railroad matters, with facts, show our position and support it, and get a reasonable measure of justice. I feel that the questionnaire is a vital thing and should have the support of everybody. I do not think that many of you realize what these figures mean when they are all put together, and I further think that a great deal more can be done with them.

TRAFFIC BUREAU READY TO ASSIST MEMBERS.

The Traffic Bureau during the year has increased to a committee of 22, starting with only four a little over a year and

a half ago. It represents all parts of the country in which the industry is located, small and large companies and the various branches of the industry. It has performed some very good service; it has saved some very large sums of money and we hope during the year that all managers on transportation problems will keep in touch with the committee, whether small or large or local or individual companies. We are always glad to help. We have organized a very high-class tariff bureau in our office, putting it in position to quote rates and prices regarding service, information regarding claims, and anything of that nature, and we have a man there whom we can send out. If any of you managers want to start a department of your own or want assistance in that department, we have the advice and the information to furnish the basis of an organization and we would be very glad to extend the service to all members of the Association.

MORE INTEREST IN SECURING NEW MEMBERSHIPS.

One other thing I noticed, that we are receiving quite a few applications for membership from comparatively new companies, and our friends the importers are very active in securing these applications. I think they are to be congratulated on their interest in the Association. I would like to see the same or more interest in securing new memberships throughout the Association on the part of the manufacturers. Most of you, perhaps, have some neighbors who may not be members of the Association. Try to find out whether they are or not and bring them to church along with the others.

INDUSTRIAL RELATIONS COMMITTEE ORGANIZATION.

In response to a question by Mr. Hodgman, Mr. Viles explained the plans of the Industrial Relations Committee more in detail. His remarks in this connection follow:

You will find in the report, gentlemen, a reference to the Industrial Relations Committee that has just been formed. Now, that committee is organized somewhat along the lines of the Traffic Committee with an executive committee of ten; and the Executive Committee of the Association has authorized an increase of that committee to 25 so we will have an executive committee of ten and a general committee of fifteen, making a total of 25 people. The committee has been selected with due regard to territorial representation and the size of the various companies, and to the various branches of the work, and we believe it is going to be very successful. The primary purpose is this:

PURPOSE OF THE COMMITTEE.

That the labor situation is entirely different than it was in what we might term normal times. It is not believed by many, large numbers of our people, manufacturers, that the country will ever get back to the labor conditions of the past. Labor has taken a new stand for better conditions; they have new viewpoints in a conception of their own rights and duties, and the manufacturer has necessarily, even if he would not—there not having been time to attempt to form a policy—he has had to meet the situation. And we think that the Industrial Relations Committee, having analyzed the various methods used in selecting the employees and deciding as to employees' privileges and the conditions under which they shall work; in fact, the whole employment relation, by an analysis of the various methods used by all members, can select from that mass of information, the best points to all of them and assemble them into one composite system and put them out for your consideration. That is one thing.

PLAN OF ACTION.

We purpose to keep in touch, through a service somewhat similar to that of our Tire Division, with all proposed labor legislation and it is to be given to you as a matter of information. The Industrial Relations Committee would be glad to receive expressions regarding, we might say, suggestions of all kinds; in fact, at each meeting we will prepare a docket and all members of the Association will be asked to suggest subjects which this committee can consider, such information as they can gather or suggestions which they can make to them. There is nothing in their work of a paternalistic nature, nor will they tell you you must do something, nor will they ask you to do anything in any peremptory way; they will simply go to you as a matter of getting or giving advice. And this advice we hope will be of great benefit to you.

INDUSTRIAL RELATIONS NEED MORE ATTENTION.

Touching upon the intention of the Board of Directors to enlarge the various committees in order to ensure wider terri-

torial representation and to embrace large, medium and small manufacturers, the president further emphasized the need of devoting more attention to the matter of better industrial relations:

We all agree that not only is there the necessity of more attention to the question of industrial relations, but we want to give a greater attention to it. The day, we believe, has gone by when we can simply flatter ourselves that our own house is in order, and that, consequently, we are safe. Some of us, instead of using the words "Capital and Labor" have chosen to use the words "Management and Employees." And certainly I feel that management and employees must establish much more intimate points of contact in the future than in the past. And as I said a moment ago it is not sufficient for us to smugly assume that our industrial relations are good with our employees, because the disease or a contagion of bad relations between management and employee in our immediate vicinity, even if it is not in connection with our own industry, can easily spread into our own better managed companies to the detriment of our companies. I do not think there is anything that business men or public spirited men in any walk of life can turn their attention to with a greater sincerity of purpose and open mindedness and a real heartiness than to try to improve industrial relations conditions in this country of ours. Some of the larger companies have selected during the past three or four years specialists in that line of work. Some of the smaller companies have already done so, and as fast as the Association finds that any company has a specialist in that line that has something helpful to bring to their gathering, he may be sure he will be asked to come along with his ideas and his suggestions.

ELECTION OF NEW DIRECTORS.

The names of the gentlemen placed before the membership by the Nominating Committee for election as directors, for three years from January, 1920, were, upon motion from the floor, presented for a vote and the nominees were unanimously elected. Their names follow: A. H. Brown, J. S. Broughton, J. W. Maguire, W. O. Rutherford and H. E. Sawyer.

Formal action was taken, requesting the Board of Directors to continue the work undertaken and in contemplation in connection with the gathering of statistics through the medium of questionnaires, as the opinion was expressed that the work is valuable and its results would prove of much service in the future.

AMENDMENTS TO THE CONSTITUTION AND BY-LAWS.

Suggested amendments to the Constitution and By-laws were formally adopted, the intent of which is stated in the following:

First: The providing of more definite and specific conditions under which firms, corporations or individuals, not directly engaged in the rubber industry may participate in the activities of The Rubber Association of America, Inc. The suggested amendments include certain limitation of voting power and different annual membership dues. They also provide that those firms, corporations or individuals not directly engaged in the rubber industry, which are now members of the Association, shall automatically upon the adoption of the suggested amendments become affiliated members.

Second: Specific provision to the effect that membership in the Rubber Association is not transferable from one firm, corporation or individual to another under any conditions.

Third: Specific provision to the effect that membership in the Association will be for the calendar year instead of for a year from the first of the month following election.

ELECTION OF OFFICERS.

Immediately following the general meeting, the Board of Directors met and the officers of the Association during the year 1920 were unanimously reelected to serve during 1920 as follows: President, Homer E. Sawyer; first vice-president, Harry T. Dunn; second vice president, F. A. Seiberling; general manager and secretary, A. L. Viles; treasurer, W. C. Cox.

W. J. Kelly and J. S. Broughton were elected to serve on the Executive Committee for the coming year and the Board appointed a Legislative Committee to consist of General Counsel, Charles Neave, F. C. Van Cleef and Ernest Hopkinson, and the appointment of the remaining standing committees of the Association was referred to the Executive Committee with power to act.

REPORT OF THE GENERAL MANAGER AND SECRETARY.

The change in the management of The Rubber Association of America, brought about by the creation of the dual position of general manager and secretary on July 1, 1919, presented many difficulties with respect to the preparation of the Annual Year Book, particularly because of the general manager's lack of personal connection with or knowledge of the War Service Committee just prior to its dissolution and the reconstruction plans undertaken following that event. Also the labor troubles which paralyzed the printing industry in New York City were of such a protracted nature that it was concluded that the publication of the Year Book was decidedly impracticable.

For these reasons a large 8-page printed report of the general manager and secretary was distributed to all Association members in lieu of the Year Book, which will probably be issued not later than three months following the annual meeting. The printed report is a welcome innovation, giving as it does a summary of the Association work for the year 1919, as it has been detailed monthly in THE INDIA RUBBER WORLD, presenting a comprehensive view of the work of the various divisions and committees, outlining somewhat the plan of action for the present year, and emphasizing the need of co-operation on the part of members to make it a success.

DIVISIONS' MEETINGS.

MEETINGS of the following divisions were held on January 5, 6 and 7, 1920, and officers elected for the ensuing year:

BOOTS AND SHOES DIVISION.—The Boots and Shoes Division met at the Union League Club for lunch on Monday, January 5, and the business of particular interest was the adoption of by-laws and the change of the name of the division from "Boots and Shoes Division" to "Footwear Division."

FOREIGN TRADE DIVISION.—The Foreign Trade Division held its meeting at the Yale Club, January 5, seventeen companies being represented, and officers and an executive committee were elected as follows: chairman, A. R. Gormully, Ajax Rubber Co., Inc.; vice-chairman, A. W. Magee, Kelly-Springfield Tire Co.; G. C. Chalmers, Hodgman Rubber Co.; R. H. Daniels, The Goodyear Tire & Rubber Co.; A. A. Garthwaite, Lee Rubber & Tire Corporation; A. S. Hardy, Manhattan Rubber Mfg. Co.; E. H. Huxley, United States Rubber Export Co., Ltd.

It was determined that the Executive Committee would hold regular monthly meetings at the offices of the Association.

A sub-committee was appointed to confer with the Federal Trade Commission at Washington regarding the interpretation of the Webb-Pomerene Act and to present facts and arguments, if necessary, in support of the views of the Foreign Trade Division respecting the needs of the rubber industry in this connection.

MECHANICAL RUBBER GOODS MANUFACTURERS' DIVISION.—This division met at the Yale Club January 5. John J. Voorhees, Sr., was unanimously reelected chairman of the division and C. E. Cook was elected vice-chairman.

A departure from the previous organization plan was determined upon to the extent of having four vice-chairmen, one for each of the districts in which the manufacture of mechanical rubber goods is somewhat centralized, i.e., New York, New England, New Jersey and the Middle West. The election of the three other vice-chairmen, however, was referred to the Executive Committee with power, following the amendment of the by-laws of the division, to provide therefor.

RUBBER PROOFERS' DIVISION.—The Rubber Proofers' Division met also at the Yale Club, January 5. The following were elected to office and to membership on the Executive Committee: chairman, Dr. L. C. Himebaugh; vice-chairman, Warren McPherson; Executive Committee: chairman, Dr. L. C.

Himebaugh; vice-chairman, Warren McPherson; J. J. Clifford, Frank Post, J. T. Callahan.

The Publicity Committee to act during the year was appointed, consisting of James Meade, W. E. Cavanagh and W. Keyes.

Certain routine matters, particularly in connection with the uniform contract which is being developed by the division, were handled.

RECLAIMERS' DIVISION.—The Reclaimers' Division met at the Yale Club, January 5, and the officers and members of the Executive Committee who served during the year were unanimously reelected as follows: chairman, E. H. Appleton; vice-chairman, Clark W. Harrison; Executive Committee: E. A. Andersen, John S. Clapp, R. A. Low, J. S. Lowman, Joseph F. McLean.

The Technical Committee, as constituted for the year 1919, with the exception of Dr. L. E. Weber, ex-officio member, was reappointed as follows: Chairman, L. J. Plumb, W. B. Pratt, C. J. Howell, T. E. Furness, Joseph E. Russell.

Certain details in connection with the specifications for the standards and packing of scrap rubber, which are promulgated by the Division, were given attention.

RUBBER CLOTHING MANUFACTURERS' DIVISION.—This Division met on Tuesday, January 6, in the office of the Rubber Association, and officers and an executive committee for the year 1920 were elected as follows: chairman, N. Lincoln Greene; vice-chairman, A. W. Warren; Executive Committee: N. Lincoln Greene, A. W. Warren, C. Kenyon, W. M. Tenney, G. H. Rockwell, J. T. Callahan.

A number of subjects involving matters of a routine nature were given attention.

RUBBER SUNDRIES MANUFACTURERS' DIVISION.—The Executive Committee of this division met at the Union League Club for dinner on the evening of Tuesday, January 6, and the Division met at a general meeting for lunch at noon on the following day. C. J. Davol and H. A. Bauman, who served during 1919 as chairman and vice-chairman, respectively, were unanimously reelected, and an executive committee, consisting of the following named, was elected: chairman, G. J. Davol; vice-chairman, H. A. Bauman; Executive Committee, W. S. Davison, S. H. Jones, W. H. Balch, E. E. Huber, A. W. Warren.

TIRE MANUFACTURERS' DIVISION.—The Joint Executive Tire Committee met in the Association Rooms, January 7, and gave its attention to several subjects of interest and importance, and then adjourned to attend the general meeting of the Tire Division with luncheon at the Yale Club. There were forty-eight in attendance at this meeting.

Following luncheon the meeting was formally convened with A. G. Partridge, vice-president of the Firestone Tire & Rubber Co., in the chair.

A resolution was passed, dissolving the Solid Tire Manufacturers' Division in order that it might amalgamate with the Pneumatic Tire Manufacturers' Division because of the interests of the two being substantially identical and the membership of the Pneumatic Tire Manufacturers' Division so greatly exceeding that of the Solid Tire Manufacturers' Division. The name of the Pneumatic Tire Manufacturers' Division was changed by resolution to "Tire Manufacturers' Division" and a sub-committee is to redraft the by-laws so as to provide for the interests of all tire manufacturers.

John Kearns, of the Lee Rubber & Tire Co., was elected chairman; Seneca G. Lewis, of the Pennsylvania Rubber Co., was elected vice-chairman. The division has an executive committee of fifteen and the following firms were elected to membership thereon for the year 1920: Ajax Rubber Co., Inc., Empire Tire & Rubber Co., Firestone Tire & Rubber Co., Fisk Rubber Co., The General Rubber Co., The B. F. Goodrich Co., The Goodyear Tire & Rubber Co., Hood Rubber Co., Kelly-Springfield Tire Co., The Miller Rubber Co., Norwalk Tire & Rubber Co., The Portage Rubber Co., Swinehart Tire & Rubber Co., United States Rubber Co., Victor Rubber Co.

Influence of Present Exchange Situation on Competitive Position of American Rubber Industry in Foreign Fields.

By L. W. Alcega-Schmidt.

THE RECENT DECLINE in the exchange upon America has resulted in a considerable disorganization of American foreign trade which has found its principal expression in a general disinclination of American exporters to accept anything but dollars in payment. It is now argued that the present situation if left to continue, is likely to lead to a general breakdown of our export trade, as foreign countries will hardly be inclined to buy American merchandise upon the basis of the present exchange rate as against the high price of the dollar. Exporters of rubber tires and other rubber goods have received many cancellations of foreign orders during the last months and are inclined to attribute this condition exclusively to the exchange situation. They hold that the American rubber industry is in danger of becoming uncompetitive in the international field. Several remedies have been proposed; so far, however, no action has been taken, principally because of the lack of a basis upon which a settlement can be obtained.

TIRES AND EXCHANGE RATES.

It will be shown in the following that the situation is by no means as serious as it appears on the surface, and that its disastrous effects upon international trade are not caused by the devaluation of foreign money itself but by the present frequent fluctuations of the market.

The situation most frequently quoted is that of an American manufacturer, say one making tires, negotiating for a tire contract in France or England. Let us assume the tire to be a 34 by 4½-inch fabric tire, of standard make and costing the consumer \$44 in the United States. This tire costs to-day in France 300 francs. It costs £9.10 in England, 274 pesetas in Spain, and approximately \$37.80 United States currency in South America. Applying normal exchange, the dollar value of this tire would be \$57.90 in francs, \$46.17 in England, and \$52.88, approximately, in Spain. The normal exchange rate of the pound sterling is \$4.86, of the franc 19 cents, and of the peseta 19 cents. On the

approximately, owing to a fractional increase of the cost of the peseta over par. On the other hand, the English purchaser of an American tire would have to pay £11.18,—the French 484.88 francs, and the Spanish 270 pesetas, approximately. We have therefore, at the present time at least, the peculiar situation that one and the same tire can be purchased and sold at varying rates in each of these countries owing to the variation of the exchange.

Such a situation can act on the American tire trade in two different ways. It might enable tire importers in this country to purchase for dollars great quantities of tires in England or

PRICES OF TIRES CORRESPONDING TO THE AMERICAN 34 BY 4½-INCH FABRIC TIRE IN ENGLAND, SPAIN AND FRANCE, WITH UNITED STATES MONEY EQUIVALENT AT NORMAL EXCHANGE RATES.

France and to sell them here at a cost very much below that for which they can be offered by other manufacturers. But it will also deter the French and English purchaser from buying tires in the United States at the practically preventive exchange rates of their respective money units existing just now. Also there is a third consideration: to which country will the world's markets go for supplies in the present situation, to the United States, to France or to England? But the present-day situation is only an incident of the overshadowing problem of international competitive ability of which it forms a part.

COMPETITION IN PRODUCTION.

The exceptional demand for rubber goods from domestic and foreign markets during the last years has put out of operation the ordinary rules of competition that govern the world's market

in normal times. Goods were needed urgently and cost was no consideration. Under these conditions there was no difficulty for any manufacturer to sell at his own prices. It was a typical sellers' market with no string to it in any respect. But the conditions must change again, in fact they have already changed. The world's business can not be conducted permanently on a war basis, and after a while the rules of ordinary competition will return. The United States rubber industry will then find very

PRICES OF TIRES CORRESPONDING TO THE AMERICAN 34 BY 4½-INCH FABRIC TIRE IN ENGLAND, SPAIN AND FRANCE, WITH UNITED STATES MONEY EQUIVALENT AT PRESENT EXCHANGE RATES.

day of writing this article, December 19, the following quotations were made in international dollar exchange: pound sterling \$3.72, franc \$0.09, peseta \$0.191. If purchased in dollars, a tire equivalent to the American one could have been bought in England for \$35.34, in France for \$27, and in Spain for \$54,

strong competition from unexpected quarters. We know little yet about the actual conditions in Europe. The European rubber industry has operated during the war under high pressure. Rubber has generally come more into prominence, and the experience and knowledge of the war applied to modern manufacturing

could not give effective support to the European rubber industry.

Competitive production is not only a matter of manufacturing method; it goes right down to the very roots of the industry. The ability to compete springs from the volume of the original investment, of the productive capacity and cost of labor and from the effectiveness of the equipment. It depends upon the price of the raw material and the overhead expenses of the industry. We can, therefore, easily concede points to Europe for new inventions and improvements in the method of the industry if we can only meet competition as to the cost of labor, materials and the general operation of our plants.

If it should prove that we pay more for our raw materials, that our labor costs us more than it costs the European manufacturer and that our overhead expenses are higher, then we may very well experience a severe set-back in the prospects of our industry. Europe will not only take away from us our recently gained export markets but it also may attack us in the domestic market.

CRUDE RUBBER AND FOREIGN EXCHANGE.

There is little reason to expect that European rubber manufacturers should be able to buy their rubber much cheaper than our own manufacturers. The American rubber manufacturer has bought rubber as cheaply in London as the English in pre-war times and the freight has not made much difference in the cost of the product at the door of the factory. During the war this condition has still more improved as we have discontinued largely the old practice of buying in Europe but have purchased and shipped our requirements at the source. The cost of the raw material, therefore, will not favor in future any side any more than it has in the past, and the chances are even that the scale may dip slightly in our favor.

This chance is supplied by the present exchange situation. As neither France, nor England, nor the United States, is able to produce rubber in their respective countries, they must necessarily buy it somewhere else, in Brazil, Africa, or Singapore, for example. In these markets each of the purchasers appear on his own merits. But the American purchaser, at least at the present time, has the advantage of the greater purchasing power of the dollar. Where the English manufacturer still pays twenty shillings to the pound sterling, the American pays only \$3.72 which gives him a superiority of approximately 20 per cent in his purchase.

OTHER SUPPLIES.

What applies to the principal product, applies also to the supplementary ones, as the textile fabric in the tires, chemicals, etc. The rise in the cost of many of these has been quite phenomenal. These supplementary supplies are not so narrowly confined to their original sources as rubber. Of course, for the fine cotton required for tire fabrics we rely almost exclusively on Egyptian cotton, as the Sea Island product is not at present available in sufficient quantities. But it appears that we should be able to purchase this cotton as cheaply or expensively as our European competitors. Our position as to chemicals probably is less favorable. England, France, and our other European competitors have manufactured these products generally cheaper than our own factories, and they most likely will continue to do so. It may be said that we can purchase these products from them, and by doing so can share in their advantageous position. But since the war much has changed in our own chemical industry, and it may become a matter of good policy that we should favor rather our national producers instead of the foreign, even if we should have to pay a higher price. After all is said, there remains, however, the fact that matters will remain practically unchanged and that the advantage in buying will remain pretty much where it was before the war.

Conditions are different as to labor. In this respect we have to deal in Europe with three distinct groups of production, each

having its special problems of labor, and each being differently affected by the recent reorientation.

LABOR SITUATION.

In England and France little has changed in the outward position of labor. True, it has increased its political control in the first-named country, but the English workman has always exerted a certain influence upon the industry of the country by

It is an expensive matter for the purchaser to buy an American, 34 by 4 1/2-inch fabric tire with the depreciated money of England and France.

way of a very well developed system of trade unions. Conditions are similar in most of the neutral countries and in Italy. In Germany, however, great changes have taken place and are still under way. The German working population is not only taking part now in the management of the political affairs of the nation but it has become the government itself. The change has been always to the best interest of the industry of that country but the outlook is rather hopeful and in the end a fairly sound system of cooperation between manufacturer and workman may be obtained. Nothing has yet been decided as to the status of labor in the newly created republics east of Germany, such as Poland and Bohemia, while in Russia proper at the present time labor has not only control of the governmental machine but has taken in charge the whole nation. This growth of the political influence of labor has been followed in each instance by a rise in wages and it is this aspect of the situation which is of most importance for the future competitive position of the European rubber industry.

WAGE INCREASES.

Wage increases have varied a great deal in the different parts of Europe. In England wages have gone up at rates varying between 75 and 100 per cent. Wage increases, however, have been generally more heavy on the European continent because wages were lower there than the average wage scales paid in England. In France, for instance, the rubber industry now pays easily 150 per cent more than it used to pay in pre-war days, and in Germany increases have been as high as 200 per cent and even more. Conditions in Germany are very unsettled and the present wage movement has not come to an end yet, owing to the continual depreciation of the German exchange. We may take it, however, for granted that continental European wages in the rubber industry will settle down finally upon approximately the same level as that prevailing at the present time in England. This will bring about a great change in the competitive situation in Europe.

In pre-war times it was generally acknowledged that the continental European factories were able to out sell the English ones in their own market. As the result there existed in London a great number of European continental agencies selling the product of their respective factories in competition with English manufacturers. During the war, a noticeable reduction in the number of these agencies has taken place and their return in the same strength is not expected. England in fact may be able to hold

very well its own market against foreign competition. But the increase in wages has also changed the competitive position of Europe as a whole in its relation to the non-European markets. The European rubber industry has done an enormous non-European trade in former years, based principally upon its ability to sell at low cost. The European manufacturer had only little in his favor in the purchase of raw materials, his chances to sell cheaply, practically speaking, rested entirely on his possibility of getting his work done at a low wage scale. On the strength of the cheaper European labor the European rubber manufacturer, therefore, was enabled to undersell his American competitor practically wherever they met in the world.

Of course, while European wages have risen, there has also taken place a considerable increase in the wages paid by our rubber manufacturers. The question now is: Have these American wage increases outdistanced the European and have they reestablished in this manner the same difference in the cost of labor in favor of the European rubber manufacturer that existed before the war? American wages in the rubber industry have grown exactly 100 per cent since the summer of 1914. But the chances are that the American wage movement has now reached its highest peak. When the end of the movement has been reached it will most probably show that American wages are still higher than the European wage scale but that the European scale is approaching more closely our own than was the case before the war. Our handicap would no more, therefore, be as extensive as it has been in former years and we might very well aspire to overcome it by making reductions in our overhead expense, a procedure in which we have acquired much experience.

OVERHEAD EXPENSES.

Overhead expenses in the rubber industry are comparatively high. They comprise approximately 25 per cent of the sales price of the ready product at the factory door. Like all other forms of manufacturing expenditure they have grown considerably during the last year in this country but they have still grown more rapidly in Europe. In comparison with the heavy war expenditures of the European countries ours have been small. True, we have lent heavily to our associates in the war but we must assume that these debts will be repaid one day. We also have followed the very wise procedure of clearing up a great mass of expenses by the medium of immediate taxation that will relieve our industry from further heavy increases in this respect after once the present period of high taxation has ended. But while we seem, therefore, to be well placed as far as direct overhead expenses are concerned, it is doubtful whether we can claim the same as regards indirect overhead expenditure. It is up to every rubber factory to correct a faulty expense system and to make economies of one or the other sort. It will in doing so certainly reduce the cost of production and will keep its goods competitive in the international market. But the individual rubber manufacturer has no influence upon the more dangerous form of overhead expenses which derive their origin from national sources. These overhead expenditures, as railroad freights, shipping freights, and others, have to be met by each manufacturer as an unalterable quantity. They affect his business as much as that of his competitor, of course, but their growth or decline upon a national basis is of considerable influence upon the standing of a whole industry when entering international competition. Of this national overhead the rubber industry of the United States has had to carry lately a more than usual burden which has been increased still further by a rather pernicious system of intentional restraint of production.

It is this form of expense increase which is at present the most serious charge upon our national cost of production and which forms a great danger to the competitive position of our rubber industry. We have, therefore, so far established the following facts:

The purchase price of a French or English tire, if bought with American money, has declined.

The purchase price of an American tire, if bought with French or English money, has increased.

The price of an American tire in Europe, therefore, has reached at the present moment a level that renders it uncompetitive, while a French or English tire can be sold much cheaper in the United States than an equivalent American tire.

In the language of the economist: a point has been reached where the export of rubber products becomes unprofitable in our market, as its purchasing value for other goods has declined. But this adverse condition must pass very soon. French and English exchanges have declined not only in the direction of the United States. They have also shown a considerable decline in other directions. In these markets the purchasing value of French and English money is lower than that of the dollar which has remained approximately at par. This development has already resulted in a purchasing movement in favor of the two countries for such merchandise as is manufactured exclusively inside England or France. But the lower exchange operates in this instance very heavily against the selling country, as it reduces materially the available funds for exchange purchases. The raw materials bought by either France or England in exchange for industrial products cost these two countries not the price of the normal exchange, but the additional cost caused by loss of exchange.

THE REMEDY.

To meet this situation these countries will have to raise their prices to a point where it becomes profitable to them to sell their merchandise in exchange of the foreign product. This step has been taken already in many instances as indicated by the rapid rise in the cost of many raw materials and manufactures which we import ourselves from the countries in question. The time has come, then, when the real test of comparative competitive ability applies. To which point will England have to raise its tire prices so as to meet the demands of labor, cost of materials, overhead, and essential manufacturing profit? Will this bring the cost of its tires to a level considerably higher than that at which the same tire can be supplied by the United States? The chances are that the weight of the heavy national overhead expenses of Europe and the enormous loss in purchasing power caused by the devaluation of its money will favor the United States producer.

This answers also the present problem. We can not expect European exchange to rectify itself as rapidly as has been the case after other wars. The burden is too great to be borne easily. But a stabilization will be attempted that will remove the principal disadvantage of the present situation—that of the permanent changes in the market quotation of foreign moneys and the general disorganization of all international trading resulting from it. If we know the franc will buy 10 cents worth of our merchandise or of raw materials of other countries, we can sell and buy upon this basis. After a while all trading will readjust itself accordingly and competition will not depend upon the varying chances of the money situation but upon the ability to produce at a competitive price. There will be no handicap and no favor. Under such conditions the American rubber industry should be well able to prosper in its foreign dealings.

AN ITALO-AMERICAN ASSOCIATION FORMED.

A *Unione Italo-Americana* has been formed recently in Rome. It is intended as a center for all Italo-American committees and has several sections—economic, intellectual, art, legislative, publicity. It is supported by financial establishments and business men who wish to foster the commercial and economic relations between the two countries, and seek from the United States in some degree the backing which Italian industries and commerce received from Germany before the war.

The Association is housed in the Palazzo Salviati on the Corso Umberto, and has set up an information office for American business men, a library of American industries, and a general meeting place for business and social purposes.

Cotton Bonanza in the Southwest.

TIMES OF THE COTTON CROPS in southern California and Arizona begin to rival those of the early gold discoveries. When the United States went to war every effort was made to induce the planters to increase their acreage in anticipation of a long and protracted struggle, and now the results are beginning to show in the prediction that this year the net yield to the growers in this section will be in the vicinity of \$40,000,000.

When it is considered that this addition to the wealth of the country is gained mostly from sections which were formerly considered waste and unprofitable lands the achievement from a financial standpoint seems all the more remarkable. Regions in California previously considered prosperous have been made more so while desert spaces of Arizona have been made to yield from \$150 an acre upwards. Families that several months ago were living from hand to mouth and were barely able to rent land on a crop basis are now riding round in automobiles, according to reports from these districts.

Altogether more than 177,800 acres are planted to cotton in southern California and Arizona. In Imperial Valley 67,816 acres are planted on the American side of the line and 60,000 acres are planted on the Mexican side, yielding from half to three-quarters of a bale per acre. Prices for 100,000 bales produced the past year in Imperial Valley are said to have ranged from 35 cents to 55 cents a pound. These record prices, the result of a shortage of cotton throughout the South, have so enthused the valley that the planters are already figuring on a further increase of cotton acreage. As to the grade of the cotton produced, this can best be illustrated by the market reports. When the December delivery in the New Orleans market was quoted at 38 cents a pound, the price of the Imperial Valley product was 53 cents, a premium for quality of 15 cents a pound.

As an illustration of the growth of the industry in Imperial Valley, arrivals of 50 cars a day at Calexico, the cotton center of the valley, are not infrequent. On the first of November the

approximately 25 gins in the valley, by far the larger number are located at Calexico and Mexicali.

These two towns are unique, in that they are the only places in the United States where cotton is received in carload lots for ginning. The gins in the South are scattered through the cotton raising section and are more numerous, but the cotton is invariably hauled in wagons from the field to the gins. Ten carloads of seed a day are brought across the line, some of it being compressed in Calexico, but the bulk of it going to oil mills in Los Angeles. Some of it is shipped to Texas, also for compress.

SACKING ARIZONA COTTON.

Imperial Valley cotton seed is always in demand at high prices as oil mill men who buy for its oil content say it is richer in oil than any grown elsewhere in the United States. A large amount is shipped east to points where the crop is poor and is there replanted, even growers in the South recognizing it as superior to any produced in even the best cotton-growing sections.

Pima or Egyptian cotton has come into favor in a few sections of the valley, and it commands a price of from 55 to 85 cents a pound, but it is very difficult to gin properly. The gin at Seeley is said to be the only one adapted to handling this kind of cotton. The variety generally grown is the Durango or medium long staple variety, which made its way several years ago from Mexico where plants were growing along the ancient ditch banks and canal beds. This cotton attained its highest state of maturity in the Imperial Valley and is widely cultivated. Seven thousand acres were planted to Pima or Egyptian long-staple cotton last year, but because of the market, which has not yet become fully developed, the growers experienced difficulty in getting the price they anticipated and the acreage dropped this year to 5,000.

Imperial Valley has been entirely free of labor difficulties the past year. On the American side of the line the pickers have received \$2 a hundred, averaging \$4 a day and up, and on the Mexican side Chinese laborers who picked the crop averaged \$1.40 a hundred. Cotton insect pests are rare, but one, the "leaf miner," being heard of to any extent. The best remedy for this is to plant early and to pick as soon as possible. The insect does not get started until late and does no particular damage if the cotton is handled in this manner.

Palo Verde cotton acreages for the last five years have been: in 1915, 1,700; in 1916, 4,800; in 1917, 7,000; in 1918, 12,700, and this last year 20,000, representing a growth in aggregate crop values each year from a few thousand dollars to over \$5,000,000. Crop conditions published in the government reports in November, 1919, including up to October 25, show the average condition of

GIN-YARD AT CALEXICO, CALIFORNIA.

average daily receipts of cars at Calexico and Mexicali is around 15 cars, but this gradually creeps up and the high point is during the month of December. These cars are handled by the Inter-California railroad. A typical day's business last fall was the occasion when forty-nine cars arrived, seventeen of which were from across the line and twelve were consigned to one gin, ten being from this side of the line coming into Calexico and the remaining 22 being direct from Mexicali. A much larger number of carloads were picked in the valley that day, but gins at El Centro, Imperial, Brawley and Holtville took their share. Of the

the cotton crop in the United States to be 51.1 per cent of normal, while Arizona was 89 per cent and California 92.

The cotton situation in Arizona is highly gratifying to growers because of high prices, the comparatively cheap cost of producing and harvesting, and the continued steady demand for the product. Begun a few years ago as an experiment, the acreage has gradually increased until in 1916 there were 20,000 acres in this state devoted to raising this staple. The acreage of 1919 upon which "long staple" was produced was estimated as in excess of 50,000, the return to the growers being figured at between \$18,000,000 and \$20,000,000. The December cotton reached the extraordinary high figure of 85 cents a pound and producers believe it will go even higher. It is said to exceed in length, texture and fiber the famous Egyptian and Sea Island varieties, and is the kind most in demand in the commercial markets of the world.

It should be remembered that long-staple cotton is the most desirable for fabric and cord for automobile tires. Perhaps one of the greatest advantages that has accrued to Arizona as a result of the cotton crop is the stimulating effect it has had upon land values. Land which two years ago could have been purchased for \$25 an acre is now selling for ten times that figure and that for which \$150 an acre was the top price now commands \$500 an acre. The latter figure is set by present owners on large tracts formerly devoted to raising alfalfa. Good cotton land can be rented for \$50 an acre.

The Southwest Cotton Co., the county farm bureaus and the Federal Department of Farm Industry have combined to help the growers and encourage increased acreages. Every effort is being made by these agencies to propagate new varieties of cotton, to fight against the introduction of the boll weevil and other pests, and to introduce the best kind of machinery.

On the new desert lands the yield has been from $\frac{1}{4}$ to $\frac{1}{2}$ -bale per acre and on developed lands 1 to $1\frac{1}{2}$ bales. Each bale weighs 500 pounds, which, at 85 cents a pound, means each is worth \$425. There are no gins in the Salt River Valley for handling short-staple cotton.

RUBBERIZED WEBBING HANDLES FOR BOXES?

As a suggestion, rubber manufacturers may be interested in the box handles of webbing devised by the United States Forest Products Laboratory, Madison, Wisconsin, to eliminate the use of rope handles that take up valuable shipping space.

To obviate these difficulties, a webbing about $\frac{1}{8}$ -inch thick and $1\frac{1}{2}$ -inches wide, which has a breaking strength of 800 pounds,

(Forest Products Laboratory.)

METHOD OF ATTACHING WEBBING HANDLES TO BOXES.

is suggested. This may be inserted through saw-cuts made parallel to the grain in the ends of the box, turned down flat inside, and nailed securely with large-headed roofing nails.

Such a handle takes up no extra space either inside or outside of the box. It is easily made, and has a lifting strength with a large margin of safety.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered, nevertheless they are of interest not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

(770.) A request has been received for the addresses of manufacturers of endless gray air bags.

(771.) A manufacturer requests the addresses of manufacturers of aluminum bronze powder.

(772.) Inquiry is made for the address of manufacturers or licensees of tire-engraving machines.

(773.) A subscriber requests the addresses of manufacturers of varnish to apply to proofed raincoat fabrics to produce a leatherette effect.

The Manufacture of Elastic Fabrics.

One of the oldest of rubber products is elastic webbing. It is also one that is but rarely described. The European looms since 1914, were transferred from elastic webbing containing rubber thread to plain cotton webs for military use. American looms, however, therefore based upon the same principle, supply. The foreign demand still continues, hence the timeliness of this article.

ELASTIC FABRIC FROM RAW RUBBER.

Nearly ten years before Goodyear's discovery of vulcanization, India rubber was used in the making of elastic fabrics.

A factory in America and another in France produced quantities of these goods. The process was cutting balls of fine Para rubber in halves and pressing the halves out flat. From these, long, wide strips were cut by a circular knife, the strips being skived at the ends, and stuck together by hammering on an anvil. The wide strips were then cut into threads by a slitting machine, the threads being wound on reels, and left for a period of six weeks to harden. The weaving of this rubber thread into the fabric was first done on hand looms, the rubber being stretched as much as it would stand. Then the final touch was given to impart elasticity to the fabrics. This was accomplished by moistening the fabric, and running a heated iron over it, which process steamed and softened the outer covering, and allowed the stretched rubber to shrink to about two-thirds of its former length. This drew the woven covering with it and rendered the fabric somewhat elastic.

EARLY INVENTIONS.

Goodyear and other early inventors, after the year 1840, spent much time in experiments along the same lines, using sheets of vulcanized rubber instead of threads. Any loosely woven, non-elastic fabric will stretch more or less on the diagonal of the lines of the weave. This property was utilized by cementing fabric so stretched to a sheet of rubber. This was the basis of the Tyer patents. Another plan was to combine a soft, woven cloth with a stretched sheet of rubber by cementing the two together. Sometimes the rubber was placed between two such non-elastic fabrics. When allowed to contract, the rubber would pucker the cloth, or "shir" it, thus giving the compound material the name of "shirred" goods. But it was with the production of vulcanized rubber thread, and the adaptation of various looms to weaving into fabrics that the best product was evolved.

The materials entering into the manufacture of elastic fabrics are cotton, wool and silk yarns or threads, and rubber thread. The products are suspenders, garter webs, arm bands, goring for elastic side shoes, fabrics for surgical bandages, corsets, ladies' belts, and a thousand other articles where combined elasticity and durability are required.

WEAVING NON-ELASTIC FABRICS.

In weaving ordinary non-elastic cloths, the yarn, after arrival at the factory in skeins, is first dyed the required color, and then wound on bobbins or spools, some to be used for the warp and some for the weft or filling. In making the warp the requi-

site number of spools of this yarn are placed in a creel, so arranged as to carry out any desired color scheme; the ends are run through a reed, and then wound together on a large bobbin called a warp beam. This warp is then taken to the loom, and for the simplest form of cloth is threaded, by alternate threads, on two harness frames. In operation of the loom, these two harness frames rise and fall alternately, creating what is called a "shed" or opening through the warp threads, for the passage of the shuttle, which flies backward or forward at every "pick" of the loom, carrying the weft through the opened-up warp at each passage.

When a fancy weave is desired, the number of harness frames is increased according to the complexity of the design, and the movements of the harness are governed accordingly, the harness is

used in the pattern sometimes running as high as twenty-five. In more elaborate designs and effects the Jacquard machine is often employed, which, instead of operating groups or sections of threads by the use of harness frames, operates each individual thread independently. This is done by the use of cards having perforations to correspond with each thread in the warp, such perforations being cut according to design. These cards revolve round a cylinder, thus governing the move-

FIG. 1.—CROMPTON-KNOWLES SUSPENDER LOOM.

ment of each thread as the shuttle travels back and forth across the shed. Complex as are such looms, the elastic, narrow fabric looms are more so, because, instead of weaving a single fabric, they weave simultaneously a number of fabrics, from 12 to 48, according to the width and character of the goods being made. Each of these webs is made by a perfect loom in itself, having its own set of warps, shuttle and harness, all contained in one loom frame. The machines may make one or more patterns at the same time, according to the scheme of harness draft, or patterns cut on the Jacquards employed.

THE ELASTIC WEB LOOM.

If to this complex mechanism are added two new elements, one may imagine the intricacy of the elastic web loom. One of these requisites is the introduction of the rubber thread warp, woven under a very high tension, bound or woven in between two distinct cloths, often of different colors and texture, in such a way as to hide the rubber threads completely. The other requisite is the complicated arrangement of the harness, so as to produce in the weaving two distinct cloths, an upper and a lower, so bound together as to weave the stretched out rubber thread between them, thus affording it protection against exposure, wear and tear.

The rubber threads are handled in the loom in the same way

as the yarns in the warps, but it is necessary that they be woven under tension, otherwise there would be no contraction of the fabric after it is woven, and therefore no elasticity. This matter of tension is important, and requires careful adjustment, according to the amount of elasticity desired. This is accomplished in a comparatively simple manner. The rubber threads are wound tightly upon a large spool or beam at the back of the loom, and from this they are run through reeds and harness. To retard this thread, so that it goes through the loom at a tension, various kinds of brakes are used, which automatically regulate the feed.

SUSPENDER LOOMS.

Perhaps the most complicated looms for these fabrics are those used for the manufacture of suspender webs. Such webs are made with various patterns in the weave, and in a variety

shade and color of yarns are employed, of sizes ranging all the way from 10/2 to 100/2.

WEAVING FANCY SUSPENDER WEB.

The loom shown in Fig. 1 is a popular type used for the manufacture of fancy suspender webs. It combines great capacity for elaboration of design with high speed of operation. This loom was introduced about 1875. Up to that time all fancy effects made in elastic webs were produced on jacquard looms, which were necessarily slow running and complicated to operate, thus making the goods very expensive. The jacquard machine has been largely superseded by the fancy head loom.

With the fancy head it is possible to operate as high as 25 harness, and the length of the design is governed by a chain of any length, so that a large scope of figures is obtainable. This does not in any way interfere with the speed and production of the loom. Another feature of this machine is the differential take-up gears which feed the web down through the press rolls as it is woven. This consists of a series of boxed-up gears, so arranged that by a simple movement the feed can be made either fast or slow, without the change of any gear, as is necessary with the ratchet take-up.

Another loom shown in Fig. 2 is a 24-piece, straight shuttle, end-cam suspender loom. Instead of the movements of the harness being controlled by cumbersome and almost inaccessible cams and their shaft running through the entire loom with its tangled mass of wires connected to the cam levers and the harness, there is a small set of end cams and cam jacks with wires running over pulleys set in the main arch of the loom frame, direct to the harness. These cams, which are seen on the right end of the machine, are easily accessible for adjustment and repair, and are very simple of operation. Great improvement has also been made in the press rolls, which are not only much more simple and compact than formerly, but where operation is controlled positively by ratchet take-up gears, fixed at the end of the loom, and which can be easily changed to accommodate to any desired feed. Perhaps the greatest change and improvement lies in the introduction of the warp levers, which automatically control the let-off of the cotton warp beams, doing away with the old-fashioned method of letting down the weighted pulley blocks. Such a loom is adapted for making all plain and twill goods, and can be run at a speed of about 160 picks per minute, producing about 2,000 yards per week.

When the webs are woven they are automatically wound upon rolls at the looms, from which they are removed in lengths of about 200 feet, the cuts generally being made at a place where a new lot of rubber or yarn has been started.

FIG. 2.—SCHAUM & UHLINGER SUSPENDER LOOM.

of color designs for ornamental purposes. Most of the looms carry about 24 shuttles, and make simultaneously that number of webs, all of one pattern. Some looms have shuttles that move in a semi-circle, rather than a straight reciprocating motion, which saves much space, and allows about 36 shuttles to work in the same length of loom as 24 laterally moved shuttles. Again, there are some looms which have only three shuttles. Each of these schemes has its advantages. When a thread breaks the stopping of a loom for its repair may delay 24 or 36 shuttles, but only 3 in the smaller machine, although one operator can oversee more webs on the larger loom than on a multiple of the smaller. The webs are mostly made between 1½ and 2 inches wide, and contain from about 15 to 38 strands of different sized rubber. Some webs, called "truss webs," have an extra thickness of fabric on the back to protect the rubber strands from perspiration, for this emanation is especially destructive.

Some suspender webs have a surface design overshot with silk in various colors; and these necessitate in some cases the use of 15 or 18 harness frames, and the employment of special devices to regulate the warp threads as the shuttles carry the colored silks across. Every conceivable

FIG. 3.—MACHINE FOR FINISHING ELASTIC WEBBING.

BURLING, SINGEING AND FINISHING.

As the web comes from the loom, there is more or less lint adhering to it. In some factories this is removed by passing the web through a burler. This machine is a combination of

brushes and a rapidly revolving knife, which delivers the goods smooth and clean.

A very complete machine for finishing elastic webbing is shown in Fig. 3. The webbing is run through the machine just as it comes from the loom. It first passes between a pair of brushes, *A*, which remove the lint and loose threads. From the brushes the webbing passes over tension bars *B*, having guide fingers for feeding the fabric between a pair of nip rollers, *C*, which hold it at a proper tension. The webbing then passes through a long box, *D*, for sizing or starching, the surplus sizing being squeezed out by a second pair of nip rollers, *E*. From this point the webbing passes over six steam-heated copper cylinders, *F*, and through delivery rollers, *G*, to the winding-up reels. The upper deck of cylinders, *F*, may be driven at the same speed

FIG. 4. KNAPP SINGEING MACHINE.

or faster than the lower deck, so that the webbing is allowed to shrink as much as desired. The delivery rollers, *G*, may be driven at varying speeds for obtaining a slight polish on the webbing.

Some goods are subjected to a singeing process for the removal of lint. The machine shown in Fig. 4 is very generally used for singeing elastic webbing and shoe goring. The goods are singed on both sides at the same time, and are brushed both before and after singeing. The machine has an automatic device which removes the burners from contact with the goods when the mechanism stops, so that the fabric cannot be injured. Water rolls are employed as an additional precaution against injury.

The atmospheric condition has an influence on the rubber thread while weaving, and sometimes the fabric comes out in a more or less kinky condition. It therefore becomes necessary to finish it, which is done by first passing the webs through live steam, which has the effect of softening the outer cloth, and allowing the elastic more power to contract, thus increasing its elasticity. Then a size is applied, and the web run over heated drums, which, dry the fabric and deliver it from the calender smooth and straight. It is then coiled in rolls as it leaves the machine, and if the web is then found to be long-sided or crooked, such rolls are steamed and placed on a heated plate until corrected. The webs are then inspected, measured and labeled, and stored in a dark, cool cellar until needed for the market.

A COMMERCIAL REPORT FROM BUCHAREST STATES THAT THERE is a great and urgent demand for rubber-soled sport shoes and general rubber goods in Rumania.

MEETINGS AND BANQUET OF MOTOR AND ACCESSORY MANUFACTURERS ASSOCIATION.

AT THE FIRST MEETING of the 1920 Board of Directors of the Motor and Accessory Manufacturers Association held January 8, officers were elected and committees appointed for the new year.

With one exception the 1919 officers were reelected. Thomas J. Wetzel, one of the retiring members of the board of directors, is succeeded as secretary and assistant treasurer of the association by G. Brewer Griffin, Westinghouse Electric & Manufacturing Co., New York City, a new addition to the board.

Considerable changes were made in the makeup of the various committees of the board of directors, but the chairman in each case remains the same. The names of the officers and directors follow:

OFFICERS FOR 1920.

C. E. Thompson, president, Steel Products Co., Cleveland, Ohio.

E. H. Broadwell, first vice-president, The Fisk Rubber Co., Chicopee Falls, Massachusetts.

Christian Girl, Standard Parts Co., Cleveland, Ohio.

W. O. Rutherford, The B. F. Goodrich Co., Akron, Ohio.

L. M. Wainwright, treasurer Diamond Chain & Mfg. Co., Indianapolis, Indiana.

G. Brewer Griffin, secretary and assistant treasurer, Westinghouse Electric & Manufacturing Co., New York City.

BOARD OF DIRECTORS.

C. E. Thompson, Steel Products Co., Cleveland, Ohio.

E. H. Broadwell, The Fisk Rubber Co., Chicopee Falls Massachusetts.

Christian Girl, Standard Parts Co., Cleveland, Ohio.

W. O. Rutherford, The B. F. Goodrich Co., Akron, Ohio.

L. M. Wainwright, Diamond Chain & Manufacturing Co., Indianapolis, Indiana.

G. Brewer Griffin, Westinghouse Electric & Manufacturing Co., New York City.

E. E. Allyn, Aluminum Manufacturers, Inc., Cleveland, Ohio.

E. W. Beach, Ferre Machine & Foundry Co., Cleveland, Ohio.

G. W. Yeoman, Continental Motors Corp., Detroit, Michigan.

E. P. Hammond, Gemmer Manufacturing Co., Detroit, Michigan.

J. M. McComb, Crucible Steel Co. of America, Pittsburgh, Pennsylvania.

A. W. Copland, Detroit Gear & Machine Co., Detroit, Michigan.

Following the annual meeting on January 7 the Association held its banquet in the Grand Ball Room of the Commodore Hotel. Approximately six hundred men were present. The entertainment program consisted of an all-star vaudeville bill, together with a number of other unusual features, including the first photoplay production of the association. It was a one-reel showing of "Our Own Topics of the Day," presented for the first time on any screen, and plotted, planned and produced for the entertainment of the Association.

THE PHILIPPINE ISLANDS AS THE SOURCE OF AMERICA'S FUTURE crude rubber supply is predicted by foresighted men of the rubber industry. In a recent statement, F. A. Seiberling, president of The Goodyear Tire & Rubber Co., declared that if importation of cochie labor was allowed in the Philippines, enough crude rubber would be produced to make America independent of relying on importations from other countries.

IT WAS ANNOUNCED LATE LAST MONTH THAT HARRY S. VORHIS, OF the Gutta Percha & Rubber Manufacturing Co., New York City, has been appointed general manager of the Mid-West Rubber Manufacturers' Association, and will take charge February 1.

What the Rubber Chemists Are Doing.

VARIABILITY IN PLANTATION RUBBER.¹

AT THE CENTRAL RUBBER STATION a number of samples of the ordinary output of estates in the Netherlands Indies are regularly tested. The review of this work by O. de Vries and W. Spoon is outlined in abstract as follows.

TENSILE STRENGTH.

The differences in tensile strength between smoked sheet and crêpe are inconsiderable. A real intrinsic difference in tensile strength between sheet and crêpe, tested in a strictly comparable manner, is hardly to be expected, as the difference in their preparation does not affect the tensile strength. Even the greater degree of milling in the preparation of crêpe in ordinary estate practice does not affect the tensile strength, the young rubber, still wet, regaining its strength completely, in contrast with excessive plasticising of older, dry rubber which often becomes heated in the process and loses tensile strength.

There is a marked difference in tensile strength in rubbers from different estates. As to the causes of the deficiency in this respect, our knowledge is still incomplete. The already known factors in preparation (excessive heat; tackiness, caused by copper salts; sunlight or lower organisms; growth of molds resulting in violet-colored spots in crêpe; use of some chemicals, as sulphuric acid or alum in coagulation) cannot give an explanation in such cases. Other known causes, such as latex from young trees, or excessive tapping of trees that will have to be thinned out, also do not always offer a sufficient explanation. It may be possible that soil, climate, or hereditary factors (strain of seed) play a rôle—factors which it would be very difficult to eliminate, so that a uniform high tensile strength for all estates cannot be reached at will.

SLOPE.

"Slope" is the stretch produced by a certain load at high elongations (determined after the method of Schidrowitz). A low figure for slope denotes a rubber with a great resistance to stretching at high elongations. The slope shows a relation to permanent set.² The average figures for slope of the samples tested in 1917 and 1918 are:

	1917.	1918.
Smoked sheet	37.2	36.5
Crêpe	35.9	35.5

Smoked sheet averages somewhat greater slope than crêpe. The variation in both grades is not large, nearly all samples falling between 34 and 39, while the ordinary figures for crêpe are 35-37 and for smoked sheet, 36-38. Whether this difference is of any practical importance in the comparison of first-grade samples will have to be investigated. The large deviations in slope are found in the lower grades, where the characteristic becomes typical.

RATE OF CURE.

The authors' "standard time of cure" in testing is the time necessary to bring the stress-strain curve to standard position (length 900 per cent at 1.30 kilograms load).

The rate of cure is the property that has drawn the greatest amount of attention from most investigators, and certainly there was reason for it. It should, however, be stated clearly that the quality of the product in the strict sense of the word is expressed by tensile strength and slope which represent intrinsic properties of the rubber, while rate of cure is a property of more or less accidental nature. Faults in this respect cause trouble to the manufacturers, but are not irreparable, while shortcomings in tensile strength (in the sense of maximum tensile strength as we determine it) or slope cannot be remedied.

For 1917 and 1918 the average figures and the normal values of smoked sheet and first-quality crêpe have remained practically the same. The time of cure for smoked sheet is nearly 20 minutes shorter than that for crêpe, while the variability is $1\frac{1}{4}$ to twice as great. The same difference in standard time of cure (20 minutes) was found for smoked sheet and crêpe prepared from one lot of bulked latex, while for unsmoked sheet the time of cure was 29 minutes shorter.

The factors causing variability of line are: (1) composition of latex; (2) chemicals added; (3) changes in the non-rubber constituents; (4) smoke constituents and decomposition products formed by heating. The adoption of standard methods of rubber production is most important. Bulking of the largest possible lots of latex is one of the first needs to obtain a uniform product.

VISCOSITY.

As our knowledge now stands, viscosity determination in general cannot be used to judge of the properties after vulcanization, but supplies very useful figures to give an indication as to the cause of deviations. A fairly uniform rate of cure may be accompanied by rather large oscillations in viscosity. The explanation is that the estate prepares smoked sheet after standard methods but uses a so-called Barker smoke-house in which temperature may vary considerably, causing deviations in viscosity. Uniformity in viscosity does not insure uniformity in rate of cure and tensile strength, owing to factors causing a greater rate of cure and higher viscosity by incipient maturation.

A change in viscosity that accompanies a deviation in rate of cure may indicate whether the cause is to be looked for in errors or irregularities in the preparation, or in changes in the latex (condition of the trees) and may give very useful indications for controlling the methods of preparation on the estates and the properties and uniformity of their output.

EFFECT OF SOAKING COAGULUM IN WATER.

Dr. O. De Vries has reported in the Communications of the Central Rubber Station³ the results of his investigation of the effect produced on the properties of the rubber by soaking the rolled or unrolled coagulum in water.

(1.) The general effect of soaking the coagulum, rolled or unrolled, in water is, in the first place, to cause an extraction of serum substances, a loss in weight in the dry rubber, and a decrease of cure. When kept in water a longer time, maturation sets in, which causes a further loss in weight, while the rate of cure increases and the original retardation diminishes or changes into an acceleration. The accelerators form in spite of the fact that a considerable part of the serum substances has been first removed by the water.

(2.) The loss in weight by soaking amounts to 0.2 to 0.4 per cent for crêpe; $1\frac{1}{2}$ to 3 per cent for sheet, and 0.2 to 2 per cent for unrolled coagulum, according to hardness of coagulum, duration and intensity of extracting, etc.

(3.) Crêpe rubber that has so abundantly been treated with water during rolling, shows practically no change when soaked in water for a few hours after rolling.

(4.) Soaking freshly rolled sheet rubber in water has a more marked effect, which is considerable when the sheets are kept in water from $\frac{1}{2}$ to five hours. Extraction for $\frac{1}{2}$ -hour gave, on the average, an increase of 13.45 per cent in time of cure, while for one to five hours gave average figures from $17\frac{1}{2}$ to 25 per cent. Keeping in water a night causes the rate

¹O. de Vries and W. Spoon, "Archief voor de Rubber Cultuur," July, 1919, page 266.

²"Journal of the Society of Chemical Industry," volume 36, page 125.

³"Archief voor de Rubber Cultuur," September, 1919, page 369.

of cure to increase again, the average decrease is only 16 per cent; keeping in water for 48 hours gives a still smaller decrease, on the average 11.7 per cent. The maturation gradually tends to equalize the effect of the extraction of serum substances, and freshly rolled sheet kept seven days under water shows a time of cure of 55 minutes, nearly that of matured rubber.

(5.) Soaking sheet rubber in water does not prevent rustiness.

(6.) Keeping the freshly rolled sheets in water for some time is of prime importance, not only to prevent the cases of greasiness (hydropscopic serum substances on the surface of the sheet), but to diminish the tendency to moldiness.

(7.) Keeping the unrolled coagulum in water gives similar results, but the effect differs with the thickness and hardness of the coagulum.

The simplest way to prevent rustiness in actual estate practice is to take care that the surface of the sheet dries so rapidly that the micro-organisms, that grow only on the surface exposed to the air and need moist surroundings, have no time to develop.

CONCLUSION.

The defect called "rustiness" in sheet rubber is not caused by a film of serum-substances, notably proteins, dried on the surface of the sheet, but it is formed by decomposition of the serum-substances by an aerobic micro-organism.

THE CAUSE OF RUSTINESS IN SHEET RUBBER.

In the Communications of the Central Rubber Station,¹ H. J. Hellendorn discusses the causes of rustiness in sheet rubber, summarizing his experiments as follows:

In experiments in the laboratory and on estates, rustiness was always produced at will by keeping the freshly rolled sheets for some time, 24 or 48 hours, in a moist atmosphere. The degree of moisture of the atmosphere in which the sheet hangs shortly after rolling, is of the greatest importance. Sheets taken immediately after rolling into a drying room of higher temperature (40 to 60 degrees C.) never show rustiness, while air drying at room temperature produces rustiness during periods of wet weather.

When coagulum is kept in the dishes some time after coagulation, as over night, the side of the sheet that corresponds to the upper part of the coagulum—the layer that was exposed to the air, shows rustiness to a larger extent than the lower parts of the coagulum. The explanation is that on the surface of the coagulum the infection, and perhaps a growth of the aerobic micro-organisms may start earlier.

Rustiness can be prevented by disinfecting the surface of the freshly rolled sheet by soaking it for some time in dilute solutions of formalin, chinolol, or bisulphite. The same disinfecting effect may be produced by keeping the freshly rolled sheet for some time in the vapors of boiling water, or by immersing the sheets in hot water (60 degrees C.) This is the well known method formerly used to prevent rustiness and surface oxidation by enzymes.

The micro-organisms causing rustiness are aerobic; that is, they need air for their growth and do not thrive where the air cannot penetrate. For instance, when a freshly rolled sheet is tightly rolled up and placed in a moist atmosphere, only the parts exposed to the air develop rustiness, while the parts of the surface that stick together, so that the air cannot penetrate, remain free of rustiness. Like all micro-organisms, those causing rustiness have an optimum temperature (about 40 degrees C.).

The thin layer of serum-substances that remains on the sheet after most of the serum has dripped off, or the by-substances

absorbed by the rubber, form the sources of nourishment for the micro-organisms. Dilute serum seems to be preferred to the undilute. Soaking the sheets in water after rolling, so that a great part of the soluble serum-substances is removed, does not prevent rustiness. In fact, under favorable circumstances rustiness develops on such sheets to a much larger degree. It is well known to planters that when sheets are soaked in water and the dilute serum so formed is kept for some time, a jelly-like substance develops, as if some grease or fat had been extracted from the sheets. This jelly-like substance is probably closely related to the substance forming the film of rustiness.

The question is of some practical importance whether smoke forms a sufficient disinfectant to prevent the growth of the organisms causing rustiness. Wet sheets hung in a smoke house at a somewhat elevated temperature and without much ventilation would be under favorable conditions for the development of micro-organisms, unless the smoke acted as a preventive. It seems that smoke does hinder the formation of rustiness under such circumstances to some extent, but does not wholly prevent it; and especially in places where the smoke does not penetrate so easily, for instance, near the sticks, or in places where two sheets come very close together, rustiness may develop. If care is taken that the sheets air-dry rapidly, so that they are sufficiently dry when they are placed in the smoke house, the disinfection by smoke is of no further importance.

DETERMINATION OF IRON AND ALUMINUM.

By C. B. Clarke.

The following is a method for the quantitative determination of iron and aluminum in ignited mixtures containing much greater amounts of alumina than ferric oxide.

The finely divided oxides are intimately mixed with acid potassium fluoride in a platinum crucible. The mixture is fused over a small flame until, after a few minutes, it becomes solid. Dilute sulphuric acid is then added, and the greater part of the hydrofluoric acid expelled by heating for a short time. The sulphates are then dissolved in water in a platinum dish; the iron is reduced by sulphur dioxide, the excess of which is expelled by carbon dioxide, the liquid is then titrated with permanganate of potassium in a Jena glass beaker.

In one analysis by this method, in which 0.007-gram Fe_2O_3 was present in 0.094-gram of mixed oxides, 0.0065-gram Fe_2O_3 was found.

The presence of considerable quantities of potassium hydrogen fluoride does not interfere with the titration.

The advantages of this method over that of fusing with potassium bisulphate are that no platinum passes into solution, and that it is much quicker.

INFERIOR GRADES OF RUBBER.

Dr. A. J. Ullé² has investigated the inferior grades of rubber to determine whether, besides the differences in external appearances, the internal qualities of such kinds of rubber show any difference. For this purpose the viscosity and the percentage of ash were ascertained from samples of pale and dark scrap of the same estate. The dark scrap gave a lower viscosity figure (averaging 97 against 113 for pale scrap) and a higher ash per cent (averaging 0.68 against 0.51 for pale scrap).

MAXIMILIAN TOCH, of TOCH BROTHERS, MAKERS OF CHEMICALS and technical paints, has been appointed Adjunct Professor of Applied Chemistry at Cooper Institute, New York City, where he will give a course on the chemistry of india rubber.

CHEMICAL PATENTS. THE UNITED STATES.

PRODUCING RUBBER SYNTHETICALLY. The process of changing limonene into a rubber-like substance, which consists in bringing the limonene into contact with metallic sodium. (Louis Gottschalk, Rahway, New Jersey; Esther Gottschalk, administratrix of Louis Gottschalk, deceased. United States patent No. 1,323,589.)

SEALING COMPOSITION FOR CANS, consisting of crude rubber, benzol, beeswax, paraffine wax, and talc powder in proportions set forth. (Austin Gilbert and Charles E. Vander Hoof, assignors to the Fischer Can Co.—both of Hamilton, Ohio. United States patent No. 1,323,752.)

VULCANIZATION PROCESS AND PRODUCT. A product made by incorporating a product of hydrolytic decomposition of a proteid and heating the resultant mixture with a vulcanizing agent to effect vulcanization. (Clayton W. Bedford, assignor to The Goodyear Tire & Rubber Co.—both of Akron, Ohio. United States patent No. 1,323,951.)

PROCESS OF RECLAIMING RUBBER, comprising treating simultaneously the vulcanized material in proper condition and under heat and pressure with a devulcanizing agent comprising xylol and aniline in the presence of a substance capable of combining with or absorbing sulphur. (John Young, Akron, and Winthrop W. Benner, Cuyahoga Falls, Ohio, assignors to the Firestone Tire & Rubber Co., Akron, Ohio. United States patent No. 1,324,093.)

COATED FABRIC, comprising a sheet of fabric having a base coating containing rubber and a surface coating containing nitrocellulose. (Clarence Weare Howlett, Kokomo, Indiana, assignor to E. I. du Pont de Nemours & Co., Wilmington, Delaware. United States patent No. 1,324,154.)

LEAKPROOF COMPOSITION FOR TIRES, a composition for filling the walls of tire tubes. A mixture of about 16 parts of mineral wool to one of a mixture of gelatine and soap in proportion of about two of gelatine to one of soap and two ounces of the mixture mixed with a quart of water. (Arthur W. Swanberg, Minneapolis, Minn., assignor to Waldo B. Berryman, Lima, Ohio. United States patent No. 1,326,007.)

RUBBER AND METHOD OF OBTAINING IT by incorporating therewith sulphur, titanic oxide, zinc oxide, a black carbon pigment, and an accelerator of vulcanization other than titanic oxide, and vulcanizing the mixture. (Louis E. Barton, Niagara Falls, New York, and Henry A. Gardner, Washington, D. C., assignors to The Titanium Alloy Manufacturing Co., New York City. United States patent No. 1,326,319.)

VULCANIZED LEATHER SUBSTITUTE. Formed of a composition of matter composed of an excess by weight of rubber, and an excess by bulk of cork particles in combination with a fibrous material, reclaimed rubber, sulphur and glue. (Justus W. Matthea, Ingram, assignor to Armstrong Cork Company, Pittsburgh—both in Pennsylvania. United States patent No. 1,326,681.)

THE UNITED KINGDOM.

REGENERATED VULCANIZED RUBBER is secured by first pulverizing the material, then heating it in a vacuum or in the presence of an inert gas with continuous agitation, such as carbon dioxide or nitrogen, the temperature being such that fusion of the mass does not occur, and then when the heated mass is sufficiently plastic, suddenly cooling it by spreading on a cold stone or by projecting it into cold water or into a solution of sodium carbonate, caustic soda lye, or other liquid. (B. J. F. Varenhorst, 25 Jacob Gillesstraat, Haag, Holland, British patent No. 133,369.)

THE DOMINION OF CANADA.

RUBBER COMPOUND of improved toughness, consisting of mixing on heated rolls rubber, vulcanizing material, thin roughened flakes of tough, durable, flexible, resilient material (such as fish scales) and then vulcanizing the mixture. (Niels D. Nielsen, Elyria, Ohio. Canadian patent No. 194,716.)

RUBBER FABRICS. A compound integral rubber fabric comprising a stratum of moldable elastic rubber and a stratum of highly fiberized moldable rubber compound vulcanized together. (Gutta Percha & Rubber, Limited, assignee of John McL. Ogilvie, Toronto, Ontario, Canada. Canadian patent No. 195,326.)

LABORATORY APPARATUS.

SAFETY VALVE FOR DISTILLING FLASK.

A VERY USEFUL SAFETY VALVE of interest to chemists is shown here as described by E. Rittenhouse in "The Journal of Industrial and Engineering Chemistry," August, 1918, page 633. The valve is intended for use in a distilling flask when determining ammonia by absorption in standard acid solution. It will prevent the acid from going up into the flask by letting air in and breaking the vacuum. The valve is made entirely of glass, with a drop of mercury in the bulb. It is very effective, never sticking, always set. The principle, namely, the pressure due to a column of mercury, can be adapted to all low-pressure work, both above and below that of the atmosphere.

THREAD COUNTING MICROMETER.

In rubber works control laboratories handling textiles, the need has long been felt for a better instrument than the ordinary pocket linen counter in common use. This need has been well met by the Lowinson thread counting micrometer shown in the illustration.

The instrument includes a triangular scale, which can be instantly adjusted to provide an inch measure (four quarters), a linen measure, a millimeter measure, and the decimal parts of an inch. Being made of polished steel, each scale reflects the light upon the fabric beneath the lens. Greater stability is afforded by placing the knob, which, upon being moved by the finger, moves the index within, instead of outside, the frame of the instrument. By a disengaging device the index can now be quickly moved to any place on the scale. To facilitate the counting of even the finest fabrics a lens of unusually high power is provided. (Charles Lowinson, Inc., 366 Fifth avenue, New York.)

THREAD COUNTER.

The Expansion of Rubber Compounds During Vulcanization.¹

By C. W. Sanderson.

THE EXTENT to which rubber compounds will expand when subjected to the heat of vulcanization is of importance in the molding of rubber goods. As far as published results go, however, there are no available data on the value of the coefficient of expansion of rubbers of different compositions.

FIG. 1. RUBBER EXPANSION APPARATUS.

The work was undertaken by us primarily from a practical point of view, with the object of determining whether or not use could be made of an expansion test in distinguishing between stocks which move freely and mold well and those which do not mold well and are characterized as being "dead." Other possibilities suggested themselves and although the results are by no means complete or beyond question, they are set forth as we have found them.

APPARATUS.

A special apparatus was designed for the investigation (Fig. 1). It consists of a hollow steel cylinder which may be filled with rubber and which is surrounded by a steam-jacket. The top surface of the rubber is the only surface free to move when the rubber is heated, and it acts against a piston and spring. The motion is transmitted through a magnifying lever to a recording pencil. The piston, spring and recording mechanism were taken from a Crosby steam indicator gage and made over to fit the apparatus. Above the piston is a place for a spring to keep

FIG. 2. CURVE SHOWING EFFECT OF FILLING RUBBER ON RATE OF EXPANSION 1608 FINE PARA TO 1608 BROWN CRÉPE.

pressure enough on the rubber so that it will not "blow." Ten, 50 and 100-pound springs were used. The ten-pound spring was hardly strong enough to prevent blowing. The use of the 50 and 100-pound springs will be mentioned later.

¹Published by courtesy of the American Chemical Society. Paper read before the Rubber Division of the American Chemical Society, at Philadelphia, Pennsylvania, September 4, 1919.

In making the determinations of the expansion the rubber was heated at a constant rate, usually 20 degrees per five minutes. The recording cylinder was advanced at each interval and from the values on this graph smooth curves could be drawn.

The dimensions of the steel cylinder were: diameter, 0.9798-inch; height, 2 inches.

These dimensions were chosen so that at room temperature (80 degrees F.) the volume of the contained rubber was one cubic inch. The motion of the recording pencil was reduced to the motion of the piston by dividing by six.

The cubical coefficient of expansion, derived from the regular forms, may be expressed in simplified form if we neglect the expansion of the steel shell and approximate.

$$\text{Thus, } a = \frac{x}{12t}$$

where t = temperature change and x = expansion recorded on the chart.

It was found that the differences in the results obtained with

FIG. 3. CURVE SHOWING EFFECT OF MILLING ON RATE OF EXPANSION.

the exact and with the approximate formula were less than the experimental errors. The approximate formula was therefore used in our work.

²Stock 153, 10^{-4} .

³Formula constant same as table, 4.6×10^{-4} .

In general the results show that the higher the rubber content, the higher the coefficient of expansion. It is, however, difficult to show any definite relation because, as will be shown later, other factors enter in.

NATURE OF THE EXPANSION.

The graphs obtained showed that after the first fifteen minutes the expansion curve was practically a straight line. The beginning of its curve showed a lower slope because of the fact that the rubber was not thoroughly heated through or perhaps

had not been put in so as entirely to fill its cavity. Therefore, all measurements taken to determine the value of the coefficient were taken over the range of 100 degrees to 300 degrees. Some of the lower grade compounds, especially those with high sulphur contents, showed a lessening of the slope and even a falling off in the curve after 300 degrees had been reached.

INFLUENCE OF THE RUBBER.

Two samples were made up from the same formula, using in one fine hard Pará and in the other a soft grade of brown crêpe (Fig. 2). Each was subjected as nearly as possible to the same amount of milling. The Pará sample gave a coefficient of 2.337×10^{-4} , while the brown crêpe gave 4.49×10^{-4} .

INFLUENCE OF THE MILLING.

Other parts of the same batch with the Pará rubber were subjected to further milling and a sample gave a coefficient of 4.680×10^{-4} , while another sample which had been milled to excess on hot rolls gave a value of 4.786×10^{-4} (Fig. 3). Then it is seen that milling increases the expansion and brings the value of Pará up to that for the brown crêpe.

VOLUME CHANGE AT CONSTANT TEMPERATURE.

One of the first questions which arose in connection with the expansion of the rubber was whether or not there was a break in the curve or, in other words, a volume change at the point of vulcanization. We know that a physical change takes place and that the specific gravity increases and therefore it was only natural to look for a drop in the expansion. The curves obtained with a rising temperature failed to show any drop, so samples were tried using a constant temperature, in other words, subjecting the sample to the same condition as an ordinary cure (Fig. 4). The graphs failed to show any drop with the exception of the cases already mentioned. Even in those cases

occurs must come as the result of the pressure and the subsequent contraction on cooling. Since rubber is nearly incompressible, the decrease must come as the result of the squeezing of air out of the raw rubber. If this be true, then a compound

FIG. 5. CURVE SHOWING EFFECT OF DIFFERENT PRESSURES ON TWO RUBBERS, ONE OF WHICH SHOWS A LARGE AND THE OTHER A SMALL DIFFERENCE BETWEEN RAW AND CURED SPECIFIC GRAVITIES.

showing a big difference between raw and cured specific gravity will expand more against a slight spring than against a strong one. This was tried out and found to be the case (Fig. 5).

STOCK.	EXPANSION AGAINST SPRING.			
	50-lb.	100-lb.	50-lb. spring.	100-lb. spring.
1520	3.81×10^{-4}	3.81×10^{-4}		
355	2.17×10^{-4}	1.36×10^{-4}		

STOCK.	SPECIFIC GRAVITIES.			
	RAW.	CURED IN HYDRAULIC PRESS.	CURED IN EXP. APPARATUS.	
1520	0.95	0.957	0.956	0.956
355	1.457	1.568	1.568	1.577

EXPANSION VS. CONTRACTION.

The increase in specific gravity shows that the contraction is greater than the expansion. Therefore the question arises whether or not the values obtained apply to the cured rubber. In order to determine this, measurements were made on samples cured in a disk mold.

Aluminum mold	1595 stock
Diameter of mold hot	$\frac{3}{8}$ inches
Diameter of rubber cold	$\frac{3}{16}$ inches

$$L_t - L_o = 0.0625$$

$$L_o = 39063 (218)$$

$$\alpha = 0.00007339$$

$$a \text{ (cubical)} = 2.20 \times 10^{-4}$$

This compares with 2.8×10^{-4} obtained the other way. This is a check considering the fact that the rubber was of a different sample and was from mill stock, while the expansiometer sample was from calendered stock. The conclusion may be drawn then that the coefficient determined between 200 degrees and 300 degrees be taken as sufficiently accurate for the coefficient for vulcanized rubber from the same sample.

CONCLUSION.

Although it is not yet possible from the results obtained with this apparatus to state definitely whether or not a stock will mold well in factory practice, it does give us a means of distinguishing between batches of the same stock which may have different properties, due either to rubber milling or other conditions.

The results may be summarized as follows:

- I. The values of the coefficient of cubical expansion for different grades of rubber have been determined.
- II. The higher the rubber content the greater the expansion.
- III. The harder the crude rubber the less the expansion.

FIG. 4. CURVE SHOWING EXPANSION AT CONSTANT TEMPERATURE.

the drop was very gradual and did not start at the point of vulcanization. Therefore, the method could not be used as a method of regulating or determining the cure of a sample of rubber.

Since the curves failed to show any volume contraction during the heating process, the increase in specific gravity which always

IV. The more the rubber is milled the greater the expansion.
V. There is no break in the expansion at the point of vulcanization.

VI. The increase in the specific gravity is caused by the pressure and not by physical change or internal contraction of volume.

FOUNTAIN PEN INK SACKS.

THE MECHANICAL perfection of fountain pens has enhanced their utility and convenience to the extent that their acceptance as a writing instrument is well nigh universal. As a result their manufacture has become a highly specialized and important branch of the rubber industry. The hard parts of the appliance, except the gold point, are made of high-grade vulcanite capable of rapid and accurate machining. The production of these parts has been reduced to highly efficient machine shop practices, in which sixty or more distinct operations are involved.

The well-known self-filling feature of fountain pens depends on the use of a rubber collapsible bag filling the pen barrel and serving as a reservoir of ink. It is connected with the ink-feeding device and so arranged that the user may expel the air from the bag by collapsing it and, by thus causing a vacuum, draw in the ink supply.

These soft rubber ink sacks are hand-made, requiring some deftness in manipulation in their manufacture. Briefly, calendered sheets of Para rubber compound of good quality are coated on ribbed holland cloths for the production of a ribbed effect on the rubber. This ribbing in the finished bag serves as a support to maintain the cylindrical form when the sack is only partly filled.

Although the corrugations on the sheet from which the sacks are made are usually produced as described above, there are other ways of doing it. For example, engraved rolls in connection with a calender are sometimes used, or impression plates of vulcanized rubber are substituted, the calendered sack sheet being placed upon the engraved plates and pressure applied until a definite ribbing is effected.

From the calendered sheet, short length strips are cut crosswise of the ribbing. These are formed into tubing of the required size by hand-drawing through a die which unites the edges in a perfectly tight joint. Sections of this tubing are cut, slipped over suitable forms and, by means of sharp scissors, cut to fit the taper of the form at one end and the hemispherical end of the other, these cuts being formed into tight joints by the thumb-nails of the operator.

Instead of drawing the sheet through a die, the sack stock may be furnished in continuous lengths by being run through a tubing machine. There is another way: After the pieces have been died into blanks of the proper width, the edges are cemented and seamed by hand, the thumb-nails of the worker finishing the seam. In a third process a hammering machine strikes the two edges together, causing them to adhere firmly.

The sacks are then packed in pans of soapstone and vulcanized in open heat. In making these sacks in quantity, the metal "formers" over which they are made are assembled by the hundred on boards, each "former" standing on end in a little hole let into the board.

In removing the sack from the "formers" after vulcanization, they are turned inside out to get them off, which leaves the corrugated surface on the inside. They are turned back, cleaned for a short time in a tumbling barrel, counted by weight, and are then ready for shipment.

SELECTING SERVICE MANAGERS.

By Adrian B. French.

THE DUTIES of a service manager are of such a nature that he can almost be termed a "Trinity." He must be in a position to listen to the story that usually accompanies a claim for adjustment and handle the situation in such a manner as to produce a result fair to both his firm and the customer. It is not an easy matter to effect such a condition; types of persons differ in temperament and each one has to be handled differently; a constant psychological study is necessary to produce the best results. As long as rubber tires are manufactured, there will be adjustments to be made; tires may be adjudged perfect, after test, yet use is the final proof of the serviceability of the tire. It is almost a physical impossibility to produce a tire that will meet the demands of everybody, and hence arise conditions that are cause for adjustments. These conditions differ according to the nature of the service the tire is asked to perform, as do also the class and conditions of roads over

which it has to travel. I No manufacturing process can anticipate these things. The service man has to be on the jump all the time to get at real facts and has to be careful to keep the customer "coming." He must therefore be the first of the trinity—a diplomat.

Tires are manufactured according to the best methods and with the best material obtainable, and workmen are trained to turn out the best possible work. There is represented in every tire put on the market the best possible

of all elements that enter into its makeup. In order to know when a tire is good, it is necessary to be familiar with its manufacture. This is not to be learned by tearing a tire to pieces to find out what is in it, but by knowing how it is put together from the start to the finish of its process of manufacture. With this knowledge, intelligent adjustment of tires is made possible in connection with detecting the presence of physical defects. The service man must therefore be in a position to size up a tire and discover these things. In this regard he must be the second of the trinity—a tire maker.

In dealing with adjustments service men are continually confronted with the situation of "the customer." It is to his interest to serve him conscientiously and fairly and at the same time protect his company. At times he may have to deal with a customer who "has a grouch on," due to tire troubles. The branch wants that customer's name to remain on its books as long as his business yields a profit. The salesman who secured his business at the start started with a perfectly good tire with which to demonstrate his product; the service man starts with a tire a customer is claiming to be defective; he therefore has two things to accomplish, satisfy his customer on a basis of adjustment and also sell him a new tire. There is consequently a responsibility resting with the service man, that of being the third feature of the trinity—a salesman. And

SEAMING AND TRIMMING SACKS.

He has to be an accomplished salesman at times to hold a customer's business. As a rule, too little attention is given the Service Department by branch managers, and yet the Service Department can wreck a branch. It is as indispensable to the success of a branch as the product to be sold is. It is easy enough to sell a line of goods that as a general rule enjoys a good reputation; it is a different matter to deal with customers whose business in the Service Department is 100 per cent "condition to correct."

It is therefore indispensable that care be exercised in selecting the service man. He should be of good appearance, intelligent, quick to size up a situation, possess a knowledge of his product, be a diplomat and a salesman. He should be of the caliber that branch managers are made of.

A WORD OF CAUTION CONCERNING PNEUMATIC TRUCK TIRES.

By J. Newton Gunn.

THE PRESENT TENDENCY of tire manufacturers to recommend to truck operators promiscuous change-overs from solid to pneumatic truck tires leads me to offer a word of caution.

In my opinion the time has come when intelligent advice should be given to the truck owners of the country on this subject. There is reason to doubt whether truck owners in changing over indiscriminately from solids to pneumatics understand that such a change-over is not always satisfactory and may even be harmful to their trucks. The truth of the matter is that there are certain circumstances under which it is wise for a truck owner to use pneumatic tires and other conditions under which it is wise to continue to use solids.

The chief purpose in making this statement at this time is to prevent dissatisfaction to truck owners who, attracted by the success of the big pneumatics, may be contemplating discontinuing the use of solid tires and using pneumatic in their stead without inquiring into the suitability of the pneumatics for their trucks or their particular needs. It would be well for an owner to consult with a tire expert before making such a change.

A fact realized by few is that motor vehicles are built as a rule to meet the conditions imposed by the tires they are to carry. Most people regard tires as an accessory which have little influence on the structural design of the vehicle, but automotive engineers know that it is the tires which determine the general characteristics of the vehicle they are to carry. The development of the pneumatic tire was the chief factor in making possible the passenger car of to-day.

All except a few of the motor trucks in operation to-day were built from engine to rear axle along lines which would make them adaptable for use on solid tires. In designing these trucks, the sole object of the engineers was to secure the highest efficiency of operation possible under the limitations imposed by the natural characteristics of solid tires.

A small number of firms build trucks especially for pneumatics, but the number of makes of this sort is very limited. The number will undoubtedly grow rapidly, for the advantages of having a truck ride on air are so apparent that the demand for trucks designed for pneumatics cannot help but become great in the immediate future.

A truck designed for pneumatic differs radically from one built for solid tires. Truck and tire engineers are now working together to solve the problem of faster highway transportation and the solution is found in a truck specially designed to operate on pneumatic tires, having a chassis corresponding to that of a passenger car, an engine which will drive the vehicle at high speeds and still show the necessary economy in gasoline and oil, a rear axle and differential gears which will compensate for the larger outside diameter of the tires, and a braking system that is powerful enough to give the driver complete control of the heaviest truck under all conditions.

It is because most trucks are designed for operation on solids that truck users may find pneumatics unsuited to their requirements. If a truck designed for solids is changed over to pneumatic tires, the increased cost of this equipment can be most easily offset by increasing the radius of action; that is, increasing the speed. While the tires are designed for this, the engine, transmission, differential gears and brakes are not.

Another limiting factor that should be clearly borne in mind is that pneumatic truck tires have been satisfactorily perfected only in sizes up to 8 and 9 inches. Larger tires than this are still in the experimental stage.

There are some conditions under which it is wise to change over from solids to pneumatics, even though the truck construction contemplates the use of solids. There may be certain disadvantages as a consequence of the change, but these will be more than offset by certain advantages to be gained through use of the pneumatics. Because of the multiplicity of uses to which motor trucks are put, it is almost impossible to lay down any hard and fast general rule showing the conditions under which pneumatic tires should be used, or under which solid tires would be proper equipment.

Pneumatic tires have certain very definite advantages over solids. It is just as desirable to have all trucks operate on pneumatic tires as it is to have all passenger cars operate on pneumatic. The invention of the pneumatic tire was one of the greatest steps forward in the development of the passenger car, and the pneumatic tire for trucks is as great a step forward in the evolution of motor trucks. There is no doubt that ultimately pneumatics will be the standard equipment for practically all vehicles of this character.

TALC AND SOAPSTONE INDUSTRY.

America leads the world in the manufacture, use and production of talc and soapstone. According to the United States Geographical Survey the output sold in 1918 was 191,477 short tons, having an average value of \$10.91 a ton. This was a decrease of 7,000 tons in quantity over 1917, but an increase of more than \$200,000. Vermont produces the largest amount of talc, but New York's output, which comes second, is of greater value; California ranks third in quantity and in 1918 more than doubled the output of 1917. The United States produced about 58 per cent of the world's output in 1918 and imported, besides, 11 per cent of all the talc produced by the rest of the world. About 12,000 tons, 96 per cent of the importations, came from Canada and very little was exported. While there is plenty of low and middle-grade talc in the United States, the high-grade talc used for toilet powder, electric insulators and gas burners, comes from Italy, France, and India.

A new source of talc has been found recently in a dike of serpentine in Hartford County, Maryland. The California production is ground talc, found in Inyo and San Bernardino. There it is associated with limestone, and in part has a fibrous structure like that from the Gouverneur district of New York.

Virginia is the greatest producer of soapstone in the world; she shipped more than 15,000 tons in 1918. California also produces some soapstone.

BUSINESS MEN OF MILWAUKEE, WISCONSIN, where the foreign element is very much in evidence, have formed the American Constitutional League, with Frank R. Bacon, president of The Cutler-Hammer Manufacturing Co., as chairman. The League proposes to be non-sectarian and non-racial in membership and objects; it will devote itself to the work of Americanization in education and in publicity and to opposing all radical doctrines which threaten existing order.

BOLIVIA HAS IMPOSED AN EXPORT TAX OF FROM 2 TO 6 PER CENT ON all rubber that leaves its territory.

New Machines and Appliances.

MOTOR DRIVEN TIRE TESTING MACHINE.

This motor-driven tire tester is of the latest design. It is arranged to drive the tires while running against rough surfaced wheels that are provided with cross strips to simulate the conditions encountered on the road. It is equipped with a

THROPP TIRE TESTER.

out, to give the same weight as on the rear wheels.

The bearings on the wheel shaft are roller bearing type, lubricated with compression grease cups. This machine is built to test 34 by 4-inch tires and is equipped with a $7\frac{1}{2}$ h. p. motor. (Wm. R. Thropp & Sons Co., East State street, Trenton, New Jersey.)

HIGH PRESSURE TIRE RETREADER.

This self-contained sectional tire vulcanizer is designed for effective duty and provided with a large factor of safety. The boiler shell is $\frac{1}{4}$ -inch thick and the crown sheet is $\frac{5}{16}$ inch thick and contains six 1-inch tubes. All boilers are tested to 220 pounds hydraulic pressure and given a thorough steam test before being shipped. Two types of burners are supplied, a gas burner or gasoline burner that generates in less than five minutes and will raise 50 pounds steam pressure in 35 minutes.

The molds are all milled in a special machine built for that purpose and are very smooth in finish. The ribbed tread type of mold being the most popular. The highest grade of equipment is furnished with each mold, including a wove fabric bag, spring bar, socket and ratchet wrench.

High-pressure retreaders are made in three sizes, type A-G curing $4\frac{1}{2}$ and 5-inch tires; B-G curing 4-inch tires; C-G curing 3 and $3\frac{1}{2}$ -inch tires. (Zweibel Bros. Co., Milwaukee, Wisconsin.)

TIRE RETREADER.

COMBINATION TREAD ROLLER, PEELER AND APPLIER.

This machine combines a tread roller that will not only apply and roll down the built-up tread or "camelback" in one operation but will also peel the old tread from the tire that is to be rebuilt.

It is substantially made, having a heavy frame post on which the head of the machine pivots and swings to one side while applying the tire. The head of the machine is then swung around in place, locked, and the pressure screws adjusted.

As a tread roller it will apply and roll down the raw stock at the same time, forcing all air away from in front and eliminating chances of trapping it, as the pressure is put on at the same time the tread comes in contact with the tire. As a tread peeler it will remove the old or worn tread from a tire in a short time.

TREAD ROLLER.

TREAD PEELER.

The driving power is back-geared "three to one" so that a sufficient pressure can be applied in rolling down the raw stock and power gained for peeling off the old tread. Both tread peeling and tread rolling attachments have regulating springs which automatically adjust the roller to the high and low places, keeping an even pressure on the tread regardless of how unevenly it may be worn or how rugged the non-skid design may be. (The Western Tire & Rubber Works, 321 North Crawford avenue, Chicago, Ill.)

WATER BOTTLE AND FOUNTAIN SYRINGE TRIMMING MACHINE.

The accompanying illustrations show a water bottle and fountain syringe trimming machine and samples of its work. This machine does not operate automatically.

A table extending out from in front of machine, 14 by 16 inches, is held in position by two screws. The screw on the right-hand side fits into a slot in the frame which allows the table to be raised or lowered as if it were on a hinge. An upper and lower guard are provided which cover the cutting edges of the cutters and protects the bags. The two guards are adjustable. The space between them is for the overflow to enter.

WATER-BOTTLE AND FOUNTAIN-SYRINGE TRIMMER.

In operating, the bag or bottle is laid on the table, and the table raised or lowered to bring the overflow line of the bag level with the point of contact of the cutters. The bags are then moved over the table similar to cloth passing through a sewing machine. The machine is practically fool proof and will remove 90 per cent of the overflow. Here may be seen the actual work performed

METHODS OF TRIMMING.

on the machine. The method used in trimming the first bag shows the trimming was started at the lower corners (the upper corners shown in cut) on a straight line with the side and the overflow removed up to within a half inch of the

neck. On the second bottle, the trimming was started about $\frac{3}{4}$ -inch from the neck and the overflow removed up to within $\frac{1}{2}$ -inch of the hanger on each side.

In the first method, with a little practice, from 12 to 15 bottles can be trimmed per minute. The second method takes a little more time, but removes more overflow. With more skill the result should be nearly the same. The third shows the syringe bag before being trimmed, and the fourth shows it after being trimmed. About 98 per cent of the overflow has been removed.—(T. W. Morris, 3304 Warren avenue, Chicago, Illinois.)

STANDARD COOLING AND DRYING RACKS.

The rubber stock cooling rack shown herewith is designed to save time, facilitate handling, economize floor space and increase production.

It has a cooling capacity of about 400 pounds of tire stock with each loading, or about 800 pounds per hour. The size is $30\frac{3}{4}$ by $30\frac{3}{4}$ by $62\frac{1}{2}$ inches high, receiving 12 removable trays 30 by 30 inches. The trays are 16-gauge perforated steel with corner angles and 2 by 2 inch tray runs and 1 by 1 inch angle well reinforced.

COOLING RACKS.

DRYING RACKS.

The drying rack is designed for drying jelutong and pontianak stock, etc., and is particularly adapted for use in drying rooms. Its capacity is about 600 pounds of stock when filled. Its size, 64 by 30 by inches by 7 feet 11 inches high. The corner angles are

2 by 2 inches, and the frames heavily reinforced to receive 15 trays 30 by 60 inches. Tray runs are pitched with the tray stops. The trays are 1 by 1 by $\frac{1}{8}$ -inch frame of heavy wire mesh, galvanized after weaving. (Chas. W. Carl's Sons, Trenton, N. J.)

RUBBER THICKNESS GAGE.

A most convenient and accurate dial pocket gage for use in measuring the thickness of calendered sheet rubber stock is that shown in the illustration. It is equipped with jaws which have large flat surfaces designed for gaging paper or rubber. It is graduated to read by 0.001 of an inch. The diameter of the dial is $1\frac{3}{8}$ inches, and the spindle has a travel of 0.3-inch. (B. C. Ames Co., Waltham, Massachusetts.)

POCKET RUBBER GAGE.

INNER TUBE PATCH BUFFERS.

These devices are recommended for quickly and thoroughly removing chalk, bloom and grease from inner tubes preparatory to the application of rubber patches.

These buffers are made in two designs as shown in the illustrations, the Cordell is more effective but the Nugent occupies less space and therefore may be

CORDELL BUFFER.

NUGENT BUFFER.

preferred. The principle is the same in both—small sharp-toothed projections that will clean the surface and not cut the tube deeply. (Cordell Manufacturing Co., 709 Pine St., St. Louis, Missouri.)

COAL HANDLING CONVEYORS.

The scoop conveyor shown in the illustration provides a convenient, efficient and flexible arrangement for handling coal or similar material. For example: five machines may be used to unload coal from hopper bottom cars direct to a storage pile. Each is equipped with its own electric motor and can be operated singly if desired. The first machine is practically self-feeding from the hopper doors of the car, and the other four may be swung around at any angle to cover a wide storage area.

These machines can also be used to convey the coal direct from storage pile into boiler room, or when desired, one machine can be used to load an electric storage battery truck to convey the coal directly into the boiler room.

The advantage of using the scoop conveyor to unload hopper bottom cars is that no track hopper or pit is necessary, making it possible to unload cars at any point along the track. (Portable Machinery Co., Inc., Passaic, New Jersey.)

PORTABLE SCOOP CONVEYOR.

SANDSTONES FOR RUBBER WORKERS.

One of the best forms of whetstones for keeping in condition the hand knives used in ordinary rubber cutting is the old-fashioned sandstone on which whet the steel with glazing as

RUBBER KNIFE SANDSTONE.

some of the harder sharpening stones do. It also has the merit of being inexpensive enough to permit of extensive factory distribution wherever cutting is done by hand. (Scranton Whetstone and Abrasive Wheel Co., Scranton, Pennsylvania.)

MACHINERY PATENTS.

APPARATUS FOR PRODUCING WATERPROOF FELT.

The object of this device is to produce waterproof felt suitable for a substitute for leather in the manufacture of soles, suitcases, trunks and the like.

The container *A* is provided with a specially arranged screen *B*, between the convolutions of which the rectangular sheets of felt, one quarter of an inch thick, are placed. When a vacuum is created in the container by means of a pump connected to the vacuum tank *C*, the waterproofing material is admitted to the container from the tank *D*, and impregnates the felt. After a short period the waterproofing material is forced back into the solution tank, the impregnated felt sheets are removed from the container, pressed and submitted to a drying process. (Charles T. Dickey, Elizabeth, assignor to John J. Voorhees, Jersey City—both in New Jersey. United States patent No. 1,315,763.)

 1,325,465. Manufacture of reinforced pneumatic tires. C. T. Dickey, Elizabeth, assignor to J. J. Voorhees, Jr., Jersey City—both in New Jersey.
 1,325,716. Manufacture of portions of a garter. R. Gorton, Brookline, Mass.
 1,326,620. Waterproofing of garments, including seams and stitching. W. S. Barker, Cambridge, assignor to A. J. Tower Co., Boston—both in Mass.

RATES HAVE BEEN FIXED BY THE UNITED STATES SHIPPING BOARD for shipments of tires from Pacific ports to Hongkong, Shanghai, Kobe, Yokohama and Manila, effective December 15, 1919. Rubber tires, pneumatic or solid, in packages, will pay at ship's option 3 1/2 cents per cubic foot.

New Goods and Specialties.

CORD TIRE WITH NON-SKID TREAD.

ONE of the newer cord tires is illustrated herewith, having the appearance of strength and durability and being provided with an attractive non-skid tread. This tire is hand-built and carries with it a mileage guarantee of 10,000 miles, provided the purchaser has complied with the recommendations of the manufacturer with respect to style of rims used, amount of air pressure, weight of load, etc. (The Biltwell Tire & Rubber Co., Akron, Ohio.)

BILTWELL CORD.

"HILO" FLEXIBLE VARNISH FOR RUBBERIZED FABRICS.

Automobile topping and similarly rubberized fabrics are expected to endure long and trying service under a wide range of climatic exposure from wet to dry and cold to hot, as well as sharp folding and mechanical abrasion. Such service conditions are particularly severe on the varnish surface coating which acts both as a lustrous finish and protector to the rubber composition and as water proofing.

A standard finish for this purpose is "Hilo" varnish which has found extended favor with makers of automobile topping because of its flexibility and resistance to cracking under service conditions. (Hilo Varnish Corp., Brooklyn, New York, and Chicago, Illinois.)

A COVERING FOR PORTABLE ELECTRIC CORD.

A new kind of covering for portable electric cord is woven like fire hose in thick, heavy strands, with each strand of the warp locked in place by the strands of the weft that run around the cord horizontally. After being woven, this heavy cord is impregnated with a high grade of rubber compound which insulates it far beyond the ordinary requirements and makes it adapted to the use of shipbuilders, miners, manufacturers, railroad men, etc. (Tubular Woven Fabric Co., Pawtucket, Rhode Island.)

"DURACORD" ELECTRIC CORD.

A NEW BICYCLE TIRE.

Simultaneously with the celebration of the silver anniversary of the pioneer manufacturer of bicycle tires, the same concern is putting on the market a new tire for the two-wheeled roadster which bids fair to come into its former popularity with both sexes.

"EVERLAST TWIN GRIP" TIRE.

This bicycle tire is all white and is expected to stand hard service, while its resiliency, it is claimed, will protect the rider and his wheel against hard road shocks. The tube is built around two plies of long-staple motorcycle white rubber. (Kokomo Rubber Co., Kokomo, Indiana.)

THE "SUCTION GRIP" LADDER FOOT.

Among the various safety feet for ladders is one with suction grip for smooth floors. It is one of a set of different kinds of safety feet that this manufacturer has devised to adapt ladders to the different kinds of surfaces on which they are to be used. This particular foot has a rubber suction cup on the bottom which makes it grip the floor more firmly when increased weight pushes against it. It is attached by a bolt to the malleable iron holding frame on the ladder and is interchangeable with the others of the set which includes a steel point for rough wood floors, a point based on the abrasive principle for concrete floors, and the one shown in the illustration ready for attachment. (Chesebro, Whitman Co., Inc., First avenue, corner of 64th street, New York City.)

LADDER GRIP.

A CONVENIENT TIRE TOOL.

A self-adjustable tire tool that works with a rack and pinion movement is illustrated here. There is a reversible ratchet on the handle and a rear pawl which engages with the ratchet wheel when the front pawl is in neutral position. By working the handle back and forth until the rim is collapsed the desired tension, the tire will come off easily. The new tire is adjusted with equal ease. (The Trexler Co., 1418 Walnut street, Philadelphia, Pennsylvania.)

THE "TREX" TIRE TOOL.

"VULCANIZE IT."

A patch material for repairing automobile, motorcycle, and bicycle inner tubes and casings; hot-water bottles; rubber boots, shoes, gloves, and coats; garden hose; and bath-room and hospital rubber goods of all kinds is called "Vulcanize It." It is self vulcanizing and is applied with a chemical compound which comes with it. (Allied Manufacturers Corp., 38 South Dearborn street, Chicago, Illinois.)

A BLACK AND GRAY CORD TIRE.

The cord tire with black tread and gray side-walls shown in the accompanying picture is one of the newer ones to appear on the market.

It is made by the single-cure wrapped process by a secret method of construction that obviates the necessity of using air-bags, and each separate cord is first impregnated with high-grade rubber, then heavily coated with rubber, the first ply being also coated with a special rubber compound. (Bergougnan Rubber Corp., Trenton, New Jersey.)

BERGOUNGAN CORD TIRE.

REINFORCED PEDAL RUBBER.

A new rubber for application to motorcycle pedals has been patented by the inventor under date of October 28, 1919. It consists of a pedal cover of high-grade red or gray rubber, with knurled surface, reinforced by a coil of tempered steel wire running its length. The usual round hole is provided, but this pedal rubber can be had with a square hole if preferred. (Continental Rubber Works, Erie, Pennsylvania.)

A NEW PEDAL RUBBER.

"KWIKFIX" RUBBER CEMENT.

The United States Patent Office has granted registration of the trade mark "Kwikfix" to designate a rubber compound used as cement. The application was Serial No. 117,016, noted in our issue of July 1, 1919, and the patent is No. 127,446, granted November 11, 1919. (Alick Merriman, 26 South street, Freehold, New Jersey.)

TWO MORE CORD TIRES.

Two new cord tires, one of which is a super-oversize, are pictured herewith. The Martin super-oversize tire, it is claimed, has unusual resistance to road shocks, bruises, overloading, etc.

MARTIN
SUPER CORD.

The "Mono" cord tire is a pneumatic and is guaranteed free from imperfections in material and workmanship if used under reasonable conditions, with proper rims and pressure. (The Martin Tire Corp., 51st street and Sixth avenue, New York City.)

"MONO"
CORD**STANWOOD HEEL PLATE.**

In our issue of January 1, 1919, we described an accelerator foot-rest and in our issue of September 1, 1915, a step-plate, both produced by the same manufacturer. The step-plate now has a companion in a heel-plate intended for use back of the accelerator foot-rest. This heel-plate is smaller than the step plate, but, like that, comprises a perforated metal plate entirely covered with rubber and provided with a series of longitudinal ribs firmly molded to the metal plate. It is four inches wide and eleven and one-half inches long. This plate, which is intended to furnish a stable position for the heel when operating the pedal, may also be used as a toe and heel guard by setting it in a vertical position on the running-board shield. (Stanwood Equipment Co., 307 Plymouth Court, Chicago, Illinois.)

A RUBBER SNAKE.

Rubber is a favorite material for use in making objects to deceive the eye into believing them to be the real thing, and it is utilized in the manufacture of the figure toy shown here. The body is elongated and hollow, and the head has the mouth wide open. A flexible diaphragm operates the tongue, connected with a rubber band or light spring within the body. By squeezing the body air is forced against the diaphragm

RUBBER TOY SNAKE

and the tongue projected, producing a very life-like representation of a snake. (John W. Clements, Dalton, Georgia.)

A NEW CASING PATCH.

For the repair of cord or fabric ruptures a practical adhesive casing patch has been devised, consisting of four plies of high-grade inner-tube stock and one of rubberized stockinet. Between the third and fourth plies is set a piece of flexible wire mesh cut on the bias. The illustration shows the patch before it is molded and vulcanized, after which one side is coated with cement, protected by a gauze liner. The armored casing patch is stuck smoothly over the rupture so that both ends of it overlap the bead of the tire. It can be used as a blow-out patch. (Squires Tire & Rubber Co., Inc., Long Island City, New York.)

CORD TIRE PATCH.

"FIRO" SUPERHEAT PACKING.

A packing for which it is claimed that it will not burn or char in a joint or squeeze out when the bolts are drawn up is called "Firo." It is made of long, strong fibers of asbestos, with a suitable binder, and is formed into sheets under immense hydraulic pressure. It is supplied in sheets 1/32-inch, 1/16-inch, and 1/8-inch thick, weighing 3 1/4 pounds, 6 1/2 pounds, and 13 pounds, respectively.

"TRIPLE DIAMOND" RUBBER BELTING.

A new kind of rubber belting is made of heavy, specially woven belt duck of considerable tensile strength. It has the plies united by rubber friction which the manufacturer claims will not separate in service. The surface is high-grade friction. This brand takes its name from the trade-mark, three overlapping diamonds, with lettering, stamped on the material.

Both the "Firo" superheat packing and the "Triple Diamond" rubber belting are made by the same concern. (New York Belting and Packing Co., 91 Chambers street, New York City.)

DETACHABLE HEEL.

A detachable and interchangeable rubber heel is shown in cross-section in the accompanying drawing. It is intended to enable a person to attach his own heels without the necessity for visiting a shoemaker whenever it is desired to substitute another heel for the one on the shoe. The lower section of the heel is of rubber, having molded sockets for the accommodation of metal studs which extend from the metal plate that attaches to the heel of the shoe. (George Schrade, 311 Stratford avenue, Bridgeport, Connecticut.)

PATENTED REMOVABLE HEEL.

SURE FOOTING ON THE RUNNING BOARD.

A new style of safety step-plate is so planned that a red rubber insert can be made in the center, having the name of any popular make of car molded therein. The ribs run out from the center like the sun's rays, and the mat provides a sure footing on the running board of the car, in addition to keeping clean the inside.

TYPE D "TYMCO" STEP PLATE.

(Tyler Manufacturing Co., 64 Pearl street, Boston, Mass.)

INTERESTING LETTERS FROM OUR READERS.

TO THE EDITOR:

DEAR SIR:—I was painfully surprised to read your answer to Mr. McCormick's query on page 148 of the December issue of "THE INDIA RUBBER WORLD." Whatever his motive may have been in writing you, it betrays a low grade of editorial intellect for you to lose your temper as you did. And your slur on the Chinese is particularly stupid. China is a great nation with unlimited commercial possibilities for Americans. Obviously we have nothing to gain by antagonizing the Chinese, but ought to do all we can to make our relations with them even more friendly than they have been.

PAUL H. SCHMIDT.

Milwaukee, Wisconsin, January 3, 1920.

ACCELERATOR INFORMATION.

TO THE EDITOR:

DEAR SIR:—If in keeping with your policy, I am wondering if you will be kind enough to let me have an expression from you on the relative strength of the following organic accelerators as applied to the same compound, the known factors being the compound and the cure:

- (1) Aniline oil
- (2) Thiocarbonyl
- (3) Hexamethylene-tetramine.
- (4) Paraphenylenediamine.

As a concrete example, if the following formula were used taking hexamethylene-tetramine as a standard, using say one pound, what amounts of the other accelerators above mentioned, each in turn, would be required to replace the "Hexa" for the same cure:

Sulphur	2 pounds 8 ounces
Hexa	1 pound 0 ounces
Zinc oxide	5 pounds 0 ounces
Smoked sheets	91 pounds 8 ounces

100 pounds 0 ounces

Cure: Say, 1 hour and 45 minutes at 45 pounds. If this formula and cure will not suffice, then any one which you might be willing to suggest will be greatly appreciated.

What method would you recommend as being the most satisfactory for treating crude rubber (smoked sheets) with paraphenylenediamine?

If a solution of paraphenylenediamine is used:—

- (a) What strength is generally required?
- (b) What length of time would be required to treat the rubber?
- (c) What temperature would you recommend to keep the solution while treating rubber?
- (d) About what percentage of para-phenylene-diamine would the rubber contain after treating and being air-dried?

X.

A friendly rubber chemist comments upon the foregoing as follows:

A categorical answer to the first question is exceedingly difficult, for the reason that it presupposes a method of determining equal conditions of cure. In other words, it involves a definition of the so-called "optimum" cure, about which so much has been written and so little agreed upon. I presume that your correspondent would regard similar conditions of tensile strength and stretch as being indicative of the same cure, as they doubtless are from the standpoint of the practical rubber worker.

With this definition of cure then, the answer to your correspondent's question is, "It can't be done." I don't think the addition of any amount of aniline oil to the formula stated will bring about a tensile strength equal to that obtainable by means of the 1 per cent hexa. I also believe that it would be difficult to duplicate with hexa the physical tests obtained with paraphenylenediamine. In other words, no quantitative equivalent relationship exists for the four accelerators in question.

The situation is precisely similar in the case of the inorganic accelerators. Supposing one were asked to state the numerical relationship between white lead, litharge, lime and magnesia. It can't be done.

In the case of the organic accelerators, it can, however, be stated with accuracy, that their order of potency is in accordance with the order in which they are stated in letter, aniline oil being the least powerful and paraphenylenediamine being the most so.

Regarding the second series of questions as to the conditions of treating crude rubber with paraphenylenediamine, I cannot be of much assistance, for the reason, very frankly, that I do not know the answer to them. I have had very little experience with paraphenylenediamine because I feel that owing to its frightfully poisonous nature, it has no place in the rubber factory. Whenever I am asked regarding the advisability of using this accelerator, I am always tempted to quote Punch's advice to those about to get married: "Don't!"

CHEMIST.

FROM A WELL-KNOWN RUBBER EXPERT.

I have for some time been trying to learn the use of paraphenylenediamine, which is handled successfully by only a few. So far I am not sufficiently informed to give information worth while.

Regarding aniline oil, this material is fast being replaced by other materials because of its bad effect upon the people who handle it. It produces inefficiency from the office to the stable. Under the same conditions these accelerators I think would be used in about the same quantity except the fourth or last mentioned.

Hexamethylene-tetramine.—The results are very good, but it produces an itching that is unbearable.

Thiocarbonyl is also very good when clean, but much of it contains free nitro benzol, which, of course, is dangerous and should not be used. It is used in about the same quantity as the others, but is made safe by careful supervision and cleaned and kept clean throughout. Have had the best of success with it.

Some manufacturers use sulphuric acid in making a material they call by the name of thiocarbonyl. It has been proved to be detrimental in some instances by weakening the fabric, causing blow-outs.

HE ISN'T.

TO THE EDITOR:

DEAR SIR: The alleged confessions of a certain big gambler as chronicled in some of the daily papers describe the fleecing of a wealthy man entitled the "Rubber King." Who is he? Boston, January 1, 1920. I. I. REYNOLDS.

(There are really scores of "rubber kings" in the preferred imaginations of dark-alley word-blacksmiths. Any man of wealth or prominence in the world is eligible. All that is necessary is a paper that will print and pay for the stuff—a few facts (or fancies), a so-called rubber king, unnamed of course, and much white paper is ruined.—THE EDITOR.)

WITH REGARD TO SOLARIZATION.

TO THE EDITOR:

DEAR SIR:—A rubber man in the East sends me a compound for blue rubber that, as I understand it, is to be coated on cloth, then wrapped in muslin and vulcanized in the roll. He says, dry heat. Possibly he means that it should be hung or festooned in a hot-room. The compound calls for rubber, zinc oxide, ultramarine blue and sulphur. The amount of sulphur used is one ounce to the pound of rubber. Now, I can easily put the mixture in solution and spread it, but I am not sure that I wish to make a dry heater.

Out here we have moisture most of the time. I have been told that sunlight will cure surface goods. Is that so, and is the compound just the same as for the dry heat? How can I try this out?

Pasadena, California.

JOHN J. ADAMS

(It is perfectly feasible to cure surface goods by exposure to sunlight. It is commonly called "solarizing." Use $\frac{1}{2}$ ounce of sulphur instead of 1 ounce. Make the solution thin and run

several coats. A little experimenting will give you expertness in the sun cure.—The Editor.)

NEW TRADE PUBLICATIONS.

"THINGS THAT INTEREST FIRESTONE SHAREHOLDERS" IS THE title of a handsome 16-page brochure, bound in boards, which outlines the rubber situation and the tire demand in America and presents the outstanding features of the accomplishments, future plans, plant enlargements, and organization of the Firestone Tire & Rubber Co.

THE APSLEY RUBBER CO. AND THE MIDDLESEX RUBBER CO., BOTH of Hudson, Massachusetts, have issued their price lists of rubber boots and shoes for the season of 1920. These cover the well-known Apsley, Roch-Hill, Granger, Harvard, Deliverer, Hudson, Marlboro and Middlesex brands. As in the lists of other firms, prices average 15 to 20 per cent above those of last season, the advances being due chiefly to the higher costs of cotton textiles and labor.

THE BEACON TIRE CO., INC., BEACON, NEW YORK, ARE ISSUING monthly a four-page trade folder, 9 by 12 inches, printed in red and black, entitled "The Beacon Light."

THE WESTINGHOUSE ELECTRIC AND MANUFACTURING CO. has issued an illustrated pamphlet, "Westinghouse Opportunities for Technical Graduates," which gives in detail the educational system devised by the company for training the graduates of technical schools in the various kinds of work it requires of them. It gives a list of 99 American and 14 foreign universities and technical schools which have contributed 5,000 graduates to its force.
